

CLINICAL FEATURES AND TREATMENT OF DIAPHRAGMATIC HERNIA

Frank B McGlone, M D

and

Kenneth C Sawyer, M D, Denver

The literature about the diagnosis and treatment of diaphragmatic hernia is misleading. It puts too much emphasis on the favorable cases, it stresses insufficiently the poor results due to improper diagnosis or unnecessary treatment. Dramatic results have followed the surgical repair of some diaphragmatic hernias. On the other hand, intractable reflux esophagitis, unfavorable vagal sequelae, and disabling intercostal neuralgia have been seen postoperatively in patients whose diaphragmatic hernias had little or nothing to do with their preoperative complaints.

This paper will briefly review the clinical features of diaphragmatic hernia. It will evaluate the conservative method of treatment and will attempt to clarify the indications for surgical intervention in patients having diaphragmatic hernias.

There are two types of diaphragmatic hernia: the hiatus hernia and the true diaphragmatic hernia. Hiatus hernias can be subdivided into three types: hernia due to congenitally short esophagus, the paraesophageal hiatus hernia, and the esophagogastric hernia. In true diaphragmatic hernia, which is much less common, there is a weakness in the diaphragm, either traumatic or congenital in origin, through which the abdominal viscera can herniate. The etiology of the diaphragmatic hernia includes many factors. The acquired factor of greatest importance is, of course, trauma, which may be direct (that is, a laceration or penetrating wound of the diaphragm, with resultant herniation of the abdominal viscera), or indirect, (that is, occurring after a crushing-type injury or an inflammatory process).

Causes of the common type of hiatus hernia seem to include conditions producing increased abdominal pressure, such as pregnancy, obesity, ascites, straining, the wearing of tight garments, or tumor. Occasionally important in the etiology of diaphragmatic hernia are atrophy of the elastic tissues of the diaphragm, cicatricial shortening of the esophagus, and scleroderma.

REPORT OF CASES

CASE 1—When a 42 year-old man was treated after a serious automobile accident, his chest appeared normal on roentgenograms. A few months later, he began to notice chest pain and marked shortness of breath when he exerted himself. X ray films showed the large hiatus hernia. His stomach and part of the colon had herniated up through the diaphragm into his chest. His symptoms were due partly to the digestive upset resulting from the organs being in the chest, and partly to the dyspnea from the great displacement of the pulmonary capacity.

CASE 2—A moderately obese woman complained of abdominal distress that was worse when she was lying down but was relieved when she got up. The x ray films showed a large hiatus hernia with a tumor mass pressing on the lower portion of the stomach. We felt that the tumor, plus the increased intra abdominal pressure, contributed to causation of the hiatus hernia. At surgery, we repaired the hiatus hernia and removed a large pancreatic cyst. The patient has been asymptomatic since the surgery, even though she has not lost weight.

CLINICAL FINDINGS

Congenital diaphragmatic hernia almost invariably causes symptoms shortly after birth. Physicians must recognize these symptoms early. If the defect is not corrected early, the child will die from cardiorespiratory failure or the secondary effects of intestinal obstruction. Occasionally persons with congenital hernia survive—sometimes to adulthood. Even then, the lesion will eventually produce symptoms at some stage, if not soon after birth.

Esophageal hiatus hernia, by far the commonest type of diaphragmatic hernia of clinical significance, may occur at any age. This lesion seldom produces symptoms before adult life.

SYMPTOMATOLOGY

The symptomatology of diaphragmatic hernia, especially of hiatus hernia, depends on many factors, most of which interfere either directly or indirectly with the motor function of the distal portion of the esophagus and of the thoracic viscera. Factors important in producing symptoms include the size of the hernia, the organs in-

volved in the herniation, the inflammatory component in or around the esophageal lumen, and the degree of reflux esophagitis, as well as the thickness and consistency of the hiatal orifice

The classical symptom is discomfort in the upper abdomen, which is most marked when the patient lies down and which is relieved when he stands up. The usual pain is confined to the epigastrium. Its severity is variable. At times the pain is substernal and may radiate to the left arm, much like the pain associated with coronary insufficiency. To add further to the confusion, the diaphragmatic hernia may occasionally act as a trigger mechanism to produce anginal pain in patients with coronary artery disease. Retrosternal burning and a "sour stomach" are very common complaints. Dysphagia is the second most important symptom. It usually indicates some esophageal distortion or narrowing. This symptom suggests early obstructive phenomena, such as is illustrated in the following case history

CASE 3—Dysphagia developed in an 85 year-old woman during the year before surgery. At first, she was unable to swallow only solid foods, then she could not swallow soft foods, finally she could not even swallow liquid foods. Her dysphagia was accompanied by retrosternal pain that was suggestive of cardiac disease. She lost much weight over a two year period. Esophagoscopy revealed only an inflammatory reaction and stiffness of the lower end of the esophagus, but carcinoma could not be eliminated from the diagnosis. The patient was markedly anemic, although there had been no massive hemorrhage, and she had signs of nutritional deficiency. The roentgenograms showed marked obstruction because of the hiatus hernia. She did well following surgical repair of the lesion.

Besides the complaints already mentioned, there may be any degree of respiratory or gastrointestinal complaints, depending on the organs involved in the herniation. When a large volume of the stomach or intestines is herniated, there may be cyanosis. Postcordial distress is seen frequently when a considerable amount of the stomach has herniated into the chest. If the intestines are involved, there may be various manifestations of intestinal obstruction. On occasion, a complete intestinal obstruction may be the initial manifestation of diaphragmatic hernia. The significant feature of respiratory embarrassment is that it is invariably increased after eating and is severer after eating than after exertion.

CASE 4—A 76-year-old man complained of pain in the upper abdomen, but his most marked symptom was dyspnea with cyanosis shortly after eating. This condition was frequently relieved with belching, and he had a tremendous amount of belching and regurgitation following meals. He had had a massive hemorrhage four years before, but no bleeding since then. After he had operative repair of a hiatus hernia his symptoms were relieved. In the summer of 1952, he had a recurrent massive gastrointestinal hemorrhage from a duodenal ulcer, which was treated by subtotal gastrectomy.

Frequently associated with diaphragmatic hernia are such secondary changes as inhibition of growth in children on a nutritional basis, weight loss in adults because of the patient's fear of eating, and many of the symptoms relating to anemia, such as are present with bleeding from a hiatus hernia. Physicians should give more emphasis to these secondary changes, since many patients

show serious changes that are indirect effects of the primary lesion.

Physical findings are variable and depend on the size of the hernia. As a rule, the physical signs are of little significance, but in extreme cases, if enough of the abdominal viscera are in the chest, very characteristic findings may be elicited on examination.

DIFFERENTIAL DIAGNOSIS

Diaphragmatic hernias are the greatest masqueraders of all abdominal conditions. In a large series of cases, we found that there were usually three incorrect impressions before we made a correct diagnosis. Conditions most commonly confused with diaphragmatic hernias are gallbladder disease, ulcer, carcinoma of the esophagus, and cardiac disease. The physician most commonly makes the correct diagnosis if he is aware of the possibility of hiatal hernia and looks for the symptoms of it. Roentgen examination or esophagoscopy confirms his clinical opinion. Esophagoscopy may reveal evidence of late reflux esophagitis or peptic ulcer. Almost invariably the esophagoscope will pass into the cardia of the stomach without encountering any resistance. It is difficult at times to make the differential diagnosis between carcinoma of the esophagus and esophageal hiatus hernia, considerable difficulty is encountered when the two conditions occur concomitantly. Gallbladder disease in association with diaphragmatic hernia is not an unusual finding, the physician may exercise considerable judgment in ascertaining which of the two conditions is responsible for the patient's symptoms. It is very embarrassing to get no relief of the symptoms after operating on a patient and then to find later that the complaints were due to some other disorder.

Recently, a patient gave a history of having had essentially no symptoms until he suddenly began to vomit blood and to have tarry stools. Fourteen transfusions were necessary to bring him out of shock. A gastrointestinal x-ray examination showed a massive hiatus hernia and a gastric ulcer. An abdominal approach was used at surgery. The lesion appeared to the surgeon and the pathologist to be grossly malignant at this time, so a total gastrectomy was done, three days later when the pathology report on tissues was returned, it showed a benign gastric ulcer with marked inflammatory reaction around it. If the ulcer had not been visualized, the surgeon might have repaired this lesion via the thorax.

TREATMENT

In our experience, all diaphragmatic hernias, especially hiatal hernias, are medical problems until proved otherwise. Medical treatment is very helpful in evaluating the severity of the symptoms. The most important phase of medical therapy is weight reduction, as many patients are obese and even a slight reduction of intra-abdominal pressure will relieve all complaints.

CASE 5—A 45-year-old obese man complained of upper abdominal distress, belching, and heartburn, he felt some discomfort when lying down but felt relieved on getting up. The patient was put on a reducing regimen with small feedings, since his weight was reduced his symptoms have virtually disappeared.

Antispasmodics are valuable, but one should remember that occasionally the stronger antispasmodics may increase the symptoms. The patient should be instructed to avoid strenuous exercise, particularly lifting. Associated factors such as abdominal tumors, should be corrected. Many patients are awakened by severe pain at about 4 or 5 a. m. These patients are instructed to elevate the head of the bed on blocks at least 6 in. (15 cm.) in height if possible. They should also be instructed to sleep on the left side when this relieves the complaints.

INDICATIONS FOR SURGERY

As previously mentioned, most diaphragmatic hernias are medical problems. Surgery is indicated only for complications, the commonest of which is bleeding, either massive or occult, with secondary anemia.

CASE 6—An 82-year-old man had severe anemia, with a hemoglobin level of 6 gm. per 100 cc. There had been no recent tarry stools or massive hemorrhage. He had, besides the anemia, a history of chest pain which was suggestive of coronary insufficiency. The hiatus hernia and ulcer that had been seen on roentgenograms were relieved surgically, and the patient had marked relief of the anemia and of the coronary insufficiency symptoms postoperatively.

The second most common and serious complication is obstruction, which usually occurs at the junction of the stomach and the esophagus, even though a good deal of the stomach may be in the thoracic cavity.

CASE 7—A 65-year-old woman had symptoms of marked dysphagia, regurgitation, and weight loss. She had complete relief of her symptoms after surgical management, and is still living a very comfortable life.

The third indication for surgery is the presence of intractable symptoms. These symptoms are not necessarily related to the size of the hernia, occasionally, a large hernia produces intractable symptoms because of its size. On the other hand, some of the small hiatal hernias can produce pain that is not relieved with ordinary symptomatic therapy. These are usually hernias having a small rigid orifice.

CASE 8—A 67-year-old woman presented very typical symptoms of hiatus hernia. She was very obese, and she would not lose weight. She was operated on because of the intractable symptoms. She was completely relieved even though she maintained her obesity following surgery. At surgery, the dominant finding was a very tight hiatal orifice, and the hernia was firmly implanted in the thoracic cavity.

If the indications for surgery are rigidly adhered to, one will obtain good results, however, when symptoms are not specifically significant, surgery will not usually be helpful and may even be harmful. It is too easy to overlook another lesion in favor of a hiatal hernia, and we feel that the patient should have symptoms or indications sufficiently severe to justify surgery. It is extremely important to carry out complete studies on patients with uncomplicated hiatal hernias because the true cause of the symptoms may lie elsewhere. Many patients with hiatal hernias have no symptoms.

The following history represents one of the cases in which unfavorable results were obtained.

CASE 9—A 52-year-old woman complained of substernal pain that was severest when she was lying down. There was no anemia, weight loss or obstruction. The patient was operated on, but the symptoms were not relieved. There was an early recurrence of the hiatal hernia with the intestinal contents being pushed back up into the thoracic cavity. This type of patient can be managed better on a medical regimen, and in this case it would have been much better had she not been operated on even though symptoms were persistent.

In a group of 38 patients who were operated on, the ages varied from 36 to 87. In this group, the results in five were considered unsatisfactory because of a lack of relief of symptoms. There were two deaths. Both were from pulmonary emboli. It is interesting to note that in both of these instances the approach was subdiaphragmatic, and other abnormalities were treated surgically in addition to the hiatal hernia.

SUMMARY

Diaphragmatic hernia, a very common finding, may frequently present symptoms. The most important symptoms include epigastric discomfort at night relieved in an upright position, dysphagia, which occurs in more advanced cases, and anemia in a high percentage of cases. Surgery should be reserved for patients who have serious symptoms associated with hiatal hernia and particularly for cases with severe complications. If the surgical indications are rigidly adhered to, good results will follow surgical treatment of properly selected diaphragmatic hernias.

1839 High St. (Dr. Sawyer)

Contact Dermatitis From Ointments—With the introduction of many new external medications in the past decade, therapeutic contact dermatitis has become a major problem in the practice of dermatology. A considerable percentage of dermatologic patients have this complication. Four widely used groups of drugs have a relatively high incidence of contact dermatitis. The commonest sensitizers belong to the group of drugs which relieve itching because they have a local anesthetic action when applied to the skin. Among these are benzocaine, surfacaine, nupercaine and others. The antihistamines used locally are a good second among cutaneous sensitizers. Theophorin, pyribenzamine, benadryl, histadyl and others show a rising tendency to produce contact dermatitis. The antibiotics, used locally have a high index of sensitivity. Penicillin, streptomycin and others may cause dermatitis. The sulfa drugs, particularly sulfathiazole, caused many cases of contact dermatitis but fortunately their sensitizing properties became so well known that they are no longer used externally to any degree.

The general pattern of the development of therapeutic contact dermatitis is almost always the same. The medication is used on the local lesion for a variable period of time, from days to months. In the beginning there may be great relief of the symptoms of the original disease. The first evidence of sensitization is usually development of a dermatitis where none was present before, as in anogenital pruritus, or the aggravation of the original dermatitis. Within a matter of days after this local aggravation occurs a dermatitis appears in a rather consistent fashion. The hands and forearms are usually involved early, then the face, especially the eyelids and ears and down to the V of the neck, then the legs and feet. In these areas there is usually an edematous, oozing, itching dermatitis. If the medication is stopped the widespread dermatitis is the first to disappear, with the most recently involved areas being the first to clear, and the originally treated areas being the last to improve.—R. Nomland, M.D., *Therapeutic Contact Dermatitis, The Journal of the Iowa State Medical Society*, April, 1953.

PRIMARY FIBROSARCOMA OF THE SKIN

Coleman Mopper, M D , Detroit

In 1924, primary fibrosarcoma of the skin was distinguished as an entity and separated from other tumors because of its characteristic clinical and histological manifestations by Darier and Ferrand.¹ It is best known as dermatofibrosarcoma protuberans. Binkley² found that this neoplasm was first presented by Sherwell to the New York Dermatological Society in 1890, and Costa³ states that Taylor also reported a case later in 1890. Many names have been given by different authors⁴ to this neoplasm of the skin. The terminology of some authors suggested a benign tumor, while that of others indicated a malignant tumor. Woringer⁵ and Senear^{6d} and his associates called this tumor benign, while Eller,⁶ Binkley,² and others believed it to be more serious.

Over 200 cases have been recorded, including 38 cases that Pack⁷ recently reported. Hoffman^{4b} was of the opinion that general surgeons excised the tumor because of the clinical impression that the tumor was extremely malignant and that the pathological diagnosis of fibrosarcoma, which was usually rendered, greatly overemphasized the degree of malignancy. Binkley² stated that pathologists frequently mistake this tumor for either a neurofibroma or a neurogenic sarcoma or give the diagnosis of fibrosarcoma, not specifying the type. Michelson⁸ reported three different pathological diagnoses of the same tumor. The differences in nomenclature and interpretation of the pathological changes partially account for the apparent rarity of reports in the literature of this tumor.

The commonest sites of this tumor are the abdomen and back, but it has been described on every part of the cutaneous surface except the palms and soles. Once the tumor has developed, it varies greatly in size and shape. An early lesion may take one of several forms. 1 It may be almond-sized. 2 It may grow to be as large as a cantaloup and may consist of several pedunculated parts. Some of these peduncles are connected to the main tumor by a narrow stalk, others are attached by a broad base. 3 It may be a firm, broad, intracutaneous plaque with a small mound-like elevation superimposed. These tumors develop in the cutis and subcutis as small, hard, infiltrating nodules that increase in size and number to form a firm sclerotic plaque. This plaque may extend deeply, may invade the underlying adipose tissue, and has been known to become adherent to underlying fascia. This infiltration acts as a foundation that the protuberant growths utilize for support. The color of the external surface of the tumor varies, it may be the color of normal skin, pink, or red, depending on the vascularity of that particular tumor. The surface at first is smooth, but, later, the elevated growths make their appearance and the epidermis covering the tumor becomes thinned and eroded and, finally, ulcerated. These tumors are generally hard, almost cartilaginous, but may become soft after erosion or ulceration. Early recurrence and rapid growth

often follow incomplete removal. These tumors are usually painless. Hemorrhage may occur during the growth of the tumors, and, eventually, gangrene may result. The only satisfactory method of treatment is complete and wide excision. A considerable zone of normal tissue must be included in the excision to insure a permanent cure. Senear and his co-workers^{4d} state that the lesion is practically asymptomatic and does not affect the general health. Becker and Obermayer⁹ stated that the rare condition of dermatofibrosarcoma is practically asymptomatic and does not affect the general health of the patient nor does the tumor metastasize. Binkley, however, reported several instances in which metastases occurred and cited a case in which the tumor was first noted in 1890, it was excised but recurred five times at the same site. His patient died of tumor metastases in 1928. Hertzler^{4a} described fibrosarcomatous tumors of the skin and stated that these tumors could not be rare as, in 25 years, he found 22 out of 5,000 tumors to be this type. He further stated that complete excision of the tumor results in a permanent cure, that, if recurrence follows inadequate removal, a wide, second excision may still result in a cure, and that, even in cases in which there is regional metastasis, the involved lymph nodes may be removed successfully. Hertzler also reported that, in an instance in which seven operations had been performed for such a neoplasm, the patient was well some 20 years later. Internal metastases have also been reported by other authors.¹⁰ Patients have been recorded in whom this condition lasted as long as 50 years. Several such tumors have occurred in old surgical scars, but these may have been local recurrences.

Lymph node and pulmonary metastases constitute the chief causes of the fatal termination of fibrosarcomas. A most important clinical procedure is the routine roentgenographic examination of the chest in every patient suspected of having malignant disease, including fibrosarcoma of the skin. Saltzman,¹¹ in discussing the prognosis of fibrosarcoma, stated that the prognosis is more favorable when the tumor arises from the skin. He arrived at this conclusion from a study of 80 patients treated between 1936 and 1948.

Lamb, in discussing Binkley's paper, stated that, in dealing with a malignant tumor of this type, excision should be preceded by heavy doses of roentgen irradiation and that wide dissection should be followed by further irradiation. A fibrosarcoma, however, is a highly radioresistant tumor,¹² and I feel that irradiation therapy is contraindicated. Wide excision is a more definitive procedure and insures a cure, provided metastasis has not already occurred. Furthermore, the malignant potentiality of this tumor is extremely low, and, even in known cases of metastases, the life expectancy is quite long. To risk the possibility of a radiodermatitis as a consequence of the large roentgen doses needed for treatment of fibrosarcomas seems unwarranted. Irradiation may result in the ultimate development of squamous cell carcinoma on the damaged skin, which is a much more malignant neoplasm than the original fibrosarcoma.

From the Department of Dermatology and Syphilology, Wayne University College of Medicine.

Because of space limitations all of the bibliographic footnotes have been omitted from THE JOURNAL and will appear in the author's reprints.

Pathological Diagnosis—Mopper and Pinkus¹³ feel that the diagnosis of fibrosarcoma is frequently suggested by the history and physical examination and that histological studies are confirmatory. They were in agreement with Ormsby and Montgomery's¹⁴ statement that differentiation lies midway between the ordinary fibrosarcoma and the dermatofibroma lenticulare, although individual microscopic fields could be selected that resemble one or the other. Examination of several sections of the tumor, however, will reveal the characteristic picture. Basically, the composition is that of a low grade fibrosarcoma, but there may be large lacunas and myxomatous changes.

Cause—The cause of fibrosarcoma is unknown. While trauma has been associated with a number of cases, its incidence is relatively low and may have been only coincidental. Binkley² theorized that, because of the unusual predilection of these tumors to be located near the right or left of the midline, there was possibly a relationship to the embryologic mammary ridge. Many tumors have been recorded that do not conform to this concept, since their location had no relation to the mammary ridge. The possibility of misplaced embryologic mammary ridge tissue must not be overlooked, but in very few cases has the location of this tumor had any relationship to mammary tissue. Also, the absence of epithelial elements in these tumors is a significant argument against this theory.

Degree of Malignancy—This tumor must be considered to be a malignant growth, both locally and systemically. The criteria for malignancy include invasion and metastasis or both, and this tumor satisfies these conditions. Its malignant potentialities are much less than those of a fascial fibrosarcoma, and the long duration of many of these tumors attests to their relatively low malignant potentialities. Several deaths have been proved to be the result of metastases, particularly pulmonary, from fibrosarcoma. Tumors that approach the fibroma in histological appearance are much more benign than the more cellular lesions at the opposite end of the spectrum, namely a spindle cell sarcoma. Regardless of the relative benignity of the individual tumor, if it is not a fibroma, it must be considered to be malignant.

REPORT OF CASES

CASE 1¹⁵—A white man, 41 years of age, had noticed a small area of numbness on his back 20 to 25 years before admission to the hospital. About 10 years before admission three small nodules developed in the medial border of the lesion. These slowly enlarged and coalesced to form the tumor mass present on admission. Examination showed a firm, brownish red, intracutaneous plaque in the region of the left scapula. The lesion measured 7 by 9 cm, was slightly elevated, and showed, at the medial border, a group of nodules that measured from 1 to 1.5 cm in thickness. Histological studies indicated that this tumor stood at the benign end of the spectrum that this peculiar group of dermatofibrosarcoma presents, highly cellular lesions, indistinguishable from spindle cell sarcoma, are at the other end.

CASE 2¹⁶—A 49 year-old obese Negro woman had a nodular tumor on the anteromedial aspect of the left thigh. The lesion was reddish, measured 5 by 3 by 4 cm, and was composed of several confluent protuberances. The skin covering the tumor was thin and shiny, with dilated blood vessels. The skin for a distance of 2 cm around the base was infiltrated by a firm plaque that extended into the subcutaneous pan-

niculus. The patient had first noticed a small area of redness in this region nine years before admission. This grew slowly at first and more rapidly in the year preceding admission. Bleeding was serious enough to cause the patient to seek medical assistance. A biopsy and microscopic examination led to the diagnosis of fibrosarcoma of the skin. The tumor was excised widely.

Fig 1—A the tumor in case 1. There were no protuberances and the lesion was primarily an intracutaneous plaque. B the tumor in case 2. This was an early protuberant lesion.

CASE 3¹⁷—The history of this patient was presented to the Detroit Dermatological Society March 15, 1927. This 38 year-old man had noted a small mass on the left side of the forehead some 10 years before. It slowly enlarged, and it was incised and a serous fluid was drained from it. Other masses appeared on the forehead, and these too enlarged. They recurred after excision on two separate occasions. On March 15, 1927, there were firm, nodular masses surrounding the scar left by the excisions and an erythematous tumor at the border of the scalp. The surface of the nodules was telangiectatic. The pathologist reported the tumor to be a nonencapsulated cellular fibroma, suggestive of fibrosarcoma. The photograph of this patient (fig 3) was taken some time after he was presented to the society. The clinical aspects of this case are very similar to those in a case reported by Costa.³

CASE 4—A Negro man, 67 years of age, was admitted to Detroit Receiving Hospital on Dec 12, 1946. He stated that he was in perfect health until nine months before, when a

Fig 2—A the tumor in case 3 which is an unusual demonstration of the protuberances that sometimes occur in this disease. B the cantaloup-sized tumor on the right upper arm of patient in case 4. Note lymph node enlargement from metastases.

small tumor developed on the right upper arm. It progressively enlarged. Examination revealed a large, fungating growth about 2.5 in (3.8 cm) in diameter and approximately the shape of an orange. It was located on the lateral aspect of the

right upper arm near the shoulder joint. This fungating mass was a bright reddish purple color and was attached to the skin on a broad base. This tumor was excised on Dec 17, 1946, and there was some gangrenous tissue below the tumor that extended down to the deltoid muscle but did not involve it. The diagnosis rendered after pathological examination was myxofibrosarcoma.

This patient was admitted to the Wayne County General Hospital in December, 1947. Examination at that time revealed a large lobulated mass on the right shoulder girdle. The skin surface was ulcerated. The mass measured 13.5 by 11.5 by 11 cm. It was attached by a constricted, broad pedicle measuring 9 cm in diameter. Several large axillary nodes were palpated. The right arm was amputated above the tumor. After study of the tissue the diagnosis of metastatic, highly malignant myxofibrosarcoma was made. A roentgenogram of the chest made on Oct 20, 1947, showed no evidence of pulmonary metastases. There was no bony involvement.

The patient was readmitted on May 4, 1948, to the Wayne County General Hospital. At that time there were several nodules at the site of the amputation. A roentgenogram of the chest made on May 4, 1948, showed multiple metastases. The patient died of uremia on May 30, 1948. Slides of the tumor sections that were made in December, 1946, were reexamined recently and interpreted as being, in some fields, an example of primary fibrosarcoma of the skin. Other microscopic fields showed more edema, while others showed inflammatory foci secondary to ulceration and infection. Several areas showed a liberal sprinkling of multinucleated cells, but this did not change the diagnosis. The protuberances of the lesions were certainly quite visible in these sections.

CASE 5—This man had had a growing mass at the base of the left side of the neck for the seven or eight months preceding admission. It had grown quite rapidly in the last two months before admission. The tumor was in an area from

Fig 3—Patient in case 5. Note intracutaneous metastatic lesion.

which a similar growth had been removed some 37 years previously in Greece. The patient at that time was 15 years old. His general health had otherwise been good. Physical examination revealed at the base of the left side of his neck, anteriorly, a firm mass that was larger than a fist. No pulsation was felt. Roentgenographic studies showed a soft tissue mass, no bone destruction, and a normal chest.

The tumor was excised on Feb 12, 1948, and the skin was found to be involved with several tumor nodules. The pathologist reported that this tumor was a spindle cell sarcoma, probably of neurogenic origin, and that it was apt to recur locally but not apt to form metastases. Postoperatively, the patient was given 36 deep x-ray treatments. He was readmitted to the same hospital on Aug 11, 1949, with a large fungating mass.

Fig. 4—High power magnification of a cellular section of primary sarcoma of the skin.

on the left side of the neck and chest that had recurred just eight months previously. There was moderate ulceration and bleeding. A biopsy indicated a myxofibrosarcoma. On Oct 10, 1949, prior to surgery, the patient was given thiopental (Pentothal) sodium at 12.15 p.m. He was pronounced dead at 12.17 p.m. Slides of tumor sections were recently reexamined, and interpreted as being compatible with primary fibrosarcoma of the skin. Areas were present that were quite fibrotic, while others showed a marked myxomatous change. Several fields revealed characteristic fibrosarcoma of the skin.

SUMMARY AND CONCLUSIONS

The term primary fibrosarcoma of the skin is preferred to dermatofibrosarcoma protuberans or other previous designations because of its simplicity. This term is also adequate to cover the cases in which protuberant growths are not present. The prognosis of dermatofibrosarcoma protuberans is much better than that of other fibrosarcomas, since its metastatic tendencies are slight and long delayed. It must, however, be considered a malignant tumor.

Fibrosarcoma of the skin has a strong tendency to form large protuberant masses, and wide surgical excision is the treatment of choice. Roentgen or radium therapy should not be employed, as the large doses required may produce a radiodermatitis with possible development of a more serious malignant growth.

ALOPECIA LEPROTICA: ITS RELATIONSHIP TO TRANSMISSION OF LEPROSY

Col Edward A Cleve

and

Col Francis W Pruitt, (MC), U S Army, San Francisco

There is ample evidence that there are distinct clinical variations of leprosy in different world areas.¹ The role of host susceptibility or resistance, racial factors, and climatic and other geographical conditions in producing these variations remains an unsettled problem.² In this paper a correlation will be made between one variant, alopecia leprotica, and the religious customs and folklore of the countries influenced by Buddhism. Fortunately, a natural experiment on babies is found in certain regions of the world where Buddhism is practiced, allowing the leprologist to use babies as a comparative test group of the contagiousness of leprosy, with the babies in the remainder of the world as controls. The basis of the experiment rests in the widespread custom among the Buddhists of shaving the heads of the newborn. Evidence will be presented to show that leprosy is contracted during infancy or childhood and not primarily in maturity.

CULTURAL BACKGROUND

Buddhist priests migrated from China through Korea to Japan approximately 1,300 or 1,400 years ago. With this migration the custom of clipping the scalp of newborn infants was introduced into the latter areas. When the razor became readily available for general use about 200 years ago, the habit of clipping was replaced by shaving the heads. This ritual was performed on the newborn on certain days, namely, at 7 days of age when the infant's umbilicus was believed to be drying up satisfactorily, at 30 days when it was felt that the baby would survive, and at 90 days when solid or semisolid foods were first given. Both boy and girl babies were shaved, the girls until they were 4 years of age and the boys until they were 8 or 9 years of age. In a few instances the custom was practiced on boys to the age of 12.³

The predominant religion in Japan is Buddhism, which is divided into five different sects. The shaving custom is still observed in certain prefectures, especially in the rural areas and among the older age groups. The younger generation, particularly in Tokyo, is not well acquainted with this ritual. Christianity, as yet, has had little influence on this custom in regions where it is extant.⁴

The religious culture in Korea is derived from China, with two predominant religions, Buddhism and Confucianism. Among the followers of each the habit of shaving the head of the newborn is conventional. There is, in addition, a small Christian group. The Formosans migrated primarily from Fukien Province, China. They forced the original native group into the hills and mountainous regions of the island. As a consequence, the predominant religions are Confucianism and Buddhism and the practice of shaving the scalp of infants is universally observed. In China the custom of shaving the head of the newborn is an accepted universal procedure and is performed at 30 and 90 days.⁴

METHODS AND MATERIAL

Leprosariums in Japan, Korea, and Formosa were visited to determine whether the incidence of alopecia leprotica was greater in relation to the total number of patients in the leprosariums of these countries than in other countries where the practice of shaving the scalp of newborns is not observed. Careful examination in each case was performed to rule out baldness from other causes, particularly the typical type of male baldness (alopecia senilis). Characteristically, lepromatous alopecia could be grouped into three types. The first was an almost complete baldness, with only a few patches of hair remaining (fig 1). The second type presented a moth-eaten appearance with scattered involvement of the total scalp (fig 2). The third group showed a patchy involvement, varying in size with intervening areas ap-

TABLE 1—Incidence of Leprotic Alopecia in Inmates of Leprosariums in Some Asiatic Areas

pearing grossly normal (fig 3). The latter type was more difficult to recognize, especially in long-haired females where the involved areas could be easily hidden.

RESULTS

The total Japanese population in the leprosarium situated at Tama Tenshoen, near Tokyo, Japan, was 1,100, of which 700 were males and 400 females. In this institution 589 lepers were examined, including 378 males and 211 females. Of these, 186 of the men and 82 of the women showed typical scalp involvement suggestive of lepromatous origin (table 1).

Two leprosariums were visited in Korea, one in the vicinity of Taegu and the other near Pusan. Of the total

Nationalist Army. At this institution 208 lepers, 137 male and 71 female, were minutely examined. Thirty-five men and 11 women showed lepromatous alopecia. Of the 49 Chinese soldiers examined, 11 were found to have scalp involvement of leprosy (table 1).

Histological verification of the clinical diagnosis was obtained by scalp biopsy in 20 cases selected at random in the Tama Tenshoen Leprosarium. The microscopic picture was similar in all cases, showing marked lympho-

Fig. 2.—Japanese man with baldness with a moth-eaten appearance

cytic infiltration, persistent involvement of the sweat glands, and the presence of varying numbers of macrophages. In 15 of the sections the acid-fast bacillus was

easily demonstrated (fig. 4 and 5). In all sections the lesions were considered lepromatous.

In the final count of 1,369 persons with leprosy examined in three countries (Japan, Korea, and Formosa) where shaving of the newborn's scalp is practiced, 479 patients (35%) were found to have alopecia leprotica. The incidence in the male was only slightly greater than in the female (37% to 32%). The highest incidence, 49% and 38%, was found in the Japanese males and females, respectively (table 1).

Statistics from 11 countries where the custom of shaving the heads of infants is not present (Mexico, Venezuela, Philippine Islands, Sumatra, Egypt, Palestine, Norway, South Africa, Argentina, United States, and Hawaii) have been used in establishing the control group. Of 12,585 patients examined, only 34 were found to have alopecia leprotica. This is an incidence of less than 0.3% (table 2).

In the Philippine Islands there have been no reported cases of alopecia leprotica. In order to contrast the histological sections obtained from patients with this abnor-

Fig. 3.—Japanese woman with the patchy type of baldness

malty, biopsy specimens from the Tama Tenshoen patients were compared with scalp biopsy specimens taken by Manalang from 48 Filipino patients.⁵ In each instance of the latter the microlepromatous lesions extended from the hairline upward, with normal tissue present near the vertex of the scalp. The sections from the Japanese scalps showed a macrolepromatous lesion.

COMMENT

It appears evident from the data presented that the incidence of alopecia leprotica among patients with leprosy is far greater in those countries where shaving of the scalp of the newborn is a common practice than where it is not. In this regard, the striking difference between the microscopic findings in scalp biopsy specimens taken from Japanese with lepromatous alopecia and from Filipinos without this clinical manifestation is of interest.⁶ Large infiltrations of the face and ears, with subsequent loss of eyebrow hair, occur in all races and are a usual occurrence in the disease. The scalp invasion among the natives of Japan, Korea, and Formosa might theoretically

be due to a greater virulence of the organisms, lesser resistance of the scalp, or greater dosage of the organism. These possibilities appear unlikely when one considers the heterogeneity of the test groups and the geographical separation of these groups. The common factor in all cases appears to be the larger dosage of the organism, for trauma (including shaving) with complete removal of the natural protecting barrier of the hair and the inevitable production of small nicks and cuts would appear to predispose to heavy infection. It is clear that scalp infection is external in origin and not vascular from a central focus.

In numerous infectious diseases the etiological agents characteristically escape from the host through the secretions or excretions of the affected organs or glands to infect new victims. In leprosy the pathological involve-

ment of the sudoriferous glands and nerves is well established⁸, consequently, the infectious agent must at some time leave the host through the medium of sweat gland secretions. It seems likely that leprosy is spread in infancy by prolonged and frequent skin-to-skin contact between the child and the person with leprosy. The distribution of initial skin lesions in children at the Culion Leper Colony, Philippine Islands, was found to correspond very closely to those exposed parts of the body that were brought into direct pressure contact when the child was carried during infancy. As a rule, the mother, or occasionally another member of the family, is accustomed to carry the child in her bare arms with her hands, holding it by its buttocks or upper thighs. The most frequent sites of skin lesions found in these children were on both cheeks of the face, the lower posterolateral area of the arms, elbows, and upper medial area of the forearms, the external parts of both buttocks, the upper anterolateral thighs, both knees, and the anterior parts of the upper legs.⁹ With some variation, these areas coincide

fairly well with the most frequently involved areas in adults with leprosy.

The natural history of the transmission of leprosy was given considerable elucidation by the important works of Brazil investigators¹⁰ and Lara.⁹ The former found that the disease developed in over 70% of the children affected prior to the third year. In Culion, Philippine Islands, Lara repeatedly examined 770 children over a period of years in an effort to determine the pathogenesis of leprosy in these cases. The children ranged in age from 1 to 9 years. Lara estimated that at least 50% of exposed children of leprosy persons would show manifestations of the disease by the time they were 5 years old. He felt that the rate was identical for both sexes. This is in marked contrast to the 600 children of nonleprosy employees of Culion Colony. During the past 25 years not a single case

Fig. 4—Biopsy specimen of scalp under low power magnification showing atrophy of hair follicles and lepromatous infiltration.

of leprosy has been found in these children despite yearly examinations. The employees and their families live in close proximity to the colony proper.

Similar evidence that direct contact is necessary for leprosy to be transmitted to children has been found in many parts of the world. In Punjab, India,¹¹ children of leprosy parents are reared separately from their parents. In 30 years only one case of leprosy has developed among these children. Brazil has, for over 20 years, separated infants at birth from the leprosy parent.¹² No cases of leprosy have developed among these infants.¹³ In the Kalaupapa Leper Settlement, Hawaii,¹⁴ the infant was likewise separated from the leprosy parent as soon as it was born. The children were placed in a nursery within

the colony proper and were attended by supposedly healthy Hawaiians (largely relatives of the inmates). The latter were allowed to mingle freely with the inmates as companions and helpers. Later some of the children were released to relatives and others who were supposedly nonleprosy. Of 219 children who were thus studied, leprosy subsequently developed in 10.¹⁵ Possible leprosy was reported in 25 others. It is believed that the nature of care given these children did not exclude recurrent contact with persons with unapparent leprosy.

Human beings afflicted with leprosy, particularly when in the active lepromatous form, are generally recognized as the principal, if not the only, source of infection.¹⁶ An interesting survey of the entire population of two communities in the Philippine Islands was made by Rodriguez and others.¹⁷ They found that the incidence of

Fig 5—Specimen under high power magnification showing a typical lepra cell with lepra bacillus

infection in persons exposed to cases of leprosy in the household was four times the rate in the whole community. One of these communities had a high leprosy incidence rate, the other city a low rate.¹⁸ A Japanese study¹⁹ of 21 villages near Sendai showed a leprosy rate of approximately twice the expected rate. It was found that all 66 patients lived in 44 houses among 53 blood relatives. The other 1,707 houses were free of leprosy. Numerous other observers²⁰ have found that leprosy is not regularly distributed in any infected area,

but tends to occur in groups in certain villages, whereas nearby settlements may escape the disease entirely. In most instances there is an increased family occurrence, whereas some leprosy persons with no family history of leprosy may have a relative admitted with the disease afterward.²¹

Environmental factors are felt to influence the transmission of leprosy. Such variants as a hot, humid climate, overcrowding, poor housing, and insufficient food and clothing have been implicated. Nevertheless, studies conducted in areas in both the Philippine Islands²² and India²³ have failed to support this contention. Regions that were adjacent to each other and that resembled each other in most respects, including climate, housing, diet, poverty and filth, were found to have markedly different prevalence of the disease. A significant number of cases of leprosy have been found among the well-to-do native and European families in Dutch Guiana,²⁴ which would appear to vitiate poor environmental factors as contributing factors.

Evidence to support the contention that leprosy may develop in previously healthy adults does not appear to be nearly as conclusive as that referable to susceptibility in children. The incidence of development of leprosy among presumably healthy adults in close contact with the disease, such as attendants and relatives at various leprosariums, is similar to, but not greater than, the incidence of epidemic foci in the general population. There has never been an instance of transmission of leprosy to any attendant at the Saint Louis Hospital (Paris),²⁵ the Palesco Leprosy Colony (Panama),²⁶ or the National Leprosarium (Louisiana).²⁵ The rate of infection in husband or wife is similar to the leprosy rate for the country.²⁷ It would appear, thus, that conjugal or other intimate adult contact with a leprosy person may have no epidemiological significance. Attempts to transmit leprosy from man to man by inoculation in 145 cases²⁸ failed in every instance but one. The patient in whom leprosy developed had a leprosy son and other relatives with the disease and it is not certain, therefore, that the disease was absent at the onset of the experiment.²⁹ There are, in the literature, a few reports of inoculated infections in isolated instances.³⁰ Hasseltine and others reported a few cases, in which, on the basis of history alone, they felt the disease was contracted by adults.³¹

In view of the rather equivocal evidence as to primary adult infection with leprosy as compared to the much more abundant evidence supporting the development of childhood leprosy, the work of Cochrane³² dealing with the tendency toward regression of leprosy and its self-healing nature in early infection is of interest. The recent report from Brazil³³ corroborates the previously reported findings of regression and in some instances progression of leprosy lesions. About 65% of all children with the disease show healing or resolution of all recognized lesions without recurrence for from 1 to 13 years.³⁴ Almost all of them will show regression for as long as five years.³⁵ It may be postulated that a certain number of cases that are first recognized in adult life may very well represent the reappearance of a lesion that had lain dormant for many years.

SUMMARY

In leprosaniums in Japan, Korea, and Formosa 1,369 patients with leprosy were examined for alopecia leprotica. In these countries the habit of shaving the scalp of newborn infants is a common practice. The lesion was found in 479 patients, an incidence of 35%. This is compared with an incidence of 0.3% reported in 11 countries where shaving the hair of infants is not customary. Evi-

dence has been presented to show that leprosy is contracted by an infant through skin-to-skin contact with a leprosy person. Contraction of leprosy by healthy adults is rare, and most reported cases are open to question. The data presented corroborate the findings of adult immunity and childhood susceptibility. The control of leprosy is effected by the separation of the leprosy person from the infant or child.

TREATMENT OF MELANIN HYPERPIGMENTATION

Aaron Bunsen Lerner, M.D., Ph.D.

and

Thomas B. Fitzpatrick, M.D., Ph.D., Portland, Ore.

Abnormal increases in melanin pigmentation of the skin have always presented a difficult problem to man because of their cosmetic and social significance. Disfiguring pigmentation of the exposed areas may have important and lasting effects on the emotional well-being of the patient. In addition, the quantity of melanin in the skin may determine the status of a person in a given society. To our knowledge little stimulus for the study of the mechanism of melanin formation has resulted from attempts to explain or modify the great variations in pigment seen in different races. Rather, the stimulus for investigation has come from observations on abnormal subjects including patients with Addison's disease, vitiligo, and hyperpigmentation of pregnancy, and from attempts to explain melanin production in plants, insects, and marine animals. As a result of these studies, much is known of the process by which the amino acid tyrosine

results obtained by several dermatologists using this preparation in the treatment of 84 patients with melanin hyperpigmentation.

TERMINOLOGY

Before the presentation of clinical data, the terminology used to describe abnormal conditions of melanin hyperpigmentation will be considered. Only the commoner disorders will be discussed, as a detailed report will be presented elsewhere.³ Throughout this report the term *melasma* will refer to hyperpigmentation occurring usually on the exposed areas, such as the face, neck, hands, and arms, associated in some instances with an increase in serum copper and urinary melanocyte stimulating hormone (MSH).⁴ These changes may be related to increased pituitary gland activity. Among the conditions associated with disorders of hyperpigmentation designated as *melasma* are *chloasma*, *Riehl's melanosis*, *Civatte's disease*, *Addison's disease*, and *chronic malnutrition*. When a known underlying condition is associated with the *melasma*, such as pregnancy or Addison's disease, the terms *melasma (pregnancy)* or *melasma (Addison)* will be used. If no physiological disturbance is evident and there is simply hyperpigmentation of the exposed areas, only the single term *melasma* will be used.

The common term *freckles* rather than *ephelides* will be used to designate the ordinary small, flat, pigmented macules usually seen on areas exposed to sunlight. Microscopically these lesions show or y increased pigment in the basal cell layer without increase in the number of melanocytes. A *cafe au lait* spot indicates an isolated pig-

Fig. 1—Monobenzyl ether of hydroquinone.

is catalytically oxidized by tyrosinase, a copper-containing enzyme, to melanin in the cytoplasm of melanocytes of the skin, eyes, and leptomeninges.¹

Attempts to treat areas of melanin hyperpigmentation have been manifold. Such agents as ammoniated mercury and hypochlorite bleaches have been used frequently but without success. About 14 years ago a group of Negro workers were noted to have depigmentation of the hands after wearing rubber gloves.² It was found that monobenzyl ether of hydroquinone (fig. 1), an antioxidant for rubber, was the active agent that produced the depigmentation. Since then, occasional reports have appeared on efforts to use crude monobenzyl ether of hydroquinone therapeutically to treat disorders of melanin hyperpigmentation. Although treatment was not very successful because of irregular results and sensitization reactions, some dermatologists continued using the drug in ointment form. In the past few years a purified and finely dispersed concentrated preparation of monobenzyl ether of hydroquinone (*Benoquin*) has become available for clinical study.[†] Following is a report of the

Because of lack of space some of the bibliographic references have been omitted from THE JOURNAL and will appear in the authors' reprints.

From the Department of Dermatology, University of Oregon Medical School. The work reported on in this paper was carried out by the authors during the past four years at the following institutions: Western Reserve Medical School, Cleveland; Mayo Foundation, Rochester; Minn. University of Michigan Medical School, Ann Arbor, Mich.; and University of Oregon Medical School.

* In accordance with terminology adopted at the Pigment Cell Conference, New York, 1951, the term *melanocyte* will be used to designate the mature pigment-forming cell thus replacing the older term *melanoblast*.

mented macule, small or large, which shows the same histological picture as a freckle. One or more *cafe au lait* spots may be found in approximately 10% of the population; however, they may be numerous in patients with neurofibromatosis. A lentigo is a small, darkly pigmented macule that occurs on the upper parts of the body and is not related to sunlight. Histologically, there is proliferation of melanocytes at the epidermal-dermal junction, and the lesion may be considered a junctional type pigmented nevus. Lentigo senilis, or senile lentigines, are the "liver spots" usually seen on the dorsal surfaces of the hands and arms of light complexioned persons over 50 years of age. The term nevus will be used to refer to a pigmented nevus consisting of a papule with or without hair that microscopically shows groups of benign melanocytes in the epidermis or dermis. Sharp distinctions among these diagnostic terms cannot always be drawn. For example, while some cases represent transitions between freckles and lentigines, others fall between lentigines and nevi.

CLINICAL CASES AND RESULTS

Brief case histories of the 25 patients treated for melanin hyperpigmentation are presented. Included are 12 patients with melasma, 2 with berlock dermatitis, 3 with nevi, 1 with lentigo senilis, 3 with *cafe au lait* spots, 2 with generalized lentigines, and 2 with freckles. Of these 25 patients, 18 showed a good clinical response. Two became sensitive to the preparation, and treatment was discontinued. In one of these two patients, an excellent depigmenting response was obtained. In most of our patients treated for melasma of unknown origin and *cafe au lait* spots, melanin pigmentation decreased, but this was not as striking as that observed in generalized lentigines, severe freckling, berlock dermatitis, and melasma (Addison).

Total	84	64	20

In the table are seen the results of treatment in 84 cases of melanin hyperpigmentation, consisting of the 25 patients treated directly by us and 59 by other dermatologists, using a 20% monobenzyl ether of hydroquinone ointment locally twice daily until the desired effect was obtained. Lower concentrations were used in some instances. In addition to the 2 patients of ours in whom

a sensitization reaction developed, 9 of the 59 treated by other dermatologists showed a similar response. Five of the nine patients who contracted a dermatitis showed good depigmentation. One patient, who was later given a 5% monobenzyl ether of hydroquinone, had no further difficulty.

CASE 1—A man, aged 28, had melasma of the forehead and neck of approximately five years' duration, was treated for five months with definite decrease in pigmentation, and showed no sensitization reaction.

CASE 2—A woman, aged 33, had melasma of the face for 14 years, was treated for eight months with some decrease in pigmentation, and showed no sensitization reaction (fig 2).

CASE 3—A woman, aged 34, had melasma of the face for one and one half years and was treated for seven months with definite improvement, no dermatitis developed.

CASE 4—A woman, aged 35, had melasma of the face for about 10 years' duration, was treated for two months with some lightening of skin color, and showed no sensitization reaction.

CASE 5—A woman, aged 59, had melasma of the arms and was treated for three months with questionable improvement, no dermatitis was noted.

CASE 6—A woman, aged 31, had melasma (pregnancy) of the cheeks, upper eyelids, and nose, of six years' duration, was treated for four months, and showed no results and no dermatitis.

Fig 2 (case 2)—Patient with melasma before and after eight months of therapy.

CASE 7—A woman, aged 27, had melasma of the face of six years' duration. After one month's therapy dermatitis developed and treatment was discontinued. There was no improvement and no sensitization.

CASE 8—A woman, aged 49, had melasma of the face. After one month of therapy, patient showed improvement and no sensitization reaction.

CASE 9—A woman, aged 40, had melasma of the forehead and cheeks of three years' duration. After three months of therapy there was definite improvement and no dermatitis.

CASE 10—A woman, aged 48, had melasma of the face and arms of several years' duration. The patient was treated intermittently for four months with improvement. No dermatitis developed.

CASE 11—A woman, aged 39, had melasma of the face of five years' duration, was treated for two months with good results, and showed no sensitization reaction.

CASE 12—A woman, aged 27, had melasma (Addison) of the face and hands, palmar creases, and mucous membranes of four years' duration, she was treated for six months, with excellent results. No dermatitis developed.

CASE 13—A Negro woman, aged 51, had hyperpigmentation on dorsal hand surfaces for several months. The diagnosis was berlock dermatitis or heavy metal melanosis. She was treated for two months with questionable results, there was no sensitization reaction.

CASE 14—A woman, aged 31, had herlock dermatitis of the face of one year's duration and was treated intermittently for one year with excellent results. No dermatitis was noted.

CASE 15—A woman, aged 25, had had since birth melano derma of the back compatible with the diagnosis of a blue nevus. There was marked depigmentation after one month of therapy. No dermatitis developed.

CASE 16—A man, aged 27, had had since birth a flat pigmented nevus approximately 6 cm in diameter on the left side

the patient stated that irritation had developed on applying the drug. She discontinued treatment, and the excellent cosmetic results remained (fig 4).

CASE 25—A woman, aged 28, had numerous freckles on the face and neck since childhood, was treated with 5% monobenzyl ether of hydroquinone for two months with marked improvement, and showed no sensitization reaction.

FEASIBILITY OF COMPLETE BODY DEPIGMENTATION

Since monobenzyl ether of hydroquinone is an effective depigmenting agent when prepared and used properly, a question commonly asked is whether or not it is possible to remove all the pigment from the skin of a darkly pigmented person. In general the preparations reported herein cannot be used for this purpose unless a concentrated effort is made over a long period of time. Even so, results would be questionable, however, in certain special cases complete depigmentation may be practicable, as in patients with vitiligo or those predisposed to this disorder. Evidence from various sources indicates that monobenzyl ether of hydroquinone is much more effective in patients with vitiligo than in persons with normal skin. Two Negro patients who had disfiguring vitiligo of the face and body used these preparations on a single arm for long periods of time and became completely depigmented, except for the hair and eyes, which retained their normal coloring.⁶ One of these patients became pregnant after she was depigmented but still receiving treatment. She gave birth to a normally colored baby. Hence, locally applied monobenzyl ether of hydroquinone does not affect the skin color of the fetus in utero. In a third Negro total vitiligo developed and later began to repigment with small unsightly spots.⁷ She prevented

Fig 3 (case 23)—Patient with generalized freckles and lentigo before and after 20 months of therapy for the face and neck and 5 months for the hands.

of the face. After four months of therapy there was a questionable decrease in pigmentation and no reaction to the drug.

CASE 17—A woman, aged 24, had a pigmented nevus on arm since childhood and was treated for four months. No change and no sensitization were noted.

CASE 18—A woman, aged 65, had lentigo senilis on dorsal surfaces of the hands and arms, was treated for two months with definite improvement, and showed no sensitization reaction.

CASE 19—A woman, aged 21, had a *café au lait* spot on the arm since childhood and was treated for three months, with decrease in pigmentation of the lesion. No dermatitis developed.

CASE 20—A girl, aged 16, had a *café au lait* spot on the arm present since birth, after four months' treatment, there was some lightening of the hyperpigmented area and no sensitization reaction.

CASE 21—A woman, aged 54, had a *café au lait* spot on the cheek most of her life, she showed marked improvement after four months' treatment. No dermatitis developed.

CASE 22—A man, aged 25, had generalized lentigines and was treated intermittently for one year with slight improvement. No sensitization was noted.

CASE 23—A man, aged 28, had marked generalized lentigines and freckles since early childhood with severe secondary neurosis because of the disfigurement. His face, neck, and hands were treated for two years with 33% monobenzyl ether of hydroquinone and then for one year with the 20% ointment. Almost complete disappearance of lesions occurred. No dermatitis developed (fig 3).

CASE 24—A girl, aged 19, had freckles of exposed areas since childhood. Her face and hands were treated for two months with striking improvement. At the end of this period,

Fig 4—Patient with freckles before and after two months of therapy.

appearance of these spots by applying ointments containing monobenzyl ether of hydroquinone. In a fourth Negro who had slight vitiligo extensive vitiligo developed

6 Stolar R. Personal communication to the authors.

7 Schwartz, L. Personal communication to the authors.

following local depigmentation of the legs from a rubber garter, which probably contained monobenzyl ether of hydroquinone.⁸ None of the patients showed depigmentation of the hair or eyes. This may be an indication that monobenzyl ether of hydroquinone does not act directly on the melanocytes but is first converted in the skin to another substance. No knowledge is available on the effect of this medication orally on pigmentation in human beings. In white patients with malignant melanomas treated by Kelly, Bierman, and Shimkin⁹ with oral monobenzyl ether of hydroquinone obvious changes in pigmentation did not develop.

In our experiments⁸ with five normal Negro subjects, 20% monobenzyl ether of hydroquinone was applied daily to one arm for two months without change in pigmentation, however, one subject readily underwent depigmentation in one month on covering the site of application of the ointment with gauze and adhesive tape. Repigmentation was complete two months later. Similar results were obtained when the 5% monobenzyl ether of hydroquinone was used in the same subject.

Fig 5—Results of continuous patch tests on back of Negro male volunteer for one month. Ten per cent monobenzyl ether of hydroquinone was used on the left and 30% on the right.

THERAPEUTIC PREPARATIONS AND METHOD OF TREATMENT

The purity and concentration of monobenzyl ether of hydroquinone and the vehicle and mode of application are important factors in obtaining a good clinical result. It is possible that early work with monobenzyl ether of hydroquinone was associated with sensitization reactions because of the presence of about 10% contaminants. This crude preparation contained dibenzyl ether of hydroquinone and unidentified oxidation products. In addition, the physical state of the material was such that its incorporation in an ointment resulted in a gritty mixture that abraded the skin. The ointment (Benoquin) used in our studies consisted of purified and finely milled monobenzyl ether of hydroquinone.

Patch tests on the skin of normally colored persons¹⁰ showed that the greater the concentration of the drug in the ointment, the more rapid the depigmentation. For example, as shown in figure 5, a 30% ointment was more effective than a 10% ointment, however, almost any concentration from less than 1% to 50% was effective, depending on the frequency of application and unknown factors peculiar to the person. Occupational and acci-

dental depigmentation from rubber gloves, other rubber items, and adhesive tape was obtained with only small quantities of monobenzyl ether of hydroquinone. Some dermatologists prefer a 5% ointment. Most of the patients followed by us were given a 20% ointment, but in some cases the concentration of the drug was 5%. If a given concentration produces a dermatitis, the concentration should be decreased. If necessary, the material should be applied less frequently rather than discontinuing treatment. Stolar⁶ and Horne¹¹ obtained good therapeutic results in patients sensitive to the drug by adhering to these procedures.

Many substances have been suggested as vehicles in which to incorporate monobenzyl ether of hydroquinone for local application, including organic solvents (or mixtures) of acetone, alcohol, and olive oil, ointment bases of petrolatum or water washable substances, pomade sticks, and plaster. Oral use of the drug has been considered. All locally applied preparations, except sticks, which were not tried, can bring about depigmentation. The ointment bases, particularly those that are water washable, are the easiest to use. Alcohol or acetone preparations are too drying for many patients, and olive oil is too greasy. Good results were obtained with 10% monobenzyl ether of hydroquinone plaster in two out of four patients with *café au lait* spots and one Negro serving as a control after three to eight weeks' therapy, however, in two of the patients a dermatitis developed after three weeks' application of the plaster.

As mentioned earlier, although oral preparations were not tried, the drug is not toxic, and depigmentation by this method must be studied. Grupper¹² stated that parahydroxypropiophenone, used orally or locally, could bring about depigmentation but that the combination of both forms of therapy was most effective. Monobenzyl ether of hydroquinone should be investigated for possible similar results.

Ointment preparations are applied to the skin twice daily until depigmentation appears, usually in one to three months. After obtaining the desired depigmentation, applications are reduced to once daily and later once weekly. At times transient burning of 5 to 20 minutes' duration occurs after the ointment is applied. This reaction does not indicate cessation of therapy because symptoms usually disappear after three weeks' use. If a dermatitis develops after application of the ointment, the preparation should be diluted to 1 to 5% and, if necessary, applied less frequently than twice a day. The treatment of a patient in whom sensitivity to the drug develops cannot be clearly outlined but must be managed individually by the physician.

RATE AND DURATION OF DEPIGMENTATION

The rate of depigmentation of a treated pigmented area varies greatly, ranging from three weeks to six months. As stated previously, the concentration of the active agent and the mode of application, as well as factors peculiar to the person, are important. Adhesive tape or other types of occlusive covering over the ointment-treated areas result in more rapid and complete depigmentation, however, it is not practical to cover areas such as the face for long periods of time, and these are the regions for which the patient usually seeks treatment.

⁹ Kelly K, H, Bierman H R, and Shimkin M B. Negative Effects of Oral Monobenzyl Ether of Hydroquinone in Malignant Melanoma. In *Man Proc. Soc. Exper. Biol. & Med.* 70: 589, 1952.

¹⁰ Denton C R, Lerner A B, and Fitzpatrick T B. Inhibition of Melanin Formation by Chemical Agents. *J. Invest. Dermat.* 18: 119, 1952.

The more concentrated the preparation, the more rapid the rate of depigmentation (fig 5)

When ointment preparations of monobenzyl ether of hydroquinone are used to treat freckles, lentigo, and melasma, no change occurs in the normally pigmented skin of the fingers used to apply the medication or in the areas contiguous to those of hyperpigmentation. An albino color is not obtained. An exception was a Negro woman with melasma (pregnancy) in whom localized leukoderma of the face developed after the application of a 5% ointment.¹³ Pigmentation returned when therapy was discontinued. It is an interesting phenomenon that, whereas in white patients normal skin pigmentation is not affected, in Negroes not only the abnormally pigmented areas disappear but also the pigment of normal skin. Hence, there is a difference in the total net effect of local application of monobenzyl ether of hydroquinone on Negro and on white skin. Some unknown balance between melanin formation and melanin depletion may operate to explain this phenomenon. In short-term (30 day) tests¹⁰ on Negro patients, no correlation was found between the intensity of their pigmentation and the rate of depigmentation.

The rate of repigmentation after complete cessation of therapy varies from two months to periods of unknown duration. Some patients with occupational leukoderma related to monobenzyl ether of hydroquinone did not regain normal pigmentation. In all our patch test studies with Negroes pigmentation was complete within three months. In patients with freckles and melasma, exposure to sunlight increased the rate of repigmentation. Such patients must be instructed to avoid overexposure to sunlight. Ultraviolet light protective agents are sometimes useful.

MECHANISM OF ACTION

Experimental work has shown that monobenzyl ether of hydroquinone has no action on melanocytes or the tyrosine-tyrosinase reaction, but it may be split to form hydroquinone, which in turn inhibits melanin formation.¹⁰ Fassett¹⁴ believes that this hypothesis is incorrect and that hydroquinone does not affect pigmentation. Whereas persons who handle hydroquinone do not become depigmented, those who work with monobenzyl ether of hydroquinone occasionally do, however, it is known that parenteral administration of hydroquinone produces depigmentation in experimental animals. Hydroquinone is a good inhibitor of the tyrosine-tyrosinase reaction.¹⁰ Inhibition of a metabolic process depends on the presence of an active agent at a specific site. It is possible that hydroquinone does not reach the melanocyte on application to the skin and that monobenzyl ether of hydroquinone is converted at the proper site in the skin to hydroquinone, which in turn can inhibit melanin formation.

OTHER DRUGS

Para-hydroxypropiophenone is the only substance similar to monobenzyl ether of hydroquinone that has been used to effect depigmentation. Both chemicals are parahydroxyphenyl derivatives. Para-hydroxypropiophenone has been used locally and orally in the treatment of melasma (Riehl).¹⁵ Best results were obtained with 1 to 2 gm of the drug orally daily and a 12% ointment

locally. This drug has not been used extensively by us. No depigmentation occurred in Negro patients with patch tests performed similarly to those with monobenzyl ether of hydroquinone that produced depigmentation.¹⁰

Ointments containing ammoniated mercury have been, and are continuing to be, used for removing freckles. The results have been inconsistent. Even when an effect is attained, it is weak and not clear-cut.

At the present time much is known about melanin formation,¹ including the type of cell (melanocyte), the substrate (the amino acid tyrosine), the enzyme (tyrosinase—a copper protein complex), and the chemical steps involved in this process. Because of this knowledge, new methods may be found to inhibit melanin formation, however, at this date, monobenzyl ether of hydroquinone remains the most effective and useful agent.

SENSITIZATION AND TOXICITY

The only toxic reaction to monobenzyl ether of hydroquinone has been sensitization with subsequent dermatitis. No systemic toxicity has been observed. As a patch test, the 20% ointment containing purified monobenzyl ether of hydroquinone was applied to the forearm of 260 normal persons for 48 hours.¹⁰ Three persons (1.2%) showed a mild reaction consisting of localized erythema and edema. Similar testing, using an ointment of 20% crude monobenzyl ether of hydroquinone on 90 persons, resulted in mild reactions in 3 cases (3.3%). Retesting the purified preparation on 135 persons three weeks after the initial experiment revealed no new instances of reactions, however, on retesting the crude preparation on 76 persons, it was found that 3 reacted (4.0%). Thus it appears that the purified monobenzyl ether of hydroquinone is less sensitizing than the crude chemical, however, a greater series of cases would have to be studied to establish this point.

Of 31 persons, including patients and test subjects who applied the ointment for two months under our direct supervision, 2 showed sensitivity to the drug. In one of these (case 2), an excellent clinical result was obtained before sensitivity appeared. Of 59 patients treated by other dermatologists, 9 showed sensitization reactions. Five of the nine patients showed good clinical results, and one maintained a good effect without the development of dermatitis when 5% monobenzyl ether of hydroquinone was used instead of 20%. As mentioned earlier, the plaster preparations produced a localized dermatitis in two out of five cases although the clinical responses were good in that depigmentation occurred. One of our patients (case 23) used various preparations of monobenzyl ether of hydroquinone over the entire face, neck, and hands daily for almost three years. During the past year, he used only the 20% formula. Clinical and laboratory findings were completely normal.

It is interesting that approximately 13% of patients treated with 20% purified monobenzyl ether of hydroquinone showed some type of sensitization, whereas only 1.2% of persons patch-tested with the same ointment reacted on initial testing. No reactions were seen on retesting three weeks later. It can be concluded that patch testing alone does not simulate therapeutic use of these preparations in regard to the development of sensitization. The ointments are diluted from 20 to 5% if *

application results in transient burning or erythema Stolar⁶ and Horne¹¹ obtained good clinical results in patients sensitive to the drug by diluting the preparations and applying them less frequently

Kelly, Bierman, and Shimkin⁹ administered monobenzyl ether of hydroquinone to eight patients with malignant melanomas Total doses of 2.9 to 1,490 gm administered in daily amounts of 0.5 to 25 gm orally for 21 to 214 days produced no toxic effects other than transient nausea and vomiting when the daily dose exceeded 10 gm The growth of the melanomas was not affected Seven of the eight patients died after an expected course of their malignancy Necropsy of these seven failed to reveal histological evidence of toxic effects or other changes attributable to ingestion of the drug No toxic changes were observed in mice receiving 600 mg per kilogram of body weight of monobenzyl ether of hydroquinone intraperitoneally daily for three weeks¹⁰ or in guinea pigs ingesting 160 mg per kilogram daily for two months¹⁰

SUMMARY

Of 84 patients with increased melanin pigmentation treated with 20% monobenzyl ether of hydroquinone (Benoquin), 64 showed a good clinical response after

two to six months' treatment Eleven of the 84 patients (13%) became sensitive to the ointment and reported a local dermatitis, however, 7 of these 11 patients had an excellent therapeutic effect before the sensitivity was acquired

Results obtained on patients treated directly by us showed monobenzyl ether of hydroquinone to be highly effective in generalized lentigines, severe freckling, hyperpigmentation due to photosensitization following use of certain perfumes (berlock dermatitis), and melasma (Addison) Treatment was moderately successful in melasma (pregnancy) but of little or no value in *café au lait* spots or pigmented nevi Other physicians reported good results in melasma (pregnancy) and postinflammatory hyperpigmentation but only fair improvement of *café au lait* spots Mild or moderate freckling should not be treated because these lesions usually fade spontaneously during the winter months and the incidence of sensitization to the drug is relatively high

The feasibility of complete body depigmentation was discussed Factors relative to therapy such as concentration of the drug, type of vehicle, mode of application, duration of treatment, and management of patients with sensitivity were considered

MECONIUM PERITONITIS

Herbert M Olnick, M D

and

Milford B Hatcher, M D, Macon, Ga

Meconium peritonitis is an aseptic chemical peritonitis that follows perforation of the intestines in fetal life Although this condition is infrequent, it should be emphasized that the correct diagnosis can be made on the basis of characteristic roentgenographic findings This is of considerable clinical importance in the surgical differential diagnosis of acute abdominal conditions in infancy A case of meconium peritonitis with the unusual presenting complaint of scrotal swelling is described as well as a typical case

Simpson¹ is credited with the first comprehensive presentation of meconium peritonitis in 1838, in which he reviewed 15 cases and added 9 of his own By 1949 over 100 cases had been reported in the literature²

Occurrence of this disease requires the presence of fetal peristalsis and meconium, both of which make their appearance during the second trimester of prenatal life Boikan³ cites Rudnew's case of a stillborn fetus of six months' development that had meconium peritonitis with calcification When, as in our case 1, a definite obstruction of the intestines can be demonstrated, the pattern of events—hyperperistalsis, thinning of the wall, and

perforation—is readily understood In other instances, weakness of the wall or abnormal meconium is predicted as the prime factor

Meconium is a sterile mixture of cast off epithelial cells, bile, fats, stearic acid, sebaceous material from swallowed amniotic fluid, mucin, and salts When the meconium enters the peritoneal cavity, it creates a vigorous irritation and gives rise to a tremendous adhesive process Calcification occurs at varying intervals from the time of perforation and is usually demonstrated overlying the epithelial cells in the exudate If the intestinal perforation occurs at or near the birth of the baby, surgical exploration will reveal bile, meconium, and probably free air in the peritoneal cavity If the original perforation occurred earlier, extensive adhesions and calcification will be present (fig 1A)

In 50% of the cases of meconium peritonitis, definite obstructive lesions to the wall of the intestine can be demonstrated, such as volvulus, intussusception, congenital bands, angulation and kinks, atresia, and stenosis, the latter two lesions are seen most commonly When a low large bowel obstruction results in perforation, the tear may be found in more than one place and anywhere from the sigmoid to the cecum³ The commonest location of perforation in the small bowel is approximately 10 cm proximal to the site of obstruction Small intestinal stenoses and atresias are commonest in the duodenum and ileum When found in the duodenum, they are usually single, and when found in the ileum, they are not

Dr H S Weens assisted in the study of these patients.

3 Boikan W S Meconium Peritonitis from Spontaneous Perforation of the Ileum in Utero Arch. Path. 9 1164-1183 (June) 1930

uncommonly multiple. The bowel distal to an atresia will usually be collapsed, owing to the fact that meconium has never passed through it.⁴

Conditions other than those obstructing the wall of the intestine can produce perforation. Meconium ileus, congenital diverticula, ulcers and hyperplastic lymph and glandular tissue have been incriminated as factors producing weakening of the wall and rupture in various cases. The role of trauma has not been established.⁵

The existence of the fetus is endangered even before birth by polyhydramnios and by dystocia in labor due to distention of the abdomen and to edema of the abdominal wall of the fetus. The newborn infant is usually acutely ill and cyanotic, vomits frequently, and has absent or scanty stools. At times blood may be present in the stools and vomitus.

X-ray examination is helpful. Distention of the small bowel points to the presence of intestinal obstruction. If the perforation is recent, free air may be demonstrated on upright films of the abdomen. If the perforation has taken place at some previous date, a characteristic streaky and plaque type of calcification may be seen distributed throughout the entire peritoneal cavity, frequently extending over the dome of the liver.⁶

Recent articles have described intraluminal calcifications of a stippled appearance associated with intestinal atresia, in which instances the preoperative roentgenogram misled the radiologist into an interpretation of meconium peritonitis. At operation the peritoneum was clear and the densities were all part of the intestinal contents. This condition may be differentiated on the roentgenogram by the central location of the densities in contrast to the involvement of the parietal peritoneum of the abdominal wall and liver areas in meconium peritonitis.

Surgical treatment is the only recourse in the acutely ill infant. Not only must the underlying lesion causing the perforation be relieved and the perforation closed but the operator is faced with resecting the tremendous number of adhesions that are present in order to expose the lesion. The postoperative course is complicated by these adhesions, which promptly reform and which present the hazard of a recurrent obstruction. Despite the poor outlook, in at least three cases recorded in the literature the patients have recovered following surgery.⁶ Following is a description of two instances of meconium peritonitis that have been encountered during the past few years.

CASE 1—A white baby girl was born on April 24, 1952, following a normal delivery by Dr. O. R. Thompson. The only sibling is normal. The patient's abdomen was somewhat distended. No other abnormality was noted at birth.

During the first few hours of life, the abdomen increased in size and the child became restless. The surgical consultant saw this child at 18 hours of age. Marked distention and dyspnea were noted and seemed to indicate a congenital intra-abdominal gastrointestinal anomaly. A scout film of the abdomen was ordered.

The roentgenologist reported considerable abdominal distention from a distended small bowel and peritoneal fluid. Calcifications were noted throughout the entire peritoneal cavity, extending over the dome of the liver. The barium enema examination revealed the colon to be patent throughout but of small

caliber. Barium given orally failed to enter the duodenum. The close relationship of the gas-filled small intestinal loops in the anterior superior portions of the abdomen was felt to be due to the adhesive and calcific peritonitis. Meconium peritonitis with small intestinal atresia was the preoperative roentgenographic diagnosis (fig. 1).

Laparotomy was done 20 hours after birth through a right rectus incision. The peritoneal cavity was completely filled with a dark green, somewhat mucoid looking fluid, which was aspirated. The peritoneum and the abdominal viscera were thickened by a dark bluish black membrane, apparently old meconium, which made the bowel appear to be gangrenous.

When this membrane was removed, the underlying intestines appeared viable. The stomach and duodenum were markedly dilated and thickened (6 mm) from hypertrophy of the wall secondary to an obstructive thickening in the area of the ligament of Treitz, the exact nature of which could not be determined.

The main finding was an atresia, 1 in (2.5 cm) in length, of the distal ileum just proximal to the ileocecal valve. Just above the atresia the ileum was ruptured, and normal appearing meconium was exuding from the lumen. A small rubber catheter was inserted into the small intestine, and irrigation with isotonic sodium chloride was done to remove as much meconium as possible.

Fig. 1 (case 1)—A meconium peritonitis following ileal atresia. The stomach and underdeveloped colon are outlined with barium. Note the widespread calcifications in the abdomen. B lateral view. Note the collection of gas in the small bowel loops which form a cluster from the matted adhesions. (The white streak in the center is a film scratch.)

An ileocecostomy to bypass the atresia was performed. When the large bowel was opened, residual barium from the preoperative colon study was found. Meconium was absent. An interesting finding at operation was the lighter color of the colon, which helped to distinguish the large bowel. The difference was due to the absence of meconium in the colon and the presence of barium remaining from the enema examination. The obstruction around the ligament of Treitz was bypassed by a gastroenterostomy. The abdomen was anatomically closed.

The patient stood the operation well and the next day appeared to be progressing. Blood, penicillin, and fluids parenterally were administered. Three days following surgery, the patient had a bowel movement and the abdomen was fairly soft. The Wangensteen suction was discontinued, and water was given by mouth.

Five days following surgery, she was given a formula. Two days after a formula was given, the patient began to vomit and her abdomen became distended. The temperature rose, and diarrhea developed. Nine days postoperatively, a fistula developed, and the wound broke down. She continued a downhill course and died on the 13th postoperative day. Permission for an autopsy was not obtained.

This is a fairly typical case of meconium peritonitis secondary to an ileal atresia, which apparently perforated in prenatal life and was still patent at the time of surgery on the first day of life. The x-ray findings in this case were characteristic, and the diagnosis was made preoperatively.

CASE 2—A two month-old Negro boy was admitted to Grady Memorial Hospital on Dec. 12, 1947, with a chief complaint of enlargement of the scrotum. This child had a normal delivery and weighed 7 lb., 8 oz. (3,402 gm.) at birth. Tests of the mother's blood for syphilis were negative.

At the time of delivery the scrotum was noted to be markedly swollen. In the two months since birth the scrotum had diminished to one half its previous size but was still three to four times normal size. The child was asymptomatic in every other respect and was gaining weight normally. There were no other physical findings except for the enlarged scrotum. Results of laboratory studies, which included determination of the blood calcium, serological studies, and duodenal trypsin studies, were noncontributory. The suggested clinical diagnoses included bilateral epididymitis and orchitis, syphilitic orchitis, teratoma, and bilateral hydrocele.

Intravenous urography revealed numerous mottled and stippled areas of calcification in both sides of the scrotum in the deep tissues surrounding the testicle and epididymis (fig. 2). One of the radiologists (Dr. E. T. Walker) noted numerous areas of calcification within the confines of the peritoneal cavity extending above the dome of the liver (fig. 3). Roentgenographic studies of the entire body revealed no other areas of calcification. The conclusion was that this child had had a perforation of the intestine during fetal life resulting in spillage of meconium into the peritoneal cavity, with spontaneous sealing of the opening. The clinical and x-ray findings were the residual changes of meconium peritonitis, which occurred during fetal

Fig. 2 (case 2)—Bilateral peritesticular calcification secondary to meconium peritonitis in a two-month-old infant. Note the scrotal enlargement.

life when the main peritoneal cavity and the processus vaginalis to the scrotum freely communicate. Normally this communication ceases within a few weeks to a few months after birth.⁷

A biopsy of the testicular mass was performed on Jan. 9 at 2½ months of age and showed 'loose fetal connective tissue with slight acute and chronic inflammatory cell infiltration and some areas of calcification'. Follow-up clinical examination in the outpatient department up to the present time has revealed no further trouble except for one brief episode of scrotal swelling, which quickly subsided. A repeat roentgenogram taken in August, 1952, at 5 years of age showed considerable diminution in the amount of calcification.

Fig. 3 (case 2)—The arrows indicate calcifications of peritoneum in liver area.

This case is unique in that the child had no intestinal symptoms and was hospitalized because of scrotal swelling. The basis of the scrotal abnormality was described by Simpson¹ in case 4 of his original presentation: "Both the tunicae vaginales of the testes still communicated with the cavity of the peritoneum and the serous surface of the left one was partially coated by a layer of coagulable lymph." No known disease entity other than meconium peritonitis can account for these calcific foci in the scrotal, abdominal, and liver areas of our patient.

SUMMARY

The disease entity, meconium peritonitis, is reviewed, and a typical case is described. A case of scrotal enlargement with calcification in the peritesticular tissues and with calcifications in the peritoneal cavity, all believed due to meconium peritonitis in prenatal life, is also described. This second case is unusual because the child is completely asymptomatic as far as the intestinal tract is concerned. This is the first case on record of meconium peritonitis causing calcification in the scrotum.

CLINICAL PROBLEMS RELATING TO THE MANAGEMENT OF INFECTIONS WITH ANTIBIOTICS

Wesley W Spink, M D, Minneapolis

Any physician who was responsible for patients with bacterial infections prior to the introduction of the sulfonamides and the antibiotics can readily appreciate the advantages that these therapeutic agents have brought about in the management of infectious diseases. One could dwell at length on the change in the clinical pattern that has resulted from modern antibiotic therapy in each of several infectious diseases. Consider the natural course of untreated hemolytic streptococcal septicemia, with its previous mortality of over 75% as compared to that of less than 10% existing today because of these advances in treatment. Gonorrhea can be successfully treated overnight, and no longer are hospital beds filled with patients having debilitating and chronic complications resulting from this venereal disease. Some of the most remarkable therapeutic triumphs involve patients with such diseases as subacute bacterial endocarditis or pneumococcal meningitis, in which recovery of an untreated patient is extremely rare.

Although revolutionary advancements have occurred in the management of infectious diseases, the clinician is often perplexed by those infectious processes that fail to respond favorably to the antibiotics, paradoxically, the antibiotics have brought forth new clinical problems. At this point it is well to review some of the unsolved clinical problems in the management of infectious diseases and to consider some of the disadvantages induced by the widespread use of the antibiotics.

SOME PROBLEMS CREATED BY ANTIBIOTIC THERAPY

One or two basic therapeutic principles should govern the clinician in his use of the antibiotics. Either as a result of precise laboratory data or on the basis of adequate clinical experience, he can decide that a given patient is suffering from a specific infectious disease. Oftener than not information is available to determine whether an antibiotic is indicated in such a disease, if so, the antibiotic should be used that has been shown to be the most effective. Unfortunately, as simple and as sound as these principles are, many clinical problems are created by the indiscriminate use of the antibiotics in such situations. A current pernicious therapeutic philosophy is based on the following conclusions: 1 The antibiotics are highly effective for many common bacterial infections. 2 These drugs are readily available, inexpensive, easy to administer, and relatively nontoxic. 3 In cases in which the patient is febrile with the cause in doubt, before investigating the basic causes of the illness, therapy with an antibiotic should be attempted. In some instances a seriously ill patient is benefited by such a procedure, but in too many cases such an approach not only curtails the arrival at a correct diagnosis but may actually jeopardize the eventual recovery of a patient. A widespread epidemic of respiratory diseases, including influenza, occurred during the winter of 1952-1953. In this community many persons, with and without the

advice of physicians, took one or more antibiotics. In some instances suppurative complications may have been prevented by such medication, which was desirable in selected groups of patients. But in the majority of treated cases the clinical course was unaltered, a false sense of security dominated the patients — and physicians, the antibiotics induced troublesome, and even disabling, side-effects, occasionally, a more serious febrile disease than a mild respiratory disease was masked by such therapy.

It should be emphasized that most of the viral infections, many fungus diseases, and some bacterial infections are not benefited by antibiotic therapy. Whenever possible, and particularly in the seriously ill patient, every effort should be made to define the etiological agent responsible for an infection. The indiscriminate use of antibiotics in patients not only may destroy readily available bacteriological evidence as to the nature of the disease but may leave the attending physician with a patient who remains febrile and ill in spite of treatment with an antibiotic. This has occurred many times in instances of subacute bacterial endocarditis. In this disease, the micro-organism should be isolated and in vitro sensitivity test carried out, so that the proper antibiotic or combination of antibiotics can be selected and intensive treatment utilized for several weeks. Every staff in a large general hospital has encountered situations in which febrile patients with lymphoblastomas, blood dyscrasias, infectious mononucleosis, or malignant lesions have been uselessly treated with a variety of antibiotics before it was decided to seek out the fundamental causes for the illness.

One of the remarkable features of the antibiotics is that these agents exert their antibacterial effects by altering the metabolic activity of the bacterial cells but have little or no associated deleterious action on the cells of the host. Nevertheless, these drugs do cause side-effects, which may be more serious than the disease for which they are being prescribed. At least 1 to 2% of patients to whom penicillin is administered manifest hypersensitivity to the antibiotic. These reactions vary from a mild febrile response with or without a skin eruption to a violent systemic illness that simulates serum sickness. Rarely are these drug reactions irreversible and so progressively severe that death ensues. I have witnessed two, and possibly three, cases of fatal periarthritis nodosa where penicillin appeared to be the cause. Streptomycin also induces manifestations of hypersensitivity such as fever, skin rashes, and purpura. In addition, damage to the eighth nerve may occur owing to streptomycin, which provokes vestibular dysfunction, and dihydrostreptomycin may cause varying degrees of loss of hearing. These deleterious effects on the eighth nerve can be reduced by

Presented at the 10th Annual Medical and Surgical Symposium, Watts Hospital, Durham, N. C., Feb. 12, 1953.

combining equal parts of streptomycin and dihydrostreptomycin. In my experience, the so-called broad spectrum antibiotics, aureomycin and oxytetracycline (Terramycin), rarely cause hypersensitivity reactions in the form of fever and skin eruptions, but these agents may initiate disturbing side-effects referable to the gastrointestinal tract. Common manifestations are nausea, vomiting, abdominal distress, and, at times, diarrhea. The bacterial flora of the intestinal tract can be markedly altered by the ingestion of these agents, with the suppression, and even the elimination, of many species of bacteria. On the other hand, whereas the growth of some bacteria is suppressed, there are other species of microorganisms that reproduce more rapidly under these circumstances. The appearance of large numbers of fungi, like *Candida*, may result in inflammatory reactions involving the intestinal tract from the oral mucosa to the rectum. In a few instances, especially where the patient is poorly nourished, there may be a systemic invasion of the tissues by *Candida* fungus. At times profuse diarrhea may ensue, and some patients have exhibited the clinical features and lesions of acute ulcerative colitis. A severe form of diarrhea with dehydration and shock may be associated with the rapid multiplication of resistant staphylococci that produce an enterotoxin.¹ Examination of the stools will reveal an almost pure culture of *Micrococcus pyogenes*. Less violent effects on the gastrointestinal tract have been attributed to chloramphenicol, but this antibiotic may have a severe depressing effect on the bone marrow, resulting in an irreversible and fatal aplastic anemia. In regard to the gastrointestinal disturbances induced by the antibiotics, any of the antibiotics when administered orally may be potential offenders. Bacitracin, polymyxin, and neomycin are all nephrotoxic agents and should be used with extreme caution for systemic purposes. In addition, neomycin is ototoxic. Neomycin has been used extensively, without undesirable reactions, in the University of Minnesota clinics for the preoperative preparation of patients who undergo surgery on the gastrointestinal tract. Furthermore, neomycin has been employed in aerosol form by Waisbren and Hall² for bronchiectasis, chronic bronchitis, and lung abscess. No toxic reactions have followed the use of 0.5 gm in 3 ml of sodium chloride solution administered with a no. 40 DeVilbiss nebulizer twice daily. Aside from gastrointestinal disturbances, no serious reactions have thus far been attributed to erythromycin and carbomycin.

Reference has already been made to the emergence and proliferation of strains of bacteria highly resistant to the antibiotics as a result of the selective action of these agents. Some aspects of this problem will be developed in more detail shortly. Of major concern is the dissemination of strains of staphylococci that not only are resistant to penicillin, streptomycin, aureomycin, oxytetracycline, and chloramphenicol but are also beginning to manifest resistance to some of the newer antibiotics.

Another problem involves the resistance of many species of gram-negative bacteria to penicillin. The clinicians may properly start treating an infection due to a susceptible strain of gram-positive organisms and then, because of the overgrowth of a resistant strain or strains of gram-negative bacteria, end treating a new bacterial infection in the patient as a result of penicillin therapy. A similar sequence of events has occurred in cases in which streptomycin was used and an infection due to gram-positive organisms appeared later.³

CHOICE AND COMBINATIONS OF ANTIBIOTICS

Reflecting the competitive nature and resourcefulness of the pharmaceutical industry, hundreds of antibiotics have been investigated as potential therapeutic agents. Fortunately, relatively few of them have been placed at the disposal of the physician. Those organizations that have uncovered a new and acceptable antibiotic have exploited their good fortune by pinpointing the efforts of the whole sales force on their new agent, always fearful in the meantime that another more desirable antibiotic of their competitors will be marketed. Those companies that have not discovered their own antibiotic have often launched an altered form of an established antibiotic, such as penicillin, or a combination of antibiotics, and some have even found it profitable to place a revised form of a sulfonamide before the medical profession. It is little wonder that the bewildered physician, besieged by detail men, attractive literature, and the voluminous reports in the medical press, hardly knows which way to turn in the selection of the most effective antibiotic for his patient. The present purpose is not to review the choice of antibiotics for each of the infectious diseases but to emphasize the problem that exists in selecting the proper antibiotic and to discuss what the physician can do under the circumstances.

In comparison with the many antibiotics that are now available, penicillin is the most effective agent for many diseases, especially infections caused by gram-positive cocci, and it is the indicated drug for the treatment of gonorrhea and syphilis. But a most confusing aspect of penicillin therapy revolves about the question as to whether it is more advantageous to employ preparations of the antibiotic that are rapidly absorbed from the sites of administration or to use those forms that are slowly absorbed and in consequence remain in the blood for a longer period of time. It should be emphasized that the tremendous number of preparations of commercial penicillin now available have essentially the same antibacterial activity but differ primarily in their rates of absorption. The physician will make no mistake in treating those infections for which penicillin is indicated by using the inexpensive crystalline penicillin G dissolved in water, provided enough material is injected. Under no circumstances is it necessary to administer penicillin intramuscularly more frequently than every four to six hours. Infections due to those bacteria highly sensitive to penicillin, such as pneumococci and group A hemolytic streptococci, can be treated with injections given intramuscularly every 12 hours. Aqueous solutions of penicillin G in large doses are preferred for the therapy of subacute bacterial endocarditis and for staphylococcal sepsis. On the other hand, when penicillin is used for

prophylactic purposes, and in the treatment of those diseases in which a low concentration of penicillin is sufficient for the disposal of sensitive bacteria, there are advantages in using preparations of so-called depot penicillins. The physician need inject such a preparation only once every 24 hours, and, in some instances, every 48 to 72 hours. Crystalline penicillin G may be administered intermittently by the intravenous route, and under some circumstances this procedure has certain advantages, such as in the treatment of subacute bacterial endocarditis, lung abscess, and pneumococcal meningitis. The usual practice is to augment the standardized intramuscular doses with injections given intravenously.

Streptomycin and dihydrostreptomycin have essentially the same antibacterial activity. While either drug is effective in the treatment of tuberculosis, streptomycin is used more frequently than dihydrostreptomycin. Either drug is the agent of first choice for the therapy of tularemia. Streptomycin can be used in combination with other antibiotics and with the sulfonamides, as will be pointed out shortly.

In the practice of medicine it is often impossible to acquire precise laboratory information that will define the etiological agent responsible for an infection. Under these uncertain circumstances, the physician can turn to the broad spectrum antibiotics that affect gram-positive and gram-negative bacteria, as well as the rickettsiae, and even some of the larger viruses. These antibiotics have an added virtue in that they can be administered orally. With either aureomycin or oxytetracycline, many diseases can be adequately treated by prescribing a total daily dose of only 1 gm, 250 mg being given every six hours. Because chloramphenicol does cause aplastic anemia, I have reserved this drug for the treatment of typhoid and infections not favorably influenced by aureomycin or oxytetracycline. Except for local purposes, bacitracin has been cautiously used systemically only in those cases of staphylococcal sepsis where normal renal function is present. This also applies to polymyxin B, which is the drug of choice for serious infection due to *Pseudomonas aeruginosa* (pyocyanus). As already noted, neomycin is being used in these clinics orally, and preliminary observations indicate that a total daily dose of 750 mg may be administered parenterally without toxic manifestations. Erythromycin and carbomycin have a more restricted antibacterial activity than aureomycin or oxytetracycline, but these drugs have been found useful for infections due to gram-positive cocci.

An aspect of antibiotic therapy that has occasioned considerable misunderstanding relates to the simultaneous use of two or more antibiotics. It has been demonstrated in the laboratory that the killing effect of two antibiotics for bacteria may be less efficient than if the more active of the two drugs were selected and used alone. This is an expression of antagonism.⁴ There is no question that under certain restricted experimental conditions antibiotic antagonism may be exhibited, but in actual clinical practice it is highly doubtful that significant antagonism occurs. A possible exception to this conclusion relates to the simultaneous treatment of pneumococcal meningitis with penicillin and aureomycin.⁵ It would appear that better results could be obtained in the treatment of this disease when penicillin

was used alone. While the clinician, in the light of present knowledge, need not concern himself too much with the problem of antagonism of antibiotics in the human body, there are definite advantages in administering two antibiotics under certain conditions. There are two sensible indications for the utilization of combinations of antibiotics. First, clear-cut laboratory and clinical data are now available in which it has been demonstrated that two antibiotics will exhibit a synergistic effect against a given species of bacteria. This means that the killing action of the agents is greater than that obtained by adding together the independent effects of each antibiotic. This has been demonstrated in the treatment of subacute bacterial endocarditis with penicillin and streptomycin, in cases of staphylococcal sepsis in which penicillin and bacitracin have been used, and in some cases of brucellosis in which aureomycin has been administered along with streptomycin, however, such indisputable examples of synergism are the exception rather than the rule. Tuberculosis has been treated effectively with a combination of streptomycin and *p*-aminosalicylic acid or isoniazid, although the latter two drugs cannot properly be considered antibiotics. A second general indication for the use of combinations of antibiotics arises out of desperate clinical conditions in which an undefined mixed type of bacterial infection exists. These conditions include the rupture of a hollow viscus such as a perforated peptic ulcer, or the perforation of an appendix, where the bacterial flora of the intestinal tract may find its way into the peritoneal cavity. Under such circumstances I have not been sanguine enough to rely on a single suppressive agent like aureomycin or oxytetracycline but have administered penicillin and streptomycin empirically, and at times, along with aureomycin, in an attempt to keep the infection localized and the blood stream sterile. In an empirical fashion also, combinations of antibiotics have been tried in chronic infections of the urinary tract with variable results. It is apparent that present knowledge affords but limited indications for the use of combinations of antibiotics in the treatment of systemic infections. Optimum therapeutic results can be achieved in the majority of infectious processes by selecting the most active single antibiotic. The widespread practice of employing two, three, and even four antibiotics at the same time is inexcusable in most instances.

ANTIBIOTICS IN THE MANAGEMENT OF INFECTIONS OF THE URINARY TRACT

A perplexing therapeutic problem frequently confronting physicians concerns the use of the antibiotics in infections of the urinary tract. Although brilliant results often occur in the therapy of acute cases, the more chronic infections do not yield so readily. Because chronic disease is oftener associated with therapeutic failures, it is well to refer to the factors contributing to the deficiencies of the antibiotics under these conditions. As noted in the table, one of the commonest causes of

4 Jawetz, E. and Gunnison, J. B. An Experimental Basis of Combined Antibiotic Action. report of the Council on Pharmacy and Chemistry J. A. M. A. 150: 693 (Oct. 18) 1952.

failure, even though the proper antibiotic is selected, is obstruction along the urinary tract, which impedes the free flow of urine. Unless the obstructing process is removed, favorable results with antibiotics will not be achieved, and relapses will frequently occur. Unrecognized tuberculosis of the genitourinary tract will not respond satisfactorily. Not infrequently, more than one species of micro-organism has invaded the tissues, and the selected antibiotic may be inactive against one of them. Finally, micro-organisms resistant to the administered antibiotics may be the cause of chronic disease. The species of micro-organisms that oftenest cause infections of the urinary tract include the following: *Escherichia coli*, *Aerobacter aerogenes*, *Pseudomonas aeruginosa*, *Proteus vulgaris*, *Streptococcus faecalis*, *Micrococcus pyogenes*, *Klebsiella pneumoniae*, and *paracolon bacillus*. It will be noted that most of the species involve gram-negative organisms found in the feces. Except in cases of infections due to *M. pyogenes* and infections caused by *Str. faecalis*, it becomes obvious why penicillin is not the best agent for the treatment of urinary tract infections. In fact, better results are often achieved with

Factors Contributing to the Failure of Antibiotics and to Chronicity in Infections of the Urinary Tract

one of the sulfonamide preparations. In general, I have had the most favorable therapeutic results in infections due to coliform organisms when I used aureomycin. Experience with oxytetracycline has been limited. The two species of micro-organisms that are difficult to eradicate from the urinary tract are *Ps. aeruginosa* and *P. vulgaris*. The former species has been found to be highly resistant to most of the commonly used antibiotics. If normal renal function is present, polymyxin B may be tried in an effort to eliminate the organisms. Another possibility for *Pseudomonas* organisms involves the use of streptomycin along with sulfadiazine. Organisms belonging to the *Proteus* group have often been found sensitive in vitro to penicillin and chloramphenicol. Either or both of these drugs administered simultaneously have been successfully used in eliminating this species.

A disturbing feature of urinary tract infections is that the disease is not infrequently caused by more than one species of bacteria. Therapy may be aimed at one species with apparent success, only to have a relapse occur, but a second species of organisms may then be apparent in the cultures. For this reason, combinations of antibiotics may have to be employed.

BACTEREMIA DUE TO GRAM-NEGATIVE BACILLI

A problem closely related to urinary tract infections is the invasion of the blood stream by coliform organisms. This type of bacteremia is occurring with increasing frequency, judging by the number of cases clinicians are seeing, and this rising incidence may be due in part to the selective action of the antibiotics in which the growth of the more sensitive bacterial species is subdued, thus permitting the multiplication of the less sensitive gram-negative organisms.⁶ Walsbren⁷ was able to collect within one year 29 cases of bacteremia due to gram-negative bacilli other than *Salmonella* at the Minneapolis General Hospital. He called attention to two forms of clinical courses exhibited by patients having this type of bacteremia. The first group included patients who were febrile but alert. In such cases the pulse was bounding, but the blood pressure was normal. The second group demonstrated a picture of shock with high fever, but the skin was clammy, the pulse thready, and the blood pressure very low. These clinical manifestations were associated with bacteremia due to *Escherichia coli*, *Aerobacter aerogenes*, or *Proteus* organisms. He had one case of shock due to *paracolon bacilli*. Borden and Hall⁸ have also described this syndrome of shock and death as a result of bacteremia due to *paracolon* organisms. It is of interest that Walsbren did not uniformly observe shock in patients having a bacteremia due to *Pseudomonas aeruginosa*. The most frequent portal of entry in his cases was the genitourinary tract, and the commonest precipitating factors were catheterization and instrumentation of the urinary bladder.

The treatment of patients with bacteremia due to gram-negative bacilli poses several problems. Since most of the cases involve patients of advanced age, prompt supportive measures should be instituted along with antibiotic therapy. In initiating treatment, I select a broad spectrum antibiotic, such as aureomycin, and administer the drug in an intravenous infusion. From 250 to 500 mg. of aureomycin is given in 200 ml. of sodium chloride solution every 8 to 12 hours. In the meantime, cultures of blood are kept under observation and sensitivity tests with the various antibiotics are undertaken as soon as isolations have been made. If the patient is in a state of shock, immediate efforts should be made to elevate the blood pressure, which can be done with *l*-arterenol.⁹ The failure of a patient to respond satisfactorily several hours after the first dose of aureomycin may suggest the presence of a bacteremia due to *Proteus* organisms, and large doses of penicillin along with chloramphenicol should be administered. In desperate cases, penicillin, aureomycin, and chloramphenicol have been used until the causative organism has been identified.

The seriousness of this form of bacteremia may be judged from the experience at the University of Minne-

sota Hospitals From March, 1951, to July, 1952, observations were made on 53 patients from whose blood gram-negative bacilli were isolated. Eight of these patients exhibited shock, the bacteremia being due to *Aerogenes* in three, *Esch coli* in two, paracolon bacilli in one, and *Salmonella typhimurium* in one. Although these patients received *I*-arterenol and antibiotics, six of the eight died.

STAPHYLOCOCCIC SEPSIS

When penicillin was first introduced for clinical trials, it was soon established that this agent would resolve many therapeutic problems relating to the management of staphylococcic sepsis. A decade has now elapsed in which penicillin and other antibiotics have been thoroughly evaluated in patients with staphylococcic infections. An initial feeling of optimism over what had been accomplished has been succeeded by waves of increasing pessimism. Early investigations indicated that the vast majority of strains of staphylococci isolated from human sources were sensitive to penicillin. This *in vitro* sensitivity was reflected in excellent therapeutic results with the drug in patients. But with the passage of time, more and more patients were encountered who were suffering from staphylococcic infections in which the offending organism was highly resistant to penicillin. In various parts of the world, there was every indication that the widespread use of penicillin had resulted in the appearance of highly resistant strains of staphylococci. This state of affairs has been demonstrated in this clinic at present, where over 50% of the strains of staphylococci isolated from human sources are highly resistant to penicillin. In other words, if penicillin were to be used in patients with staphylococcic sepsis, there would be less than a 50-50 chance of the drug being effective. When other antibiotics became available for staphylococcic diseases, the story of penicillin resistance was repeated. Strains highly resistant to streptomycin soon appeared with the increasing frequency. Resistance to aureomycin and oxytetracycline is now such a common phenomenon that approximately 40% of the strains isolated at the University Hospitals are resistant to these agents. The introduction of erythromycin appeared to resolve the problem of antibiotic resistance temporarily, but recent evidence indicates that erythromycin-resistant strains of staphylococci have appeared as a result of therapy with that agent.¹⁰ The seriousness of the problem of staphylococcic sepsis was emphasized for the staff during the last week in 1952, when seven patients with staphylococcic septicemia were encountered on the teaching services of two hospitals, and four of these patients had acute staphylococcic endocarditis.

While there is no entirely satisfactory answer, at present, to the therapy of patients with staphylococcic infections, much can be accomplished with the antibiotics when the clinician is guided by *in vitro* sensitivity studies. The strain of *Staphylococcus* responsible for the infection should be isolated as soon as possible and subjected to the *in vitro* action of the different antibiotics. When the organisms are sensitive, penicillin is still the antibiotic of choice in the treatment of staphylococcic infections. If the serious nature of acute staphylococcic endocarditis is considered, it is remarkable that approximately half

of the patients have been reported as recovering following the use of penicillin.¹¹ Even in the case of penicillin sensitive staphylococci, large doses of the antibiotic should be used, and treatment continued for many days, and even weeks, after apparent recovery. A frequent mistake is to discontinue therapy too soon. Crystalline penicillin G in water can be administered intramuscularly every four to six hours in a dose of 500,000 units. In addition, "booster doses" should be administered intravenously in doses of 1 million units in 10 ml of sodium chloride solution every 12 hours. These latter doses should be continued until the disease is well under control, and then the dose of penicillin should be gradually reduced. In the cases of severe staphylococcic sepsis with bacteremia, and particularly in those patients having endocarditis, bacitracin has been given simultaneously with penicillin, providing the strain was sensitive to bacitracin and normal renal function was present. Since bacitracin is nephrotoxic, minimal doses have been used in the range of 20,000 units administered intramuscularly every six hours. The combination of bacitracin and penicillin need only be used in the initial week or two, after which the bacitracin should be discontinued. If the strain of *Staphylococcus* proves to be highly resistant to penicillin, it is necessary to turn to other antibiotics. Some patients have responded satisfactorily to either aureomycin or oxytetracycline, where the organisms have been sensitive to these drugs. I have used aureomycin intravenously in a dose of 300 to 500 mg given intravenously in 200 ml of sodium chloride solution every 8 to 12 hours. If improvement occurs, the drug is then administered orally alone in a dose of 0.5 gm every six hours. I do not encourage the use of aureomycin or oxytetracycline along with penicillin. More recently, erythromycin has been employed in the clinic for the treatment of infections due to penicillin-resistant staphylococci, and, while the early results have been encouraging, I anticipate the emergence of erythromycin-resistant strains. The drug has been administered orally in a dose of 200 to 300 mg every six hours. A combination that has been tried recently in two patients with favorable results suggests that further trials should be made and involves the use of 20,000 units of bacitracin given intramuscularly every six hours and 300 mg of erythromycin administered orally every six hours. In severe cases of sepsis, this combination has been given for two to three weeks, and then erythromycin continued alone for another week or two. Preliminary investigations with carbomycin indicate that it is also of value in the treatment of staphylococcic infections, and should be administered in a similar manner.

COMMENT AND CONCLUSIONS

The rapid and extraordinary achievements in the treatment of infectious diseases constitute one of the outstanding advancements of modern medicine. This field of inquiry is not static, and investigations are continuing in the search for agents that will yield optimum results with the least harmful effects for the patients, and for

10 Haight T H and Finland M. Resistance of Bacteria to Erythromycin. *Proc Soc Exper Biol & Med* 81: 183, 1952.

11 Dowling H F, Lepper M H, Caldwell E R and Spies H W. Staphylococcic Endocarditis. An Analysis of 25 Cases Treated with Antibiotics. Together with a Review of the Recent Literature. *Medicine* 31: 155, 1952.

successful therapy of diseases due to viruses and fungi. It is difficult for the busy practitioner and for a hospital staff to keep up with the more recent developments. In order to crystallize the available information for practical purposes, it is suggested that each hospital staff, and especially the larger general hospitals, have a standing committee on chemotherapy, for the purpose of evaluating and recommending standard procedures for the use of the antibiotics. The various services and specialties should be represented, including the hospital pharmacy. In the teaching centers, a member of the department of

pharmacology would be a valuable addition. Such a committee could periodically survey the recent developments, take inventory of problems that have arisen in their own hospital, and indicate the drugs, schedules of doses, and methods of administration for the various clinical conditions. With the increasing cost of medical care, the committee could also aid the pharmacist and the purchasing department in selecting those therapeutic agents that are less expensive and at the same time just as effective as the more costly antibiotic preparations.

CRANIOCEREBRAL INJURIES

William R. Lipscomb, M.D., Denver

This era of mechanization, with emphasis on high speed transportation, has increased the incidence of injuries to the head and all other human tissues. Therefore, in addition to a neurological examination, a careful, complete, general examination is imperative before the proper course of any treatment can be planned and instituted. All injuries must be treated in order of importance before definitive treatment of the craniocerebral injury is embarked on. Active hemorrhages must be arrested, shock eliminated, and obstructed respiratory pathways cleared. If simple oropharyngeal suction is inadequate, a tracheotomy will be necessary. The different pathological lesions resulting from craniocerebral injuries and their respective treatment can be conveniently discussed by consideration successively of the tissues from the scalp to the ventricles.

INJURIES TO THE SCALP

Traumatic lesions of the scalp may be minor, and the contusions and abrasions may require nothing more than thorough, gentle lavage with soap and water and application of nonadhering dressing of penicillin ointment or the like. Major scalp lacerations or avulsions usually require débridement, hemostasis, suturing, or some plastic procedures. To cover a small scalp loss resulting from an avulsion, the surgeon, after properly shaving, cleansing, and débriding, may simply undermine subgaleally the surrounding scalp in a radial fashion until the scalp will stretch without much tension, cover the scalp defect, and allow wound edges to be approximated with sutures.

Sometimes a large area of scalp is lost and one or two pedicle scalp flaps may have to be mobilized and swung into position to cover the denuded area. In so doing the surgeon must remember the blood supply and locate the flap's pedicle so that the arterial blood supply to the flap is maintained. If the bone is bared of pericranium, the swinging of pedicle flaps should be delayed until there is present a bed of granulation tissue with good, active circulation. Such a bed of granulation tissue can be encouraged to grow if multiple drill perforations are made through the outer table of the skull. When the granulations springing from the perforations in the outer

table become confluent, a full thickness pedicle scalp flap or small free partial thickness skin grafts or a combination of both may be swung or laid in place.

BONE AND DURA INJURIES

A skull fracture should in part indicate the amplitude of the forces that acted to cause the head injury. The fracture per se is not necessarily serious unless there is a depression of the skull over an essential area of cortex like the motor convolution or visual area, or the depression causes impingement on a cranial nerve as it makes its exit through a skull foramen. Skull depressions and foraminal impingement should be removed as soon as practical. Delay may cause irreversible changes and permanent disability. When the depressed bone fragments have been removed, an intradural inspection of the brain should be made. If hemorrhagic, necrotic brain tissue is present, that should be removed and the dura closed. In closed, clean wounds in children, some bone fragments should be placed in the area of decompression where they will act as osteogenic foci and promote skull reformation, which is sometimes complete and cosmetically satisfactory. Similarly treated small skull defects in adults may become solid enough to prevent pulsations and also produce a satisfactory psychological and cosmetic result. In cases with compounded skull fractures, the surgeon risks promoting infection if he replaces the bone fragments, even with liberal use of chemotherapeutic and antibiotic agents. It is safer to use tantalum or other materials for cranioplasty months after the healing of compound skull fractures.

A fracture in the region of the paranasal sinuses or thru the petrous pyramid may be associated with a tear in the dura and arachnoid, thus allowing cerebral spinal fluid to escape into the nasal cavity or auditory canals. Through such fractures and dural tears micro-organisms may enter the cranial cavity, causing meningitis and brain abscesses. Since meningeal tears over the paranasal sinuses are potentially serious, they should be "patched" intracranially as soon as the patient's condition permits. Through a transfrontal craniotomy the dural tear can be exposed and easily covered with a piece of epicranium, which can be obtained from along side the operative scalp incision. Fascia lata from the thigh is thicker, stiffer, and more difficult to bring into water-tight juxtaposition.

position over the irregular surface of the base of the anterior fossa than is the thin, more flexible pericranium. Scarifying the dura on which the patch is to be laid promotes adherence and revitalization of a free graft.

Dural tears over the petrous pyramid with cerebrospinal fluid leakage into the external or internal auditory meatus usually can be treated satisfactorily without surgery by having the patient lie on the affected side with the head elevated. In such a position the brain acts as a tampon and soon fibrous tissue closes the dura tear. All attendants should be warned to keep applicators and other cleansing devices out of the draining ear, and a dressing fixed over the ear with adhesive tape and marked "keep out" will be helpful in this respect. Patients with cerebral spinal fluid otorrhea or rhinorrhea should be given therapeutic doses of sulfadiazine and sulfamerazine because these sulfonamide compounds are secreted into spinal fluid in concentrations approximately one-half those in blood. For adults, a dose of 1 gm of mixture should be given every three to six hours with a similar amount of sodium bicarbonate, starting immediately after the accident. Fluids should be administered in amounts short of promoting cerebral edema yet causing excretion of 1,200 to 1,500 cc of urine every 24 hours, a quantity that will usually prevent sulfonamide crystalluria or anuria. In addition to the sulfonamide drugs, aureomycin, 250 to 500 mg every three to four hours, should be given because this particular antibiotic is also secreted into cerebral spinal fluid.

BRAIN, DURA, AND DURAL BLOOD VESSELS

When the dura is lacerated by a depressed fragment of skull, the underlying brain and its blood vessels are usually lacerated, too. By suction the hemorrhagic, devitalized brain tissue should be carefully removed and all bleeding controlled. If there has been a loss of dura, a free pericranial graft is taken and sutured in place, and if there has been only a dural laceration over the convexity of the brain, dural suturing will suffice. The other layers of tissues in the wound then can be treated appropriately.

Occasionally the dura subjacent to a fracture will not be lacerated but one of the dural arteries will be lacerated and an extradural hematoma forms. In such cases the patient usually suffers a head injury severe enough to become unconscious for a short period. When the patient recovers consciousness, he complains of headache and he has nausea and vomits. Usually within a matter of a few hours his condition deteriorates and he becomes progressively more lethargic, stuporous, and finally comatose. He may have a dilated pupil on the side of the extradural clot and often he will have a contralateral spastic weakness of extremities and increased tendon reflexes along with stiffness of the neck. The systolic blood pressure usually increases and the pulse and respiratory rates decrease. The lumbar spinal fluid is usually clear but the pressure is markedly elevated. Such a sequence of symptoms and signs should arouse the physician to make the diagnosis of supratentorial extradural hematoma and excite him immediately to have the clot removed surgically and to have the bleeding controlled.

Recently Schneider and Kahn¹ have emphasized the entity of extradural, infratentorial hematomas, which are easily overlooked because of low incidence of 0.5% of all extradural hemorrhages. A history of an injury to the occipital area with a fracture in this area and clinical signs referable to the neurological structures of that location, i.e., nystagmus, hyporeflexia, ataxia, and cerebellar fits, with cranial nerve dysfunction are reasons for considering the possibility of extradural infratentorial hematoma. Clear spinal fluid under increased pressure and progressively deepening stupor makes the diagnosis more certain. The treatment is like that of supratentorial extradural hematoma, namely, the surgical removal of the clot and arrest of hemorrhage. Since an associated supratentorial hematoma may be present, a trephine exploration should also be made superior to the lateral sinus and any hematoma there also removed.

CEREBRAL VEINS

Some patients, who are usually past 50 years of age, have head injuries and apparently suffer only a cerebral concussion or mild contusion with a short period of unconsciousness or have no period of unconsciousness but do have headache with or without nausea, dizziness, and other nervous symptoms for a short period. To all appearances, the patients recover and return to work but in a few weeks or even in three or more months they have a recurrence of headache, loss of interest in work and in their own personal appearance, clouding of sensorium, increasing somnolence, and occasionally urinary incontinence. These patients often have dilation of one pupil and maybe some other cerebral localizing signs. More frequently than not, they have xanthochromic spinal fluid with increased pressure and increased total protein. Usually x-ray examination of the skull reveals no skull fractures but the pineal body, if calcified, may be seen to be displaced from the normal midline position. Patients with such a sequence of symptoms and signs following head injury, regardless of how trivial, should have bilateral trephine explorations of the skull for subdural hematomas. Since about 50% of these subdural hematomas are bilateral, they should always be trephined bilaterally. Although skulls can be trephined any place, the optimum locations for the trephinations are in the coronal suture about 5 cm on each side of the sagittal suture. Another trephination in the temporal area on the involved side or sides makes for easy drainage. With a no. 14 or 16 French urethral catheter, all subdural adhesions can and should be broken to evacuate all loculations of blood. Drains should be left in the subdural space or spaces where hematomas have been evacuated. Rarely in an adult will the surgeon have to turn an osteoplastic flap to remove the hematoma. In infants, however, it is essential to turn a large flap and remove the neomembrane in order to prevent re-formation of hematoma or hygroma. If the trephination is done under local anesthetic on a stuporous patient, the patient may arouse during closure of the wounds and ask relevant questions. An interesting example was a stuporous obstetrician and gynecologist suffering from a large

1 Schneider R C, Kahn E A and Crosby E C Extradural Hematoma of Posterior Fossa Neurology 1:386 1951

subdural hematoma who aroused after drainage of the hematoma, and during closure of wounds called out from under the operative drape, "Use some K-Y [a lubricating jelly] on those needles"

Trauma is no doubt the greatest factor in production of subdural hematoma, even though some patients having subdural hematoma do not preoperatively recall having had head injuries. Postoperatively, when the sensorium has cleared, some of these patients will recall pertinent injuries such as arising under an open cupboard door and striking the head and having inconsequential headache of short duration. The injury was thought trivial and forgotten. Because the bleeding is venous in origin, only a small clot forms to produce the first symptoms. After passage of weeks or months the subdural hematoma becomes quite large and produces symptoms and signs indicating the gravity of the patient's condition. Subdural hematomas are common in alcoholic patients who have high thresholds to pain and high indexes of forgetfulness and euphoria. Bleeding intracranial aneurysms may be associated with a complicating subdural hematoma without associated head injury.

CEREBRUM AND VENTRICLES

Rarely there may occur an intracerebral hematoma or an intraventricular hematoma that results from tearing of the intracerebral and intraventricular vessels. When these occur, they are like subdural hematomas in that they produce symptoms and signs only after a latent period. They are usually misdiagnosed as brain tumors and are treated surgically. Postoperatively in retrospect these patients may recall a head injury. Contusions to the cerebrum are common traumatic lesions but only rarely are subtemporal decompressions necessary to save a life.

GENERAL PRINCIPLES IN TREATMENT OF HEAD INJURIES

A patient who receives a head injury may at the time of first examination have no signs of intracranial hematoma formation or intracranial pressure, so it is imperative that frequent neurological examinations be made and that the vital statistics be recorded graphically at frequent intervals, for example, every one-quarter hour until the patient reacts, then every hour until stabilized, and finally every three hours until it is safe to discontinue. A record of mental status should also be made every one-quarter hour until the patient reacts and then every hour or so, as the condition requires. For temperatures of 102 F rectally or above from 10 to 15 grains (0.6 to 1 gm) of acetylsalicylic acid should be given orally or per gavage every three to six hours. A minimum of bed covering or clothing is advisable. For higher temperatures the nurses should sponge the patient with a cool, moist cloth or cover with cold towels. An electric fan directed not at the patient but close to the patient should be helpful in decreasing the temperature.

Oxygen Administration and Position — All patients with serious head injuries who are unconscious should receive moistened oxygen administered through a soft nasal catheter at 3 to 5 liters per minute. The head of the bed should be elevated 45 degrees when the patient's cough and gag reflexes return and when the blood pressure, pulse, and respiration rate permit. The patient should be turned every one to three hours. When the bed

is level, nurses may turn the patient on the abdomen if there are no contraindications.

Pain — For pain and restlessness $\frac{1}{2}$ to 1 grain (30 to 60 mg) of codeine can be given hypodermically as necessary every two to four hours, or acetylsalicylic acid with or without $\frac{1}{4}$ to $\frac{1}{2}$ grain of codeine orally. If the patient is irrational and pain is not controlled with codeine, 2 to 4 drachms (8 to 15 cc) of paraldehyde in iced orange juice or other agent can be given orally or rectally, mixed with an equal amount of mineral or vegetable oil, every three hours as necessary. Morphine, which depresses respiration, as does intracranial pressure, should be avoided. Barbiturates should not be used, because they normally make the patient lethargic, as does increasing intracranial pressure. By avoiding these drugs, the observer gets a true clinical picture of the patient's condition without having to discount the influence of the drugs.

Bacteriostatic Agents — Antibiotics should be used prophylactically as indicated. Aureomycin is excreted into the cerebrospinal fluid and affects many gram-positive and gram-negative species of micro-organisms. If patients can not take aureomycin, another suitable antibiotic should be given. In cases in which meningitis complicates the injury, cultures should be made from spinal fluid and sensitivity tests made, and only those antibiotics should be used to which the organisms are most sensitive.

The sulfonamide drugs administered together are synergists. In central nervous system infections, a most effective combination is that of sulfadiazine and sulfamerazine, which are secreted into the cerebrospinal fluid in about one-half of their blood concentration. If the bacteria are not sensitive to sulfadiazine or sulfamerazine, however, they should not be used because of the risk of kidney complications. The optimum dose for adults is 1 gm (0.5 gm each) of sulfadiazine and sulfamerazine given with 1 to 2 gm of sodium bicarbonate every three to eight hours, depending on the size of the patient and the severity of the infection.

Fluids — Fluid intake should be limited to 1,500 cc for the first 24 hours or maybe longer, unless the temperature is 102 F or above or unless sulfonamides are used and then the intake should be increased as indicated in order to obtain a urinary output of 1,500 cc per 24 hours. Fluids may be given by vein, but, if the patient is unconscious, the fluid and diet, as a formula, may be given by gavage tube. In cases in which intracranial pressure is increased owing to cerebral edema associated with cerebral contusion, it is important to limit fluid intake and not give the sodium ion, to dehydrate by giving a saline cathartic (such as magnesium sulfate, sodium phosphate, or citrate of magnesia) every morning, to do spinal punctures, and to reduce pressure by one-half of the increased pressure (by one-half what the pressure is over the normal of 15 cm of water pressure).

Administration of hypertonic intravenous solutions probably is indicated in only a few cases of cerebral edema. The most valuable hypertonic solution is human serum albumin, which should be given in 60 to 80 cc amounts in not less than 10 minute periods, every 8 to 10 hours. It should be repeated as often as indicated. Lastly, in addition to the foregoing measures to reduce cerebral edema causing increased intracranial pressure,

extensive bilateral subtemporal decompressions may be in order, with removal of as much fluid from the subarachnoidal and subdural space as possible

Food—If the patient is conscious, he should be given a liquid to regular diet as tolerated. If he is unconscious, he should be given by gavage a formula, made up to 1,500 cc containing 1,500 calories, composed of whole milk, whole eggs, and molasses, 375 cc are given every six hours. The volume, the caloric content, and the frequency of administration may be varied to suit individual cases, and some all-inclusive vitamin preparation should be added. Medicaments for oral administration may be given in solution or be crushed and put into solution to be given through the gavage tube.

Antiserums and Antitoxin—Polyvalent antiserums should be given in all cases of contaminated wounds of the head, and tetanus antitoxin in cases of perforating or puncture wounds if the patient has not been protected with toxoid. If the patient has previously had toxoid, a booster dose may be all that is indicated.

Ambulation—Patients suffering from cerebral concussions should be ambulated as soon as they recover consciousness and stability. Those with severer injuries such as cerebral contusions with and without subarachnoid hemorrhages should be allowed to sit on the edge of the bed and dangle their feet about 24 hours after active hemorrhage has ceased. The amount of blood found in successive lumbar spinal taps should reveal when the active hemorrhage stopped. The initial activity should not be strenuous but should be limited to a few minutes of walking to the bathroom or the like. Subsequently the patient should rest and later be ambulated until he is able to remain out of bed and be active all the time. It is extremely important to examine the patient repeatedly for signs indicative of cerebral localization or increasing intracranial pressure, both of which might indicate hematoma formation. When the patient has recovered sufficiently, he should return to his job, at first maybe only for part time, but nonetheless working and making a part of his living. Patients with cerebral lacerations that required débridement may not be rehabilitated so rapidly, however, as soon as possible they should be allowed to dangle their legs, to get into a chair, to walk, and to work, and should be encouraged to engage in normal activities as much as possible.

Spinal Fluid Examinations—Not all patients suffering from head injuries need spinal fluid examinations. Lumbar puncture with pressure determination is indicated when the patients' vital signs and mental status suggest increasing intracranial pressure, which is usually manifested by progressively rising blood pressure, and by progressively slowing pulse and respirations. Such a patient usually becomes progressively more drowsy and finally stuporous and comatose, however, when the pulse is very rapid, respirations are very fast and shallow, and the blood pressure is low, such radical changes in vital signs are usually signs of a very serious circulatory and respiratory collapse and impending death. If in addition to changes of vital signs, there are cerebral localizing signs and the spinal fluid is clear and under increased pressure, it is almost certain to mean the patient has an extradural hematoma and needs immediate surgery. On

the other hand, if the patient has bloody spinal fluid under increased pressure, the examiner must be able to evaluate whether or not this is only a cerebral contusion with cerebral edema and whether or not surgical decompression is required. Patients with traumatic subarachnoidal hemorrhage usually have restlessness, headache, nausea and vomiting, photophobia, and a stiff neck but no cerebral localizing signs and no alteration in vital statistics. The spinal fluid in addition to being bloody will usually be under increased pressure. Daily or semidaily lumbar spinal drainage may be indicated to reduce the pressure by one-half of the increased pressure and to remove fluid until it is no longer bloody.

All elderly and some younger persons who have suffered cerebral contusions or worse lesions should be benefited by administration of $3\frac{3}{4}$ grains (250 mg) of caffeine sodium benzoate hypodermically every three hours from 6 a m to 9 p m. This drug seems to make the patients more responsive, alert, and active, and helps to clear their sensoriums so they can be discharged from the hospital and returned to daily routine more quickly.

Not infrequently a patient comes to the physician saying that he had a head injury a matter of days, weeks, or even months before and that he is "worried no end" because he has had a headache more or less ever since, and the headache is getting increasingly worse and interfering with his job and at times even preventing his sleep. The headache is worse if he is tired or nervous and if he works in the hot sun. In addition he complains of nervousness, easy fatigability, and forgetfulness. Those who associate with him complain of his irritability, and intolerance to noise and to children's play. Complete neurological examination, x-ray examination of the skull, electroencephalography, spinal fluid studies, and even air studies usually reveal no space-occupying lesion or other demonstrable organic brain disease. Repeated examinations, reassurance, encouragement from the physician, and the patient's own perseverance in an interesting job will divert his thoughts of his own condition and eventually bring about relief of symptoms. Such a syndrome is commonly called a post-traumatic syndrome. It is my personal experience to have patients with arterial hypertension frequently develop the so-called post traumatic syndrome, perhaps because they are basically inclined to worry or to work very hard.

SUMMARY

Head injuries are discussed in a general way, with emphasis placed on lesions that require surgical intervention. The general principles of treatment are discussed in detail.

1809 E 18th Ave

Weight Reduction and Atherosclerosis—The relationship between obesity and atherosclerosis has been studied in a large clinical experiment. Significant weight reductions in 39 patients revealed that the serum lipoproteins are significantly reduced by this procedure in those patients with initially high levels, but are not significantly altered in patients with initially low levels. The cholesterol levels are unchanged. If the hypothesis relating high serum levels of lipoproteins to the development of atherosclerosis can be confirmed, then this experiment will supply evidence indicating the beneficial effect of weight reduction.—F J Stare, M.D., Nutritional Research in Public Health, *Postgraduate Medicine*, April, 1953.

CHANGE IN ELECTROLYTES IN A CASE OF PARATHION POISONING

Jere W Annis, M D

and

John W Williams, M D , Lakeland, Fla

Our purpose in reporting this case of parathion poisoning is to make known (a) the observed changes in the serum pH and calcium, phosphorus, and potassium levels and (b) the hitherto unreported residual manifestations affecting the central nervous system resulting from anoxia, prolonged unconsciousness, convulsive seizures, electrolytic and pH shifts, and/or severe cholinesterase depression. These latter may serve as a warning of the potential toxic effects of the chemical in nonfatal cases. The former, it is to be hoped, will stimulate follow-up studies in order to determine whether the changes in pH and electrolyte concentration are as determinant of the variations in symptoms, the severity of poisoning, and the prognosis as are the changes in the cholinesterase levels of the plasma and cells.

REPORT OF A CASE

A 19 year old man had worked in close contact with parathion for a total of 69 hours before onset of illness (table 1). This man mixed materials in a spray tank and then delivered them to a speed sprayer. He never went inside the tank. He was equipped at the beginning of each day's work with clean coveralls, natural rubber gloves and hat, and a respirator. He took a shower at the end of each day's work before leaving the premises. Each day, he washed his hands and face before eating the noon meal. He was instructed to wash his hands and face at each of the two break periods during the day. He had never worked with parathion prior to this time. A cholinesterase determination,¹ done four days before his admission to the hospital, showed a level of 144% in the red blood cells and 82% in the plasma. He felt well on the morning of July 20, 1952, and, on reporting to work, he changed into clean protective coveralls, rubber gloves, and a mask. He worked mixing parathion throughout the morning as usual and noticed no ill effects. The weather was excessively warm and there was little breeze. He ate well at noon but shortly thereafter began to feel ill and told his co worker that he was dizzy. The superintendent was called immediately. He found the patient somewhat stuporous, perspiring freely, and complaining of nausea, vertigo, diminution of vision, and headache. The patient vomited shortly thereafter and was brought to the hospital emergency room at 4 p m the same afternoon. At that time he was unable to stand, was extremely groggy, and became comatose. His color was ashen gray, and respirations were labored. He appeared to be in rather profound shock, but his blood pressure was 154/84 mm Hg, his pulse 180, bounding and regular. His rectal temperature was 102 F. It was thought that he was gravely ill, and artificial respiration was begun immediately. The pupils were fixed and pinpoint, and there was marked conjunctivitis. There was copious sero-sanguinous, frothy exudate coming from the mouth and nose, and the neck veins were markedly distended. The heart sounds were normal except for a tachycardia. Moist rales were heard in the lung fields. The abdomen was normal, and the extremities showed marked decrease in only the deep tendon reflexes bilaterally. Babinski's sign was not elicited.

Voluntary respiration had ceased on admission, and the patient did not respond to painful stimuli. He underwent repeated intermittent generalized tonic and clonic convulsions of approximately two minutes duration. Oxygen was first ad-

ministered by mask and then continued by intratracheal tube so that the anesthetist might maintain forced respiration. In spite of therapy, voluntary respirations were not resumed until 10 30 p m. At that time, breathing became Cheyne-Stokes in character and, later, changed to typical Kussmaul's respirations. Normal respirations became established on the morning of July 21.

The patient was given 0.04 grain (0.002 gm) of atropine subcutaneously and 5 cc of nikethamide (Coramine) intravenously on admission. Intravenous administration of a solution of 5% glucose in saline was also started. During the first eight hours of hospitalization, the patient received 0.18 grain (0.011 gm) of atropine, of which 0.02 grain (0.001 gm) was given intravenously, 20 cc of nikethamide, 500 cc of citrated blood, and 2,000 cc of 5% glucose in isotonic sodium chloride solution, and 1,000 cc of 1/2 molar sodium lactate solution intravenously. Oxygen was administered by the anesthetist during this time, and 10 grains (0.65 gm) of phenobarbital sodium was given intramuscularly, plus 200 mg of secobarbital (Seconal) sodium intravenously in an effort to control the convulsions that occurred periodically throughout this period. It was soon noticed that the cannister on the anesthetic machine became too hot to touch. When the cannister was replaced, the same situation developed within 20 to 30 minutes. From this, it was assumed that the excessive activity of the soda lime must reflect a marked acidity in the expired air. Therefore serum pH and other blood chemistry values were determined, the serum pH at this time was 6.76 (table 2).

On the morning of the second hospital day, respirations were normal, but the intratracheal tube was left in place and administration of oxygen was continued. The patient was still unconscious. His rectal temperature varied from 102 to 103.6 F but tended to fall during the day. The pulse rate slowed to between 100 and 110 and became less bounding. During the preceding evening, the patient had vomited several times, and an intranasal tube was inserted for gastric lavage and drainage. This tube was left in place. The secretions from the respiratory tract decreased after atropine was given but were not well controlled for a period of at least 24 hours. An electrocardiogram showed no marked changes characteristic of potassium poisoning, although the serum potassium level was elevated. Because of his convulsive seizures, the needle came out of the patient's vein on numerous occasions, it was finally replaced by a polyethylene tube to prevent further extravasation of blood and other fluids into the subcutaneous tissues. During the 24 hours of the second day, the patient received 0.12 grains (0.007 gm) of atropine subcutaneously, 100 cc of whole blood, 4,000 cc of additional fluids, and 925 mg of secobarbital sodium administered intravenously to control convulsions.

Starting shortly after admission, a combination of penicillin and dihydrostreptomycin was given twice daily in an effort to prevent severe respiratory infection. Blood chemistry studies were repeated on the morning of the second day (table 2). The serum pH and the calcium-phosphorus ratio had returned to normal. A complete blood cell count made on admission was not remarkable except for a leukocyte count of 28,150. The urine showed albumin, 2+, and sugar, 4+, but this specimen was obtained after one liter of glucose had been given intravenously. Inadvertently, the vomitus, urine, and the excretions from the respiratory tract were discarded on the initial day. After that examination of these wastes showed no parathion, cholinesterase activity, or cholinesterase inhibitor effect. No information was obtained by analysis of the soda lime except that it had been neutralized by a considerable amount of acid.

On the morning of the third day, the pupils, which had hitherto been extremely small, began to dilate for short periods of time after atropine was given, and the cholinesterase levels began to rise satisfactorily in both blood and plasma. In the

1 Michel H O. An Electrometric Method for Determination of Red Blood Cell and Plasma Cholinesterase Activity. *J Lab & Clin Med* 34: 1564 1949

course of that day, the patient had many convulsions, the duration of these convulsions increased over that of the earlier ones, which had lasted two minutes. In this 24 hour period, he received a total of 700 mg of secobarbital sodium intravenously, 0.06 grain (0.004 gm) of atropine, 500 cc of whole blood, and 2,000 cc of $\frac{1}{2}$ molar sodium lactate. His rectal temperature reached a peak of 102 F, and he seemed generally improved.

On July 23, the convulsions ceased, but the temperature rose to 104.4 F. There were numerous liquid, involuntary stools. The urinary output by continuous catheter drainage remained

conscious for 84 hours. His temperature during this day rose twice to peaks of 104 F. His pulse rate remained about 100. He cooperated to the extent of expectorating mucus and swallowing with some difficulty. He asked for fluids. He had no convulsions during this day, and his pupils remained well dilated. He received no more atropine. In the course of the day, he received 500 cc of blood and 3,000 cc of other fluid via the polyethylene tube. He received 1,000 mg of oxytetracycline (Terramycin) intravenously, and administration of penicillin was continued. The cholinesterase levels had risen to 88% in the red blood cells and 61% in the plasma by 4

TABLE 1—Summary of Patient's Work with Parathion

Day July 19-20	Hours Worked Directly with Parathion	Hours Worked In Coveralls Contaminated by Parathion	Material Handled Lb			
			Borax	Wettable Sulfur	Parathion Powder (16% Wettable)	Arsenate of Lead
10	10		120	1,200	400	
11	12		60	600	200	64
			100	1,000	350

* All cholinesterase determinations were calculated according to the method described by Michel.¹

satisfactory. In the 24 hours of July 23, he received 20 grains (1.29 gm) of phenobarbital sodium intramuscularly, 500 cc of whole blood, and 2,000 cc of 5% glucose in sodium chloride solution. He received only 0.04 grain (0.003 gm) of atropine, and his pupils now were normal in size.

Total medication in this first 80 hours of hospitalization, was two-fifths or 0.4 grain (0.024 gm) of atropine, 2,325 mg of secobarbital sodium, 25 cc of nikethamide, 30 grains (2 gm) of phenobarbital sodium, 2,500 cc of whole blood, and 12,000 cc of other fluids administered intravenously. The patient still had not regained consciousness. There was considerable subcutaneous swelling in both arms especially at the site of extravasation of fluids from the first days' intravenous injections in the right arm.

At 4 a.m. July 24, the fourth hospital day, the patient regained consciousness for the first time. He had been un-

p.m. on July 24. The swelling in both arms had decreased somewhat.

On the morning of July 25, the rectal temperature had dropped to 100.4 F, and the pulse was 84. The patient was extremely restless but showed no signs of any convulsive seizures. He was given sedatives and antibiotics and 3,000 cc of fluids was administered intravenously during the day. Swallowing was still difficult. Administration of oxygen by nasal catheter was continued.

On the morning of July 26, the sixth hospital day, the constant administration of oxygen was discontinued. Oxygen was administered occasionally by BLB (Boothby, Lovelace, Bulbulian) mask. His temperature did not rise. Blood, 500 cc., and 2,500 cc of fluids were given intravenously. The urinary output remained good, and the urine showed only 1+ albumin with a few red blood cells.

On July 27, one week after the patient's admission, the polyethylene tube was removed from his vein. His rectal temperature was 98.6 F, and his general condition was much improved. He received only 1,500 cc of fluids intravenously during this day. Administration of antibiotics was continued. Roentgenographic examination of the chest on the eighth hospital day revealed an increase in the lung markings, particularly in the right base.

Throughout the remainder of his hospital stay, which lasted until Aug. 7, 1952, the patient improved rapidly. Although the cholinesterase levels returned to normal, it was obvious that the patient was confused, somewhat amnesic, and definitely childlike in his reactions and attitudes. He had a rather severe stomatitis that was felt to be due in part to the antibiotics he had been given and in part to the trauma that resulted from intranasal and intratracheal intubation. He showed a peripheral neuritis that involved the thumb and first finger of the right hand, which presumably resulted from trauma to the antecubital space during convulsions while fluids were being administered intravenously.

At the time of discharge, the urine was normal except for a trace of albumin, routine blood values were entirely normal, and cholinesterase determinations showed a plasma concentration of 119% and a red blood cell concentration of 96%. Determinations of blood sugar, chloride, proteins, sulfobromo-

TABLE 3—Cholinesterase Activity in Blood

Age of Specimen	Cholinesterase Activity in % of Normal *	
	Red Blood Cells	Plasma
Specimen taken directly from donor	100%	133%
Specimen taken immediately after blood was drawn †	110%	133%
1 day	110%	133%
2 days	108%	130%
1 week	108%	132%
2 weeks	104%	118%
3 weeks	100%	110%

phthalein (Bromsulphalein), cephalin flocculation, and icterus index were normal a day after admission. The prothrombin time was very slightly increased.

COMMENT

Observation of this patient suggests to us that the clinical manifestations of parathion poisoning may not be entirely the result of the anticholinesterase activity and consequent acetylcholine action per se but that the anticholinesterase activity and acetylcholine action may represent in part the result of marked changes in electrolytes and serum pH. The possibility that there might be a decrease in cholinesterase activity in blood that has been allowed to stand for some time was entertained, but the decrease was found to be negligible (table 3). We are, of course, well aware that these findings represent only a single instance of severe poisoning and that these observations are unconfirmed and consequently permit no generalization. Individual and variable responses are recognized to be caused by poisons from the anticholinesterase group of parasympathomimetic chemicals. It is also recognized that the changes observed here may be neither characteristic nor typical. It is felt that the action of this group of substances is perhaps imperfectly understood.

SUMMARY AND CONCLUSIONS

Severe, acute parathion poisoning in a 19-year-old man is reported, and the changes in electrolytes and serum pH are noted. In retrospect, we realize, because of the delayed decrease in bronchial secretion and change in size of his pupils, that the patient was given inadequate amounts of atropine during the first eight hours of hospitalization. We feel that his recovery was due in part to more adequate amounts of blood used. The relatively rapid rise in the cholinesterase activity from an extremely low level is thought to have been the result of these transfusions. The advisability of early treatment of parathion poisoning is emphasized, administration of infusions containing properly adjusted and adequate amounts of calcium and sodium bicarbonate is suggested.

Information from the patient's employers and from clinical evidence suggests that poisoning was the result of accidental or careless ingestion of a relatively large amount of the chemical. This emphasizes the importance of scrupulous adherence to safety measures and techniques.

It is not our intention to postulate any new mechanism for the symptomatology of parathion poisoning but merely to mention the possibility that mechanisms do exist in addition to those that have already received attention. We realize that a single isolated case of severe poisoning furnishes inadequate material from which to draw any general conclusions. Our observations on the electrolytic changes, especially the reversal of the calcium-phosphorus ratio and the prolonged elevation of the potassium level, seem to indicate the possibility of a somewhat different approach to an inadequately understood problem. We hope that other, more experienced investigators may, on a larger and more carefully controlled scale, elucidate or refute the importance of these isolated observations.

122 S Kentucky Ave (Dr Annis)

Prognosis in Coarctation of Aorta—Since most children and young adults with coarctation of the aorta do not have symptoms, there is a rather widespread belief that the malformation is an innocuous affair. The fact that a few humans with aortic narrowing have lived to advanced old age has given a false impression that the prognosis is generally not serious. There is now increasing evidence to show that coarctation leads to crippling complications or even fatality in a very large percentage of cases.

A study of the prognosis for humans with coarctation has indicated that about one fourth of them have lived through a rather long life with little or no incapacitation, that about one fourth have died of rupture of the aorta, that one fourth have died from superimposed bacterial endarteritis, and one fourth have died from the hypertensive state. In the last group, death occurred either from cardiac failure or from intracranial hemorrhage.

The average age at death (including persons who have died from coarctation or one of its complications) has been about 30 years. It has become quite clear that, while some subjects may live a long and useful life with coarctation, the abnormality is one which generally brings great hazards to its possessor. It is this knowledge which prompts surgeons to attempt removal of aortic obstructions in the hope of bettering the outlook, particularly in alleviation of the hypertensive state.—R. E. Gross, M.D., *Coarctation of the Aorta, Circulation*, May, 1953.

PARENTERAL ADMINISTRATION OF TRYPSIN

CLINICAL EFFECT IN 538 PATIENTS

Irving Innerfield, M D , Alfred Angrist, M D
and
Alfred Schwarz, M D , New York

Intravenous administration of trypsin consistently produced fibrinolysis in recent dog and rabbit experiments.¹ This observation suggested that intravenous trypsin therapy might affect the fibrin network of human intravascular thrombi. Accordingly clinical studies were initiated, and we now report satisfactory results with trypsin in 71 of 74 patients with thrombophlebitis (63 patients receiving it intravenously and 11 intramuscularly). During treatment of these patients with trypsin it was apparent that the associated signs and symptoms of acute inflammation subsided and cleared up in two to three days, whereas lytic effects on the thrombi occurred much more slowly. This unexpected finding suggested that trypsin initiates biochemical reactions resulting in prompt and sustained subsidence of acute inflammation. Thrombolytic changes apparently occur later. It is the purpose of this paper to present clinical observations based on 6,456 trypsin infusions to 538 patients supporting the view that trypsin rapidly suppresses acute inflammation of diversified origin (bacterial, viral, allergic, and chemical).

METHODS AND MATERIALS

Under sterile conditions a vial containing 10 mg of trypsin was dissolved in 3 cc of isotonic sodium chloride. This solution was then added to 100 cc of isotonic sodium chloride, and 1 cc (10 mg) of methapyriline hydrochloride (Histadyl) was introduced into the flask. Since trypsin in solution loses approximately 40 to 50% of its proteolytic action in three hours, the intravenous infusion was started immediately following preparation of the solution. Each dose consisted of 10 to 15 mg of trypsin dissolved in 100 cc of isotonic sodium chloride solution. A typical course of therapy consisted of 10 mg of trypsin per infusion, twice daily for five to seven consecutive days. Earlier in the investigation larger single doses, 1 cc, 250 mg, were used with no greater therapeutic effects being noted in the conditions under study. The rate of intravenous administration of trypsin did not exceed 30 drops per minute after it was observed that this factor was critical in producing untoward reactions. Citrated and whole blood samples were obtained prior to, at the half-way mark, and at the termination of each trypsin infusion. All prothrombin determinations were done according to the method of Quick. Fibrinogen was determined by the method of Greenberg. The Innerfield, Angrist, and Benjamin method² of antithrombin titer determination was utilized. Factor 5 was measured by the method of Stefanini, and the Conley, Ratnoff, and Hartmann method for fibrinolysis assay was utilized. The coagulation time determinations were done by the Lee and White method. Blood clotting viscosity studies were determined with the use of the Rich-Roth "ultra-viscose" (an electronic instrument that uses ultrasonic waves to measure the viscosity of Newtonian liquids and the

apparent viscosity of non-Newtonian liquids continuously and automatically). In addition the Coombs' test was done, as well as complete blood cell counts and differentials and albumin-globulin ratios.

The patients comprising the study were divided into two groups: (a) control patients, including those with arteriosclerotic heart disease (35), hypertensive vascular disease (35), hypertrophy of the prostate (15), and diabetes mellitus (25), and (b) patients with acute inflammation who were treated with intravenously administered trypsin (428). The control patients were elderly, chronically ill persons selected from the wards of a large municipal hospital, none of whom exhibited gross thrombotic or inflammatory manifestations. The patients who presented evidence of acute inflammation received either complete or incomplete courses of intravenously administered trypsin (see table). The anatomic distribution of thrombophlebitis included the calf, the popliteal region, and the thigh. The signs and symptoms consisted of pain, edema, redness, Homans' sign, fever, elevated sedimentation rate, leukocytosis, and inability to walk. Since in this study the acute inflammatory reaction following thrombophlebitis was not microbial in origin, antibiotics were not used during this investigation. Prior to hospitalization, several patients were treated at home with bed rest and antibiotics without effect. All patients with arthritis presented evidence of rheumatoid arthritis according to the standards of the New York Rheumatism Association as given by Steinbrocker, Tragger, and Batterman. Clinical and roentgenographic evidences of peripheral rheumatoid arthritis were obtained, and only patients having a chronic, but active, course of the disease were selected for treatment. Activity was determined by joint immobility, heat, soft tissue swelling, redness, joint effusion, pain, tenderness, fever, leukocytosis, and an elevated sedimentation rate. The patients were both men and women, with ages ranging from 19 to 64 years,

Mr Daniel Pitcoff gave technical assistance. Dr Franklyn Theis Jr, Nyack, N. Y. supervised the care of six patients with retinal thrombosis.

The trypsin used in the experimental and clinical work was obtained from the Armour Laboratories (Trypsin and Enzar) and the National Drug Company (Parezyme and Parezyme in oil).

This study was supported by grants-in-aid from the David Schwartz Research Fund of the Jewish Memorial Hospital, New York, the Armour Laboratories, Chicago, the Eli Lilly Research Foundation, Indianapolis, and the National Drug Company, Philadelphia.

Assistant Professor of Physiology (Dr Innerfield) and Clinical Professor of Pathology (Dr Angrist), New York Medical College Research Associate in Pathology and Chief of the Clinical Enzymology Clinic (Dr Innerfield), Director of Pathology (Dr Angrist) and Associate Pathologist and Associate Hematologist (Dr Schwarz), Jewish Memorial Hospital. Also affiliated with the Flower and Fifth Avenue Hospitals and the Metropolitan Hospital.

the average being 43. The duration of the disease varied from 6 months to 20 years, with an average of 11 years. Thus, this study comprised a group of patients in whom

plasma antithrombin and prothrombin inhibitor determinations were performed before and at the midway point of each trypsin infusion.

Clinical Results of Parenteral Administration of Crystalline Trypsin in 428 Patients

Diagnosis	No of Patients	Average No of Treatments	Average Single Dose, Mg	Average Days of Treatment	Results
Acute rheumatoid arthritis	18	9	15	7	Rapid reduction in edema, less pain, greater range of motion, lowering of ESR in 15 patients. 3 relapses.
Acute gouty arthritis	7	7	10	6	Prompt subsidence of signs of acute inflammation in 5 patients. One patient showed improvement after 5 treatments. One did not respond.
Acute thrombophlebitis	74	11	10	6.5	Rapid decline in signs and symptoms of acute inflammation in 71 patients. Three embolic patients (carcinomatous) did not respond.
Thromboangitis obliterans	8	10	10	7	Prompt relief of intermittent claudication. Each patient relapsed within 4 weeks. Symptoms again controlled under ambulatory treatment with trypsin.
Coronary thrombosis	7	8	10	8	One death. Remaining 6 patients made uneventful recovery.
Atypical virus pneumonia	9	10	10	0	Prompt reduction in cough, ratch and expectoration. General improvement within 36 hr.
Basilar artery thrombosis	3	20	10	14	Patients improved. No conclusive evidence of trypsin effect.
Cerebral thrombosis	9	20	10	14	Same as above.
Popliteal embolus	5	10	50	5	No improvement.
Saddle embolus of aorta	2	10	50	2	No effect. Both patients died 48 hr after seen.
Massive thrombosis varices of anterior abdominal wall	2	15	15	15	Complete disappearance of thrombi 4 weeks after termination of treatment.
Diabetic carbuncle	4	10	15	15	In each instance mass was softened and ready for incision and drainage within 48 hr.
Ischemic purulent leg					
Ulcers	18	20	10	20	
Diabetic gangrene of toe	19	20	10	15	Good clinical response only in those cases presenting an acute inflammatory component.
Diabetic ulcer of leg	31	20	10	15	
Postoperative thrombophlebitis	12	10	10	7	Disappearance of acute inflammatory component in 48 hr.
Post thrombophlebitis syndrome	8	15	10	15	
Chronic thrombophlebitis	4	20	10	20	Reduction of edema after 4-6 treatments.
Phlebotrombosis	10	20	25	14	
Tuberculous adenitis	5	10	50	7	Disappearance of acute signs. Spontaneous rupture of abscess.
Acute meningococcalitis	3	14	10	10	Dramatic drop in temperature within 48 hr, marked clinical improvement.
Influenza	7	14	10	10	
Cystic fibrosis of the pancreas	2	7	10	7	Marked thinning of bronchial secretions. One patient treated in terminal stage died. Autopsy confirmed thinning of secretions.
Acute bronchitis	18	7	10	5	Drop in temperature within 48 hr.
Chronic bronchitis	7	12	10	12	
Chronic bronchiectasis	12	15	10	25	Thinning of mucous secretions eased symptoms.
Scleroderma	2	20	10	20	Initial marked improvement of skin tension relapse after 4 weeks.
Boeck's sarcoid	1	20	10	20	No effect.
Empyema	5	15	15	15	Drop in temperature after 48-72 hr, thinning of the exudate, easy drainage.
Lung abscess	3	15	15	15	
Infected bronchopleural fistula	7	15	25	15	Amelioration of symptoms, thinning of mucus.
Bronchial asthma	17	15	10	20	
Atopic dermatitis	7	8	10	8	
Pustular eczema	3	8	10	8	
Acute eczematoid dermatitis	5	8	10	6	Subsidence of the signs and symptoms of acute inflammation in 24-48 hr.
Herpes zoster	4	8	10	8	
Dühring's disease	2	8	10	6	
Neurodermatitis	3	8	10	3	
Acute sinusitis	14	5	10	3	Subsidence of acute signs in 48 hr.
Chronic sinusitis	5	5	10	3	
Peritonsillar abscess	3	5	10	3	Softening of swelling and drop in temperature in 24-48 hr.
Thrombosis of central retinal artery	3	10	15	8	No effect.
Thrombosis of central retinal vein	12	10	15	8	Subsidence of retinal edema in 24-48 hr.
Acute iridocyclitis	5	10	10	8	Dramatic improvement within 3-5 days.
Glaucoma	3	10	10	10	Improvement of symptoms in 3-5 days. Recurrence occurred in each case ameliorated by follow up treatment.
Lymphogranuloma venereum	3	4	10	4	Subsidence of mass, fever and pain.
Acute gonorrheal urethritis	3	10	10	8	Subsidence of acute signs in 24-48 hr.
Proteus vulgaris infection of urinary tract	7	10	10	8	Urine cultures became sterile.
Acute hemorrhagic cystitis	2	10	10	8	Recurrence in 4 cases of Proteus vulgaris infection which cleared after repeat treatment.
Infected pilonidal abscess	5	10	25	8	Subsidence of acute inflammatory signs in 48-72 hr.
Acute proctitis	2	10	10	10	
Acute ulcerative colitis	3	14	10	14	Drop in temperature in 72 hr. Reduction of bowel movements to 2 formed stools daily.

extensive changes had occurred and in whom there was a pronounced degree of limitation of activity. The duration of the acute phase of the illness varied from 8 to 72 hours. In order to detect excess blood trypsin levels,

LABORATORY RESULTS

Some of the laboratory results are summarized in the table. A decrease in prothrombin to 86% of normal as determined by the Quick method, in which the normal

value is 12 to 14 seconds, was observed after the administration of 100 mg of trypsin. Except for a moderate increase in prothrombin time, none of the factors measured showed a marked deviation from the normal level in the dose range of trypsin employed, i.e., doses up to 400 mg. With the Greenberg method, the fibrinogen levels in the controls dropped from 350 mg to 330 mg per 100 cc with the 400 mg trypsin dose. No changes whatever occurred in the fibrinogen level when trypsin was given in doses up to 350 mg. As measured by the Innerfield, Angrist, and Benjamin method, the antithrombin titer was 25 seconds after a five minute incubation period. This compared with 25 seconds at the 400 mg trypsin dose level. Thus the antithrombin titer was not altered during the administration of the aforementioned trypsin dose. The normal level of factor 5 as measured by the Stefanini method, was 750 units. It was determined that there was a very slight but steady decrease in factor 5 with each increment in trypsin dosage, however, 705 units at the 400 mg level compared favorably with the control level of 750 units. With the Conley, Ratnoff, and Hartmann method, fibrinolysis was determined in patients given increasing levels of a single massive infusion at the end of 48 hours at 37 C. After the 100 mg level of trypsin infusion was given, the clots of the patients showed fibrinolysis, whereas some samples presented fibrinolysis after the administration of 300 mg and 400 mg. There was a slight but steady prolongation of the coagulation time from a five minute pretreatment level to eight minutes at the 400 mg trypsin level, as determined by the Lee and White method. Patients given trypsin intravenously showed a drop in blood clot viscosity ranging from 10 to 30 centipoises as measured by the "ultra-viscoson" method (see figure). The maximal depression in blood clotting viscosities was obtained when doses exceeding 100 mg per infusion were given. No agglutination occurred when in vivo trypsin-treated red blood cells were added to the serum of patients having the same blood group, and no increased agglutination occurred when anti-Rh serum was added to such cells. The same lack of response occurred when trypsin-treated serum was added to red blood cells of the same group. Thus, the erythrocytes of those patients who received trypsin behaved in a normal fashion, indicating that the red blood cells are not affected by antigenicity. The laboratory evidence is in accord with our clinical observations. Blood from trypsin-treated patients gave a negative Coombs' test reaction. No changes were noted either in the erythrocyte count or in the erythrocytes in the stained blood smears when taken prior to and following administration of trypsin.

CLINICAL RESULTS

Control Patients—Patients with arteriosclerotic heart disease, hypertensive vascular disease, hypertrophy of the prostate, and diabetes mellitus comprised a control group. In this manner we established a base line in alterations in certain fundamental physiological aspects of the coagulation mechanism, we ascertained the nature and incidence of side-effects at various dose levels and determined the optimal rate of administration and enzyme concentration. With the exception of a sense of well-being that usually appeared during the first infusion,

the administration of trypsin to these patients had no influence on the underlying illness or on factors comprising the clotting mechanism.

Patients with Acute Inflammatory Reactions—The clinical results are summarized in the table 1. Ischemic Leg Ulcers. Critical appraisal of any therapeutic agent given to patients with ischemic leg ulcers is difficult because of variable factors such as nutritional status, extent of arteriosclerotic involvement, duration and extent of the ulcerated area, degree of gangrenous change, and the presence of associated disease. In most instances, however, it was obvious that subsidence of the accompanying acute inflammatory reaction occurred following completion of the first few trypsin infusions. Liquefaction of exudates frequently followed the first infusion and was almost invariably present after subsequent infusions. During therapy eschars usually dropped off spontaneously or were readily removed revealing underlying areas of healthy granulation tissue. 2. Diabetic Gangrene. Considerable improvement in the inflammatory component followed the intravenous administration of trypsin to patients with diabetic gangrene of the feet. It is significant that the patients who responded well to trypsin

Comparison of 'ultra viscoson' curves before and after trypsin infusion.

therapy did not have extensive gangrenous involvement, although in each instance the accompanying deep cellulitis was rather widespread. The patient who was considered a therapeutic failure had widely disseminated areas of wet gangrene plus superimposed infection, an important trypsin-induced result was a nonextending line of demarcation between dead and viable tissue, which facilitated surgical separation. Each of the successfully treated patients was given daily intravenous infusions for five days. In one case separation of the gangrenous eschar occurred on the third day of treatment, and in some cases eschar separation occurred on the fourth day. On the fifth day following incision and drainage of fluctuant areas, considerable thin pus gushed forth. The follow-up treatment consisted of daily topical application of 100 mg of trypsin powder with a no. 119 DeVilbiss atomizer and daily débridement of ulcerated areas. Healthy, abundant granulation tissue appeared on the 9th, 10th, and 15th days of treatment. It is critically important to treat ulcer areas with daily washings of Sorensen's phosphate buffer solution, followed by trypsin powder and mechanical removal of the loosened debris under sterile conditions. 3. Infected Diabetic Ulcers. Gratifying results, surpassed only by those seen in the postpartum thrombo-

phlebitis cases, were obtained in diabetic patients with cellulitis and ulceration of the feet or toes, but without extensive gangrene. It is interesting and probably significant that the first favorable signs elicited in the trypsin-treated thrombophlebitis and infected ulcer patients were of the same pattern. These included subsidence of edema in the involved part, restoration of healthy tissue color, improved mobility, and marked subsidence of pain.

4 Thrombosis of Central Retinal Vein Ten of the 12 patients presented dramatic and prompt improvement as noted by restoration of vision, daily improvement in visual fields, blood coursing through the retinal vessels on exerting orbital pressure, subsidence of retinal edematous changes, and diminution in size of retinal exudates. Two patients who did not respond had pathological involvement of the longest duration, i.e., exceeding two months. Ten patients received 10 mg of trypsin intravenously for three to seven days, while two successfully treated patients received trypsin intramuscularly. It is interesting to note that one of these patients had hypertensive vascular disease with a blood pressure of 240/160 mm Hg.

5 Thrombophlebitis These patients showed remarkable improvement. In fact the most striking and prompt results in the entire study were observed in patients with postpartum thrombophlebitis. In each instance subsidence of pain, edema, local heat, fever, leukocytosis, and Homans' sign, and a fall in sedimentation rate occurred within the first few hours after trypsin treatment. The dosage consisted of 10 mg of trypsin per infusion twice daily for one to eight days. The minimal total quantity of infused trypsin associated with clinical improvement was 30 mg, the maximum quantity of infused trypsin associated with unequivocal improvement was 220 mg. Patients in this study with post-thrombophlebitis syndrome benefited from complete courses of intravenously administered trypsin in that their chief disabling symptom, persistent edema of the involved extremity, improved considerably. In no instance did the edema disappear entirely. Nevertheless, the degree of improvement was sufficient to permit each patient to return to full-time employment. In three patients who were treated for thrombophlebitis associated with cancer of the pancreas (two) and prostate (one) thrombophlebitis of the uninvolved leg developed before completing successful treatment of the original phlebitis. Following further treatment the second thrombophlebitis cleared.

6 Thromboangiitis Obliterans Patients with longstanding thromboangiitis obliterans received complete courses of intravenously administered trypsin. While no objective signs of improvement were observed, each patient stated that while under treatment there was lessening of rest pain and intermittent claudication. These symptoms recurred within four weeks of terminating therapy but were again relieved by biweekly injection of trypsin.

7 Coronary Occlusion Three of the patients were considered to have recovered from recent myocardial infarctions prior to trypsin therapy except for frequent episodes of substernal discomfort. No untoward signs developed during the course of treatment or throughout subsequent periods, and anginal attacks occurred less frequently and were milder. In addition the patients'

entire mental outlook became more cheerful. Three patients with more recent coronary occlusions were treated within 24 hours of the onset of acute symptoms. Each patient made an uneventful recovery. The evolution of the disease pattern in these few patients was characterized by clinical, laboratory, and electrocardiographic improvement. In these patients the intramuscular route of administration is preferred.

8 Acute Rheumatoid Arthritis Following the first few intravenous infusions striking improvements were noted, including diminution of pain, decrease in swelling, increase in mobility of joints and functional capacity, and a marked sense of well-being. Where there had been extensive damage to the bones, residual deformities were unaffected. In two cases acute symptoms recurred four and six days, respectively, after treatment was completed. None of the other patients had a relapse. A maximal degree of over-all improvement occurred within 24 to 72 hours after therapy was started. Three patients required from 48 to 72 hours to show maximal improvement, and these were in the oldest age group, 52 to 64. The remaining 15 patients were less than 50 years old, and each showed maximal improvement within 48 hours of commencing treatment. The patient requiring the longest time to show improvement, 72 hours, was the oldest in the series (64 years), had his disease the longest (20 years), and had the lowest red blood cell count (2,900,000 per cubic millimeter of blood). Although treatment was continued for five more consecutive days in most instances, there was no correlation between the duration of treatment or total dosage and the ultimate degree of improvement. No toxic side-effects followed the use of intravenously administered trypsin in this study. Occasionally, mild symptoms of frequency in urination, slight epigastric pain, or slight throbbing headaches were elicited over a short period of time. It is evident from the laboratory and clinical results that decided and prompt improvement followed the intravenous administration of trypsin to patients with acute rheumatoid arthritis. While, generally speaking, the natural course of rheumatoid arthritis makes the evaluation of therapeutic agents for this condition exceedingly difficult, spontaneous improvement is usually a gradual phenomenon. The quick remission consistently affected by intravenously administered trypsin would seem to exclude the possibility of spontaneous variation.

SIDE-EFFECTS

The 538 patients studied in this series received a total of 6,456 trypsin infusions. When the drug is given slowly, the only side-effect is transient facial flushing and a sense of warmth, occurring in 12% of the patients treated and lasting for an average of two to three minutes. A direct relationship exists between the quantity of trypsin injected and the incidence and severity of reactions. Single infusions of more than 400 mg of trypsin were associated with a high incidence of side-effects, which, as a general rule, were mild and transitory. Significantly, the 10 to 15 mg level of individual trypsin infusions was clinically effective and presented negligible side-effects. During earlier stages of this investigation when considerably higher doses were employed mainly in a 50 to 250 mg range, endophlebitis frequently oc-

curred at the site of infusion. The incidence of this side-effect has been reduced considerably since smaller trypsin doses have been used in the 10 to 15 mg range per infusion. It is interesting that decreased prothrombin inhibitor levels were present in the few diabetic patients in whom local phlebitis developed, despite smaller dose levels. In more than 98% of the patients receiving trypsin intravenously in the small dose range, however, local phlebitis never developed. This group manifested prolonged prothrombin inhibitor levels. In these studies we did not employ anticoagulants in order to exclude therapeutic variables. Since making this report, however, we have occasionally employed anticoagulants together with intravenously administered trypsin in thrombotic patients, the dose of trypsin did not alter the prothrombin level.

REPORT OF CASES

CASE 1—A 53 year-old white laborer entered Metropolitan Hospital, Welfare Island, with 8 by 14 cm and 6 by 12 cm infected ulcers on both legs that had been treated with periods of bed rest, at least four to six weeks, plus extensive local and systemic therapy, the ulcers were sufficiently changed for a few days to permit limited ambulation. An infusion containing 10 mg of trypsin in 100 cc of sodium chloride solution was given after the patient had been confined to bed for 12 days, at which time there was essentially no change in the infected ulcers since last seen at the hospital seven months previously. Two infusions, each containing 10 mg of trypsin, were given daily for the following four days without the development of untoward reactions. On the third day of the treatment the patient stated his legs felt "warmer and much better," and objective evidence of improvement such as absence of purulent exudate and appearance of granulation tissue was evident on the fourth and fifth days. On the sixth day after institution of therapy the patient became ambulatory. When seen in the clinic four weeks later the ulcer on the right leg had remained healed and a smaller ulcer had appeared on the left leg. The latter was treated successfully with trypsin powder applied locally. Except for a slight recurrence of pain in the area of the small ulcer, the patient was greatly improved.

CASE 2—A 49 year-old Jewish widow with known hypertension for many years was admitted to the hospital with blurring vision, which had occurred on awakening three weeks previously. This had been diagnosed by an ophthalmologist as thrombosis of the central vein of the retina. No visual improvement was noted prior to admission, and another ophthalmologist confirmed the diagnosis and visualized a thrombus in the superior temporal vein. Arterial but no venous pulsations were observed. The patient received 10 mg of trypsin on May 16, 10 mg divided equally in two doses on May 17, 10 mg on May 19, and 10 mg on May 21. Following the administration of the first 10 mg of trypsin, vision was considerably improved and fundal examination revealed a return of the venous pulsation and blood flow. On admission finger counting was at 15 ft, whereas on discharge the vision was 18/100.

CASE 3—A 21-year-old Puerto Rican housewife entered the hospital because of pain and marked tenderness of the right lower extremity of three weeks' duration. She was unable to walk because of pain and had been confined to bed continuously for the past two weeks. Four weeks prior to admission she delivered a healthy child following an uneventful gestation. One week post partum, the patient experienced pain in the right calf region associated with moderate swelling extending to the thigh. Physical examination revealed tenderness and 2+ edema of the entire right lower extremity. The right leg was much warmer than the left. The diagnosis was acute post-partum thrombophlebitis, and a course of intravenously administered trypsin was recommended. On the second day of treatment, and after having received four doses of 10 mg of trypsin each, there was considerable subjective and objective improvement. Following an additional four infusions of 10 mg each (eight infusions in four days), the patient was entirely symptom free and the signs of thrombophlebitis had completely cleared.

CASE 4—A 58 year old white man was admitted to the Metropolitan Hospital because of painful swelling of the lower third of the right leg for the preceding three weeks, in addition he had polyuria, polydipsia, and weight loss of 41 lb (18.6 kg) over the past month. Physical examination of the right leg revealed redness, swelling, and tenderness over the lower third, measuring 10 by 14 cm. Immediately superior to this erythematous zone a deeply situated, exquisitely tender cord like structure was palpable. The diagnosis was thrombophlebitis, with a localized area of erythema. Treatment consisted of continuous bed rest plus a full course of trypsin administered intravenously. On March 13, five days after admission, two infusions of trypsin solution were given, each containing 10 mg in 100 cc of isotonic sodium chloride solution. This dose and frequency of daily administration were repeated on the following three days. At no time were reactions noted. On March 14, the discolored area became considerably lighter and less extensive and the cord like structure was smaller and less tender. On the following day the patient stated that he felt better and wished to get out of bed, the area of discoloration on the right leg had become much smaller and lighter, and the cord like structure had decreased in size and was less painful. On March 16, because of further subjective and objective improvement, he was permitted out of bed for the first time in almost a month. At this stage, after administration of eight infusions of trypsin over four days, therapy was discontinued. On March 20, there was no evidence of thrombophlebitis in the right leg and a follow up examination made six weeks later revealed no recurrence of symptoms.

CASE 5—A 30 year-old Puerto Rican housewife entered the hospital unable to walk owing to severe pain and tenderness over the lower medial aspect of the left thigh for the preceding three weeks. Examination revealed an irregular, crescentic, stony, hard, hot, tender mass on the inner aspect of the lower third of the left thigh. The surrounding skin was lichenose and erythematous. A diagnosis of thrombophlebitis was made, and after five days of bed rest plus anticoagulants without improvement a course of intravenously administered trypsin was recommended. On the first day of therapy two infusions of trypsin, each containing 250 mg, there was less pain in the thrombosed area, the mass was smaller and less tender, the overlying skin was less shiny and erythematous. The following day two infusions were given, each containing 250 mg, without producing unusual reactions despite the high dosage. This patient was treated early in the investigation when the usual single dose was 250 mg. On the third day the patient accepted the first 250 mg but refused the second because she felt "cured" and accordingly signed a hospital release. A follow-up examination made at her home three days later revealed marked regression in the size of the thrombus as compared with the size on admission as well as practically complete clearance of the overlying erythema. The patient has been able to conduct her household duties uninterruptedly since returning home.

CASE 6—A 37 year-old Puerto Rican woman was admitted to the Metropolitan Hospital because of massive, bilateral serpiginous like masses on the medial aspect of both thighs. There was a three month history of painful swelling over the inner side of the left thigh, with onset one week before of a similar, but somewhat smaller, painful swollen, sausage-shaped mass along the inner side of the right thigh. Examination revealed an extremely tender, red, indurated area over the medial portion of the left mid thigh, measuring 22 by 11.5 cm. Coursing through the center of the erythematous zone was a markedly dilated, firm, hard thrombotic vessel. A smaller mass was present on the medial side of the right thigh. A diagnosis was made of bilateral thrombophlebitis of both thighs. Treatment consisted of bed rest and a course of intravenously administered trypsin. On March 7, six days after admission to the hospital, 10 mg of trypsin dissolved in 100 cc of isotonic sodium chloride solution was given intravenously. At the conclusion of the infusion a slight chill occurred. On the following day there was less pain and redness of the left thigh and the right thigh remained painful and tender. Two 10 mg trypsin infusions were then given and repeated on the following three days, March 9, 10, and 11, without the development of untoward reactions. On March 9 her condition was about the same, however on

March 10 there was considerable decrease in the size and associated tenderness of the masses on both thighs and the area surrounding the erythema was much lighter and less extensive. On March 16 the patient was discharged considerably improved and ambulatory. At the follow-up examination, two weeks later, fluctuant tender masses were palpable over the inner sides of both thighs. Following incision and drainage, considerable sterile pus was evacuated from each area. At her visit to the clinic two weeks later both thighs appeared normal.

CASE 7—A 42-year-old white truck driver was admitted to Nyack Hospital, Nyack, N. Y., complaining of severe, crushing, substernal and precordial pain of several hours' duration. On admission the temperature was 99.6 C, pulse rate 130, respirations 40, blood pressure 100/70 mm Hg, white blood cell count 17,100 per cubic millimeter of blood, and sedimentation rate 40. The lungs were clear, the point of maximal impulse in the sixth intercostal space at the anterior axillary line, the heart sounds somewhat distant but of regular rhythm, and no thrills palpable. The liver was slightly enlarged, and the extremities were normal. The electrocardiogram showed recent myocardial infarction, anteroapical type. Treatment consisted of seven trypsin gluteal intramuscular injections, each containing 5 mg of the enzyme, plus sedation. After the first treatment on the day of admission the substernal and precordial pain subsided considerably, and only minor complaints of pain were noted throughout the remaining period of hospitalization. Serial electrocardiograms showed the usual subsiding pattern of myocardial infarction, and the sedimentation rate became normal on the fifth hospital day. Bed rest was maintained for three weeks.

CASE 8—A 33-year-old woman had moderately severe rheumatoid arthritis for 24 months, affecting principally the knees, feet, ankles, wrists, and hands. Over a period of years treatment was unsuccessful and had consisted of physical therapy, blood transfusions, gold therapy, typhoid vaccine, and corticotropin (ACTH). Three days prior to admission her left knee became swollen. After three daily intravenous infusions of trypsin, each dose consisting of 10 mg in 100 cc of isotonic sodium chloride solution, the signs and symptoms of acute inflammation involving the left knee had subsided completely. In addition, there was, in general, less pain and stiffness in the other joints less acutely involved at the time. The range of motion of the fingers and wrists was increased considerably. This improvement had been maintained for the preceding two months.

CASE 9—A 62-year-old white schoolteacher visited the office of one of us (I. I.) with the complaint of massive thrombi that had been present on the anterior abdominal wall for the preceding eight years. The patient stated that eight years previously, following an abdominal operation, thrombophlebitis developed with extensive and severe involvement of the left lower extremity. As a direct result of this phlebitis (probably extending into the vena cava, according to the family physician) numerous dilated venous channels appeared on the lower anterior abdominal wall. Six months after these venules were first apparent they became confluent and remained thrombotic ever since. The diagnosis at the time of instituting intravenous administration of trypsin eight years later were post-phlebitis syndrome in the left lower extremity and extensive phlebothrombosis of the anterior wall of the abdomen. Treatment involved 10 daily trypsin infusions consisting of 10 mg in 100 cc of sodium chloride solution. The patient remained ambulatory throughout treatment. At the end of this course there was subsidence of edema of the left lower extremity. The confluent masses of thrombi on the anterior abdominal wall were still present, but appeared definitely

smaller, more irregular, and softer. The patient returned for a follow-up examination four weeks later, at which time there was no longer any evidence of thrombosis of the anterior abdominal veins. During a six months follow up period the thrombi did not recur. Moderate edema of the left lower extremity has persisted.

DOSAGE AND INDICATIONS FOR TRYPSIN

In animal experiments, we have demonstrated that excessive blood trypsin levels can effectively destroy the clotting mechanism.³ This varies with the individual animal as well as with the dosage. For purposes of clinical control, therefore, it is advantageous to check midway through each infusion for excess blood trypsin levels during the infusion. Two methods have been devised by us for determining the extent to which blood trypsin is present in excess quantities. The plasma antithrombin level is perhaps more closely linked with blood trypsin content than any other circulating antitryptic substance.⁴ Moreover, since antithrombin is an unusually stable protein we have noted that decreasing antithrombin levels following intravenous administration of trypsin means concomitant proteolysis of other and less stable clotting moieties, including factor 5 and prothrombin.⁵ The imminence or actual presence of peptone shock is apparently linked with the stage of extensive proteolysis of clotting moieties. Thus, maintenance of normal antithrombin levels is of critical importance. It should be stressed that our purpose was to lyse the fibrin content of thrombi without unduly compromising the coagulating mechanism. Citrated blood samples were obtained during the course of trypsin treatments for immediate "five minute incubation" antithrombin determinations. In this manner trypsin infusions became subject to careful and continuous control. It is gratifying to mention that none of the patients reported on in this series, including the few who earlier in our studies received as much as 750 mg in a single infusion, demonstrated diminution in antithrombin titer. In dogs diminution in antithrombin was observed when larger doses of trypsin were employed. This significant observation is correlated with the fact that, despite clinically effective fibrinolysis, the coagulation mechanism in humans remains essentially intact following intravenous administration of trypsin in the prescribed dosage range and rate of administration.

The second laboratory method utilized routinely as a method for estimating the extent of proteolysis induced by trypsin is a test that we refer to as the "prothrombin inhibitor determination." In brief, the procedure involves the following steps: Introduction of 2.5 cc of isotonic sodium chloride into a vial containing 10 mg of crystalline trypsin.^{6a} Withdrawal of 0.024 cc of this trypsin solution with a tuberculin syringe, and adding it to 0.3 cc of the patient's plasma. Determination by means of a stop watch and a wire loop the length of time for a fibrin strand to first appear. At 37 C (water bath) the average length of clotting time ranges from 25 to 30 seconds. A normal control determination with normal plasma is run simultaneously. It has been our observation that a patient undergoing trypsin therapy shows prolongation of the "prothrombin inhibitor time." If at any time this test reveals marked diminution in the prothrombin inhibitor time trypsin should be discontinued at once. All patients have prothrombin inhibitor time

6a The National Drug Company Philadelphia has prepared a special 10 mg trypsin vial for performing this test.

determinations prior to institution of trypsin therapy. Trypsin therapy contraindicated in patients with markedly decreased prothrombin inhibitor time prior to trypsin therapy.

The primary purposes of intravenous trypsin therapy are (1) to depolymerize long-chained protein molecules, i.e., hydrolysis of the fibrin molecule, (2) to decrease the viscosity of encapsulated fluid, (3) to augment phagocytosis, (4) to enhance the biochemical process of liquefaction of purulent debris and inspissated thick viscid mucus, and (5) to cause reversal of acute inflammatory processes. It is important to note that decreased blood clot viscosity, fibrinolysis, and effective lysis of intravascular thrombi followed intravenous administration of trypsin when done in the previously outlined fashion, without otherwise jeopardizing the coagulation system, clinically, the cardinal indication for trypsin is acute inflammation, regardless of etiology.

Thus far, contraindications to intravenously administered trypsin appear to include hepatic insufficiency, congestive heart failure, cachexia, hemorrhagic states, and conditions associated with necrosis of vital tissues and severe anoxia, such as in advanced pulmonary emphysema and pulmonary fibrosis. Markedly depressed prothrombin inhibitor levels are considered an absolute contraindication.

EFFECTS

Infiltration of the infusion into healthy tissue did not produce necrosis or sloughing owing to the adequacy of antitryptic substances present in all living cells. There does occur, however, a short painful sensation in the region of the infiltration. Sloughing of healthy tissue is produced by alpha, beta, and gamma chymotrypsin and not by trypsin. Sensitization phenomena following intravenous administration of trypsin have not been observed in this study. It is well recognized that proteins of low molecular weight, like trypsin, seldom produce sensitization phenomena, however, when intervals exceeding three weeks occur between intravenous courses of trypsin. Intradermal and conjunctival tests should be made prior to the reinstitution of therapy. Although no evidence of sensitivity reactions has been encountered in the follow-up clinical cases, it is recommended that under no circumstances should a second course of intravenously administered trypsin be given without testing for evidence of hypersensitivity.

The effect of increasing dose levels of intravenously administered trypsin on certain clotting constituents in dogs has been reported by us.¹ Continuation of this study with both rabbits and dogs has provided additional data and insight into the physiological effects of intravenously administered trypsin on the coagulation mechanism and has enabled us to develop a method for safely administering trypsin intravenously in man. Previous workers reported that trypsin was too toxic for intravenous use,⁶ produced shock, necrosis and sloughing of tissue sensitivity reactions,⁷ and intravascular coagulation.⁸ It is possible, indeed probable, that the particular trypsin employed by these workers in 1942, 1944, and 1945 was far different from the highly purified crystalline product used in our experiments. The slightest contamination of trypsin with chymotrypsin or carboxypeptidase can

produce serious side-effects following intravenous administration.

Intravascular coagulation following the intravenous administration of purified trypsin has not been observed by us during animal and human studies. Large doses of such trypsin have powerful anticoagulant effects.² Shock, death, and small intracardiac thrombi have been observed to follow massive, rapid intravenous administration of trypsin in rabbits, but shock did not occur and intracardiac thrombi were not seen when the enzyme concentration and the rate of administration were within specific prescribed limits.^{1a} In order to appraise the anticoagulant and fibrinolytic effects of trypsin it should be stated that the clotting mechanism is merely one part of a more comprehensive "coagulation system." Under normal physiological circumstances the absence of intravascular clotting reflects the adequacy of circulating clot inhibitors. The fluid state of the blood stream is maintained through the participation of these clot inhibitors and other naturally occurring anticoagulants, comprising a highly effective over-all plasma proteolytic enzyme system. Yet, small doses of trypsin in vitro produce clots. The following hypothesis is applicable to the explanation of the differing action of in vivo and in vitro trypsin. As in all dynamic biological processes, moieties comprising the coagulation system are constantly being degraded and synthesized in vivo. Moieties consumed in in vitro clotting, or following in vitro proteolysis, obviously cannot be resynthesized. When trypsin in small doses produced clots in vitro, it does so by digesting the prothrombin inhibitor grouping, i.e., digestion of the inhibitor molecular grouping from the prothrombin molecule enables prothrombin to convert into thrombin autocatalytically. This suggests that prothrombin molecules are less susceptible to small doses of trypsin than prothrombin inhibitor groupings. It is further suggested that the prothrombin inhibitor molecule complex has a protein configuration and is not too long-chained, since it is so readily attacked by trypsin in small doses. Experimental evidence confirms this observation. If this were not so, that is, if prothrombin were not "coated" by a "precursor molecular grouping" small in vitro doses of trypsin would attack prothrombin at once. An excess of in vitro trypsin proteolyzes not only the prothrombin molecular inhibitors but also prothrombin itself, factor 5, and fibrinogen. Thus excess in vitro trypsin destroys all clotting substances. In vivo clotting cannot occur following small doses of trypsin, however, provided the synthesis and replacement rate of digested clot inhibitor groupings exceed the rate and extent to which these moieties are proteolyzed. The plasma proteolytic enzyme system, plasmin, antithrombin, antirennin, and chymotrypsin inhibitor substances, further vitates possible intravascular clotting effects of intravenously administered trypsin within specific limits of trypsin concentra-

tion and rate of administration. Large doses of intravenously administered trypsin digest both clotting and anticlotting protein moieties of the coagulation system.^{1a} Thus, under normal conditions, maintenance of a fluid circulation following the parenteral administration of small doses of trypsin reflects the capacity of the liver to regenerate clot inhibitor moieties either faster or just as fast as they are proteolyzed. If the dose of trypsin is steadily increased (continuous infusion), it is apparent that a level of enzyme concentration will be reached that exceeds the capacity to elaborate essential clotting moieties at a rate equal to that of proteolysis. It is precisely during this excessive enzyme dose range, as given to animals,^{1a} that anticoagulant, fibrinogenolytic, and fibrinolytic effects of intravenously administered trypsin become apparent. It may well be that the relative size of the molecules of these coagulant and inhibitor moieties determines their selective action to trypsin. The simpler, shorter inhibitor molecules are readily formed by the liver and are rapidly replaced following degradation.

The activation of a blood proteolytic enzyme system by trypsin requires far smaller quantities of trypsin and recently has been reported by three groups working independently.⁹ Clinical observations reported in this paper support and extend those views, namely that trypsin converts plasminogen into active plasmin. Trypsin in solution is known to deteriorate rapidly, losing 40 to 50% of its activity in the first three hours, yet for weeks after cessation of trypsin therapy routine blood findings indicate increased fibrinolysis and increased prothrombin inhibitor levels. Clinically, as for example, in the patient cited with varices of the abdominal wall, therapy with trypsin resulted in maximal alteration and eventual disappearance of massive thrombosis, however, the thrombolysis occurred several weeks after trypsin therapy had been terminated. Similarly, patients with postphlebitis syndrome or chronic thrombophlebitis of long duration often manifest subsidence of edema many weeks after cessation of the treatment. Since it is inconceivable that the minute doses of trypsin used per se could maintain activity for several weeks, the immediate trypsin activation of naturally occurring proteolytic enzymes, such as the conversion of plasminogen to plasmin, is postulated. Once activated, these proteolytic enzymes continue functioning for several weeks. It is entirely possible that clinical effects are due to activation of the proteolytic enzyme system, not trypsin at all.

COMMENT

The prompt and striking improvement observed in patients with ischemic purulent leg ulcers strengthens the view that parenterally administered trypsin significantly

alters the inflammatory reaction. Similarly, signs and symptoms of cellulitis accompanying acute thrombophlebitis subsided promptly after administration of trypsin. Striking improvement also followed administration of trypsin in patients with retinal thrombosis. It is significant that in the patients who did not respond favorably retinal artery thrombosis had developed two months prior to institution of treatment. The patients who responded to treatment had venous thrombotic episodes two or three weeks before treatment was started. The 71 patients with thrombophlebitis, responding favorably to trypsin, showed diminution in size, shape and consistency of superficial thrombi in situ within 24 to 48 hours after commencing treatment. Thrombi were seldom observed or palpated two weeks after cessation of therapy. The extent to which this thrombolytic effect was related to trypsin per se, however, cannot be determined on the basis of observations presented in this paper. It is highly significant that the subsidence of edema, with trypsin administration, reduced mechanical obstruction of vascular channels, improved collateral circulation, and restored lymphatic drainage, thereby facilitating naturally occurring proteolytic and thrombolytic mechanisms. An enhanced proteolytic enzyme and thrombus substrate interrelation resulting in augmented thrombolysis is strongly suggested. It is noteworthy that in none of the thrombophlebitis patients treated with trypsin did pulmonary emboli develop during a follow-up of several months.

Since electrocardiographic and histological examination of rabbit and dog hearts following intravenous therapy with trypsin were negative and since side-effects were negligible, the drug was administered to patients with recent myocardial infarctions. It is significant that no untoward sign developed during the infusions or periods of observation. Since an important pathophysiological component contributing to extension of myocardial lesions is intracellular and extracellular edema, it is conceivable that trypsin-induced lysis of intracapillary and lymphatic thrombi may contribute toward reversing the accumulation of interstitial myocardial fluid, facilitating capillary blood flow, and hastening repair of the damaged myocardium. The reduction in the intracellular and extracellular myocardial edema may be decisive in preventing further occlusion of minute coronary vessels by eliminating the factor of mechanical compression. In spite of the definite improvement noted in the convalescent and acutely diseased coronary patients, further evaluation of parenterally administered trypsin must await a much larger series of patients and the results of extensive animal experiments now in progress.

Impressive results were obtained in 15 patients with acute rheumatoid arthritis and in 3 with acute rheumatic carditis.^{10a} The ideal antirheumatic agent should consistently affect fundamental systemic and tissue alterations of the disease. The brilliant investigations of Stetson¹⁰ correlate morphological changes of the rheumatic state, such as necrotizing arteriolar changes, hemorrhagic necrosis, pancarditis, and changes in interstitial fluid compartments, with the development of capillary thrombi

consisting of platelet masses and sticky leukocytes. These pathophysiological changes constitute morphological alterations of the Schwartzman and Arthus type.¹⁰ It is entirely possible that the almost immediate therapeutic response of patients with acute rheumatoid arthritis and acute rheumatic carditis to trypsin is based on lysis of intracapillary and lymphatic thrombi in areas undergoing the Schwartzman or Arthus type of tissue reaction.¹¹ Therefore, parenterally administered trypsin provides the means for suppressing and reversing this type of tissue hypersensitivity reaction. In a previous investigation we have reported observations on the anticoagulant, fibrinolytic, and thrombolytic properties of intravenously administered trypsin; thus, it seems plausible to assume that intracapillary and lymphatic "plugging" in areas undergoing hemorrhagic necrosis would be lysed by the administration of trypsin. Certainly, the almost immediate subsidence of edema after institution of this therapy in patients with acute rheumatic arthritis is compatible with restitution of lymphatic drainage, improvement in local circulatory integrity, and changes in fluid electrolyte and hydrogen ion concentration.

SUMMARY AND CONCLUSIONS

There was dramatic subsidence of all signs and symptoms of acute inflammation in 94.3% of the patients studied during this investigation. It therefore appeared likely that, in a manner as yet unexplained, trypsin activated a system of naturally occurring enzymes, which participate in determining the rate at which inflammatory processes subside, thereby enabling healing to follow. Trypsin, then, alters the host reaction to injury. Studies now in progress in our laboratory indicate that this augmented host reaction to tissue injury, initiated by trypsin, embraces such factors as (1) enhanced surface and intravascular phagocytosis, (2) increased lysis of liquefied bacteria, (3) decreased viscosity of all tissue fluids, (4) lysis of intralymphatic thrombi, (5) dissolution of fibrin barriers in areas of acute inflammation, (6) liquefaction of capillary thrombi consisting of leukocytes and platelet masses, and (7) amelioration of metabolic defects in the areas of acute inflammation, i.e., elevation of hydrogen ion concentration and inhibition of anaerobic glycolysis. There then follows restoration of "metabolic continuity" with the remainder of the organism occasioned by lysis of capillary thrombi in areas of acute inflammation. The end-result is rapid suppression and reversal of the signs and symptoms of acute inflammation. It would therefore appear that, expressed simply, the rate at which proteolytically activated biochemical reactions occur determines in large measure the subsidence rate of the acute inflammatory reaction. That trypsin apparently activates this proteolytic enzyme system seems substantiated in this investigation. From a therapeutic standpoint, then, trypsin plays a significant role in catalyzing enzymatic sequences that augment the host reduction to injury.

¹¹ Experiments now in progress indicate that trypsin suppresses the Schwartzman phenomenon in rabbits.

CLINICAL NOTES

USE OF TRYPSIN INTRAVENOUSLY IN A GUNSHOT WOUND

REPORT OF A CASE

Gerald I. Cetrulo, M.D., Newark, N.J.

The use of trypsin (Enzar) intravenously in thrombophlebitis was reported in the *Bulletin of the New York Academy of Medicine* of August, 1952. The following case report is intended to encourage clinical use of trypsin intravenously in traumatic wounds and compound fractures, especially in war wounds. The case described illustrates the potentiality of this substance as regards (1) removal of debris, (2) decrease of edema, (3) removal of slough, (4) lessening of drainage, (5) decrease in exudate, (6) anticoagulant and fibrinolytic action, (7) removal of medium for bacteria, and (8) speeding up of the entire healing process.

REPORT OF CASE

A 26-year-old white man was accidentally struck by a rifle bullet in the left arm while hunting in Maine on Oct. 26, 1952. The bullet entered the lateral aspect of the upper arm and made its exit on the medial aspect, taking a piece of skin about 3 by 2 in. (8 by 5 cm.) in size with it. The humerus was split obliquely. Fortunately, no major nerve or blood vessel was severed.

An emergency hanging cast was applied in Maine on Oct. 26, 1952. On Nov. 1 the patient was admitted to the Clara Maass Memorial Hospital in Newark, N.J. On admission the wound was draining profusely, and the arm was three times its normal size. Openings at the site of the entrance and exit wounds exposed the fractured bone. The patient had been receiving penicillin and streptomycin. This therapy was continued, and traction was instituted by means of an airplane splint and a Steinmann pin (through the ulna below the olecranon), with a clevis attached to the lateral extension of the airplane splint.

There was no improvement in the edema, slough, drainage, exudate, and necrosis for several days. The patient was treated with trypsin intravenously (50,000 units in 200 cc. of isotonic sodium chloride solution given slowly, daily). He showed no outward reaction. On the third day of intravenous trypsin therapy, the edema had subsided considerably, the drainage was moderate, the necrotic tissue had become demarcated (and was removed), and the bullet holes had begun to close. On the sixth day the edema had disappeared, the wound was clean, drainage had ceased, exudate was minimal, and the edges of the wound looked fresh and healthy.

The wound progressed to complete healing, with strong callus formation at the site of union. The traction pin was removed three weeks after insertion. Six weeks from the occurrence of the compound fracture, the arm was in excellent condition, the fracture was united, and the wounds were closed. No grafting was necessary. The splint was removed, and the arm was placed in a triangular supportive bandage without a dressing.

CONCLUSIONS

The rapidity of healing in this case can be attributed to (1) the digestive action of the trypsin, (2) the proteolytic action on necrotic tissue, (3) the denial of a medium (debris and slough) to bacteria, (4) the anticoagulant action of trypsin, and (5) the opening up of

humoral channels of supply and excretion in the devitalized area. The potential proteolytic and fibrinolytic and anticoagulant properties of trypsin unquestionably need further clinical trial. Intravenous use of trypsin in one case does not present any conclusive evidence in favor of use of this enzyme as an acceptable form of treatment of wounds. The results in this case (without any adverse reaction) are of such a nature, however, as to encourage further clinical studies of the intravenous use of purified trypsin in traumatic or infected wounds.

SEVERE PARA-AMINOSALICYLIC ACID HYPERSENSITIVITY SIMULATING MONONUCLEOSIS OR HEPATITIS

M R Lichtenstein, M D

and

W Cannemeyer, B.A., Chicago

Thousands of tuberculous patients are now using *p*-aminosalicylic acid as an adjunct in the chemotherapy of their disease. The commonest side-effect noted with this drug has been gastrointestinal irritation,¹ which occurs in about 10% of the patients. A smaller number of patients exhibit fever and a skin rash² after several weeks of therapy. A severer form of hypersensitivity to *p*-aminosalicylic acid, which may simulate mononucleosis³ or hepatitis,⁴ has recently been described in the foreign literature. One of these cases was fatal.⁵

Eight patients exhibiting this severe type of hypersensitivity to *p*-aminosalicylic acid have been encountered among approximately 3,000 patients who have taken the drug in this institution over the past few years. It is most important that the condition be recognized and therapy stopped promptly, since a mistaken diagnosis of mononucleosis or hepatitis may result in continued therapy with *p*-aminosalicylic acid, followed by greater morbidity and perhaps death.

CHARACTERISTICS OF THE REACTION

In the eight cases studied the clinical and laboratory characteristics of the reaction were as follows:

Onset—The reaction began 23 to 37 days after the start of *p*-aminosalicylic acid therapy. Fever ranged from 101 to 105 F. Chills accompanied the fever in all but

one case and were severe in two cases. The complaints of headache and generalized aching were made by half of the patients. Six patients complained of nausea, and in three of these it was accompanied by emesis. Burning of the eyes and lacrimation occurred in five patients. A skin rash developed in all cases. The rash involved the face, neck, and arms in the milder cases and was generalized in the severer ones. Usually it was erythematous and macular, but in one case it was urticarial. The pruritus was fairly severe in all but one patient. Cervical lymphadenopathy was noted in five patients. Axillary lymph nodes were also palpable in one patient and inguinal nodes in another. Hepatomegaly with tenderness and splenomegaly were noted in two patients. One of these had obvious jaundice, with a bilirubin level of 4.6 mg per 100 cc.

Laboratory Studies—The most interesting finding was the presence of atypical lymphocytes varying from 1% to 21%. These lymphocytes corresponded to those described as type 1 and type 3 by Downey⁶ or as virocytes by Leibowitz.⁷ Neutropenia, left shift, toxic granulation, relative or absolute lymphocytosis, and eosinophilia (11% to 50%) were also commonly noted. Cold agglutination tests and Paul-Bunnell reactions (repeatedly performed in each patient) were consistently negative.

Alkaline phosphatase values were above normal in three of the four cases studied (13.7 units, 21.4 units, and 52.6 units). Thymol turbidity tests were above normal in three of five cases studied (5 units, 8 units, and 19 units). Bilirubin was above normal in three of five cases studied (1.9 mg, 1.4 mg, and 4.6 mg per 100 cc). The cephalin flocculation test was 3 or 4+ in the five cases studied. The sulfobromophthalein (Bromsulphalein) test was performed in three patients, one showed 5% (normal) and the other two 15% and 20% retention.

Scratch, intradermal, patch, and passive transfer tests were performed. The most useful of these was the patch test, which was frequently positive when performed by applying a 33% ointment of *p*-aminosalicylic acid in lanolin to the intact skin for 48 hours.

Clinical Course—When administration of the drug is discontinued, the fever, rash, lacrimation, and itching subside rapidly in the course of a few hours to a few days. The blood picture reverts to its previous condition in a week or two. The sulfobromophthalein test returned to normal within a month in the two patients mentioned (15% and 20% retention). Exacerbation of symptoms, reappearance of atypical lymphocytes, increase in eosinophils, and neutrophilic left shift occur promptly if the drug is readministered even in fractional doses.

COMMENT

The sudden onset of fever with adenopathy and atypical lymphocytes suggests the possibility of infectious mononucleosis. Nausea, emesis, hepatomegaly, splenomegaly, and abnormal liver function tests strongly suggest the possibility of hepatitis. While studies are being made to verify the presence or absence of these conditions, the patient may become progressively worse if *p*-aminosalicylic acid therapy is continued. It is therefore of considerable importance that the true origin of the clinical picture should be recognized early. Fever, rash,

adenopathy, and lacrimation constitute a syndrome frequently found in drug hypersensitivity and should therefore awaken suspicion. It is necessary to know, in addition to these findings, that *p*-aminosalicylic acid hypersensitivity can cause the appearance of atypical lymphocytes and also evidence of liver damage. If the clinician is aware of these facts, he will recognize or suspect *p*-aminosalicylic acid hypersensitivity and promptly stop administration of the drug. Proof that the syndrome described is a hypersensitivity reaction is afforded by the fact that it recurs even after a long interval on readministration of very small doses of the drug.

Since the patients are almost always receiving streptomycin therapy concurrently, the reaction is frequently attributed to this drug, however, all of my patients have been able to continue taking streptomycin without difficulty after *p*-aminosalicylic acid therapy was discontinued and the reaction had subsided. Rare cases have been noted in which the hypersensitivity reaction recurs on readministration of either drug alone.¹⁶

Treatment may be attempted by the use of antihistamines. In my experience, this has not been effective enough to permit continued therapy. Desensitization, after the symptoms have subsided, has been reported successful in about 50% of the cases. My attempts have not been that successful. If tried, treatment should start with drop doses orally and increased very slowly.

p-Aminosalicylic acid is used with streptomycin mainly because it delays the emergence of resistant tubercle bacilli. Isoniazid or oxytetracycline (Terramycin) may be used as a substitute to accomplish this purpose in patients who cannot take *p*-aminosalicylic acid.

SUMMARY

A recently recognized syndrome caused by severe hypersensitivity to *p*-aminosalicylic acid is described. In addition to fever, rash, lymphadenopathy, and lacrimation, a blood picture simulating early infectious mononucleosis and evidence of liver involvement simulating hepatitis is noted in these patients. The symptoms subside promptly on withdrawal of the drug and recur if it is readministered. It is important not to mistake the syndrome for mononucleosis or hepatitis, because continued administration of the drug causes severe morbidity and may be fatal.

Liver Function Tests—Careful clinical evaluation of jaundiced patients is of great importance since blind acceptance of results of liver function tests may be misleading. The alkaline phosphatase and flocculation tests are helpful in deciding whether jaundice is hepatocellular in origin or caused by extrahepatic bile duct obstruction. Phosphatase activity of 30 or more King Armstrong units strongly suggest obstructive jaundice. Conversely, positive results of flocculation tests indicate intrinsic hepatic disease. Use of this combination provided correct diagnosis in 72% of 54 jaundiced patients at Guy's Hospital, London. In 3 cases, the results were misleading and in 12, the two tests were valueless. Alkaline phosphatase is apt to exceed 30 King Armstrong units with malignant biliary obstruction.—S. Weiss, M.D., Jaundice, *Review of Gastroenterology*, October, 1952.

ULCERATION OF THE SKIN FOLLOWING INTRAVENOUS USE OF ARTERENOL

Joseph F. Uricchio, M.D.

Daniel G. Calenda, M.D.

and

Frank B. Cutts, M.D., Providence, R. I.

Tissue necrosis and ulceration of the skin have previously been reported as complications following the use of arterenol (3, 4-dihydroxyphenylaminoethanol).¹ Recently, we had occasion to observe a patient in whom similar lesions developed after the intravenous administration of this pressor amine into the right ankle. The drug was given, in this instance, to maintain blood pressure after an intestinal resection for gangrene of the bowel secondary to mesenteric vascular occlusion.

REPORT OF A CASE

A 48-year-old white married man had had 13 previous admissions to the Rhode Island Hospital in February, 1951, he was admitted because of severe intermittent claudication. A left lumbar sympathectomy was done. At operation no pulsations were noted below the bifurcation of the aorta, and the diagnosis of osteoporosis due to trauma was made. The following month the patient was admitted because of chest

Right lower extremity showing ulceration and necrosis of tissue (a) view along the course of the long saphenous vein and (b) a more detailed view of the area of ulceration about the knee.

pain. An electrocardiogram gave evidence of acute coronary insufficiency. In March, 1951, a right lumbar sympathectomy was performed, and in June of that year a left mid thigh amputation was carried out because of symptoms and signs of marked peripheral arteriosclerosis. In September, 1952, the patient was treated for acute lateral myocardial infarction. On Dec. 5, 1952, he noted crampy pain in the midabdomen associated with vomiting and diarrhea. On examination, his temperature was 98 F, pulse 120 and irregular, and blood pressure 150/110 mm Hg. Auscultation of the heart revealed the presence of auricular fibrillation, which was confirmed by electrocardiogram. Initially the abdomen was relaxed. During the succeeding hours increased tenderness and rigidity developed in his abdomen, associated with the disappearance of peristalsis. The white blood cell count was 39,000. On Dec. 6, 1952, an ileotransverse colostomy was performed because of gangrene of the small bowel secondary to a superior mesenteric artery occlusion. During the course of the surgery, the patient was given 1 arterenol (Levophed) into the right arm, 4 mg dissolved in 1,000 cc of dextrose in water and given at the rate of 20 drops a minute. The blood pressure was maintained satisfactorily. Postoperatively, the patient was digitalized and given quindine intramuscularly. In addition, a cut was made at the right ankle and a cannula inserted. A transient bout of

1 Greenwald H. P., Gootnick A., Luger N. M. and King J. A. Tissue Necrosis Following Subcutaneous Infiltration with Nor Epinephrine. *New England J Med* 246:252 (Feb. 19) 1952. Kurland G. S. and Malach M. The Clinical Use of Nor Epinephrine in the Treatment of Shock Accompanying Myocardial Infarction and Other Conditions. *ibid* 247:383 (Sept. 11) 1952.

hypotension developed, and arterenol was infused through the plastic cannula at the rate of 20 drops a minute. This was discontinued after a total of 100 cc was given, and the blood pressure became stable. Within 24 hours ulcers and blebs began to develop along the course of the right saphenous vein (see figure). These lesions progressed and became intolerably painful. Superficial gangrene appeared, which subsequently extended to the subcutaneous tissues. On Jan 3, 1953, a right mid thigh amputation was performed.

COMMENT

Arterenol is being employed with greater frequency in the treatment of peripheral vascular collapse. One of the effects attributable to its use has been local venospasm and phlebitis. Superficial vesicular eruptions and ulceration may then develop. The process may progress to gangrene. Conservative therapy is usually successful in the management of these complications, however, in the presence of peripheral vascular disease, one may not observe complete healing. Such has been our experience in this case. While the infusion of arterenol by means of a plastic cannula may be of value in preventing local extravasation, it does not prevent the development of venospasm and tissue necrosis. It is noteworthy that in this case arterenol was administered in an upper extremity without sequelae. Thus, in the presence of occlusive vascular disease, this drug should be used with extreme caution, if at all, and should be given in one of the arms.

NEUROLOGICAL COMPLICATIONS FOLLOWING THE USE OF "EFOCAINE"

REPORT OF THREE CASES

*Sidney K. Shapiro, M.D., Minneapolis and
David D. Norman, M.D., Bethesda, Md.*

"Efocaine," a long-acting local anesthetic, a product of E. Fougera & Co., has been publicized widely and is being used freely by the medical profession. "Efocaine" is a solution containing 1% procaine, 0.25% procaine hydrochloride, and 5% butyl-*p*-aminobenzoate in a solvent composed of 2% polyethylene glycol-300, 78% propylene glycol, and water. It is preserved with the usual preservatives, 0.1% sodium metabisulfite, and phenylmercuric borate (1:25,000). Bonica¹ has recently reported his experience with the use of "efocaine" in 100 patients. In six of these patients, postinjection neuritis and pain were encountered. He does not give details as to the seriousness or duration of disability in these patients. We have recently encountered three cases in which serious neurological residuals have resulted from the use of "efocaine." The purpose of this report is to urge caution in the use of this drug.

REPORT OF CASES

CASE 1—On Sept 9, 1952, a 34-year-old white man had the apical and posterior segments of the upper lobe of his right lung resected for tuberculosis. On Oct 1, a second segmental

resection of the upper lobe of the right lung was carried out. On this occasion the patient was placed in the usual three-fourth semiprone position, with the incision being made through the previous thoracoplasty scar. The second and third ribs were removed, and a more extensive resection was carried out without incident. At the conclusion of the procedure, 1 cc of "efocaine" was deposited about the intercostal bundles in the region of the tips of the transverse processes from the second through the seventh thoracic segments. Approximately eight hours after surgery, the patient became aware of the fact that he was unable to move his legs and was numb from the nipple line down. He became incontinent of urine and feces.

On Oct 2 the neurological examination revealed the presence of transverse myelitis with a sensory level at the fourth thoracic segment. Position sense was absent in the lower extremities. Deep tendon pain was intact. There was complete paralysis of all the muscles of the right lower extremity. In the left lower extremity, there was a trace of function in the hip flexors but the remainder of the musculature was completely paralyzed. The deep reflexes in the lower extremities were hyperactive. The toe signs were negative. When the patient was reexamined four weeks later, there had been only slight improvement in his neurological status. The findings were essentially unchanged except for the slight return of function in scattered muscle groups in the left lower extremity. A minimal dorsiflexion of the right big toe was the only movement in the right lower extremity. A sustained patellar and ankle clonus had developed bilaterally. At the time of writing (Nov 29), the patient continued to be paraplegic and the urinary incontinence had persisted.

Comment—It was the opinion of the operating surgeon that, owing to the obliteration of landmarks by the previous surgery, a portion of the "efocaine" deposited at the fourth rib level had found its way intratheca. Severe transverse myelitis developed, resulting in paraplegia due to use of the "efocaine."

CASE 2—A 32-year-old white woman on Sept. 14, 1952, while in labor received a paracervical injection of "efocaine" in an effort to block the pelvic nerves bilaterally. Coincident with the injection, she noted immediate numbness of the left leg. The patient delivered uneventfully. The numbness improved somewhat but persisted from the left knee down. On Sept 19, she began to complain of sharp shooting pains and constant aching of the left lower extremity. When examined on Sept 24, she demonstrated the following positive neurological signs: There was moderate weakness of the left quadriceps hamstrings, evertors of the foot, and dorsiflexors of the ankle and toes. The left ankle was markedly swollen, and the patient reported that this swelling increased when she was on her feet for any length of time. Reddish discoloration and excessive perspiration of the dorsum of the left foot were present.

When she was last seen on Oct 29, some improvement had occurred in the patient's condition. The pain had responded to the use of priscoline® (2-benzyl 2-imidazoline), 50 mg. three times a day, and physical therapy. The swelling of the foot and ankle, while still present, was less marked. The muscle weakness demonstrated on the initial examination persisted.

Comment—The lumbosacral plexus was involved at the time of the injection of the "efocaine" in this case. This involvement resulted in toxic neuritis, which is still partially disabling to this patient.

CASE 3—A 36-year-old white man was operated on for a solitary lesion in the upper lobe of the right lung on Sept 8, 1952. The fifth rib on the right side was resected from a point just proximal to the tip of the transverse process to the mid axillary line. After the completion of the operation, 2 cc of "efocaine" was instilled in the region of the intercostal bundle at the angle of the ribs from the third to the seventh thoracic

From the division of Neurology, University of Minnesota (Dr. Shapiro), Fellow, National Institute of Neurological Diseases and Blindness (Dr. Norman).

¹ Bonica, J. J. Management of Intractable Pain with Analgesic Blocks. J. A. M. A. 150: 1581-1586 (Dec. 20) 1952.

segment Twelve hours postoperatively, the patient noted anhidrosis on the right side involving the right side of the face and body extending down to the right groin This anhidrosis was complete above the level of the umbilicus, and partial from the umbilicus to the groin This condition was still present on Nov 28

Comment—Following the use of "efocaine," evidence of involvement of the sympathetic nervous system developed and has persisted in this patient The involvement was manifested by anhidrosis on the right side

SUMMARY AND CONCLUSIONS

Three cases have been reported in which, following the use of "efocaine," serious neurological symptoms developed and persisted to the time of writing Following the use of this drug, in case 1 transverse myelitis developed, in case 2 a lumbosacral neuritis, and in case 3 involvement of the sympathetic nervous system The use of "efocaine" should be sharply restricted and cognizance taken of the potentially serious nature of the neurological complications following its use

ARACHNIDISM TREATED WITH CORTISONE

REPORT OF A CASE

Z Marenčić, M D, Pula, Yugoslavia

During recent years bites of the *Latrodectus tredecimguttatus* spider have been encountered frequently in Istria, Yugoslavia During the period 1948-1952 in the General Hospital of Pula, 101 patients were treated for this condition The persons bitten by the spider show¹ a disturbed general condition with severe pains, especially in the loins, abdomen, and extremities, convulsions, tachypnea, pressure in the chest, vomiting, excessive perspiration and salivation, and rigidity of abdominal muscles The tendon reflexes and the pressure of cerebrospinal fluid are increased, and changes in the fundus of the eye are, in some cases, marked The patients have hyperemia of the face, edema of the eyelids, and conjunctivitis, and show increased blood pressure, oliguria, albuminuria, abnormal values of urea blood concentration and urine dilution, and temporarily disordered liver metabolism In some cases some days afterward a rash appears In regard to other symptoms the local findings are relatively insignificant To a degree signs of the alarm reaction have been noted in my patients This is demonstrated by changes in the hemogram, with the appearance of leukocytosis, fall of eosinophils, neutrophilia and lymphopenia, increase in excretion of rest nitrogen, hemoconcentration, changes in the glucose curve and values of electrolytes in patients, as well as the pathological macroscopic and microscopic findings in the organs of experimental animals enlargement of the adrenals, and enlargement of the cortex with thin zona

glomerulosa and enlarged zona fasciculata and zona reticularis For these reasons cortisone therapy was used in the case herein reported

A country man from Poreč, aged 52, entered the General Hospital of Pula July 24, 1952 About 24 hours previously, when he was sleeping on the straw after threshing, he awoke because of pain radiating from the right knee into the groin Shortly afterward the pain became intense and moved to the abdomen, chest and loins He noted paresthesia and burning in his feet, especially in the soles The pains seemed to be pressing and cutting in the loins He was rather warm and felt as if he would "burst" The patient shivered, threw himself from side to side, was sweating extremely, and could not speak He did not urinate for 15 hours He vomited three times and had heartburn and highly increased salivation

The general condition was poor, and the patient could not stand on his legs A fear of death was noted Respirations were 30 per minute, superficial, and groaning The temperature was 36.7 C, pulse 84 per minute, and blood pressure 160/120 mm Hg His face was hyperemic, the conjunctivas were injected, and the eyelids and loose tissue below the eyes manifested slight edema The abdomen was slightly distended, the abdominal musculature rigid, and the liver palpable for ½ finger-breadth and sensitive to pressure On the medial side of his right knee there was a sharply limited red spot, the diameter of which was 1 cm The sensitivity to needle stings was diminished in this region The fibrillation of musculature in the right leg was marked

The abnormal laboratory findings were as follows leukocytes 12,400, eosinophils 56 per cubic millimeter, and urea nitrogen in blood 72 mg per 100 cc The white blood cell study showed slight neutrophilia and lymphopenia A thymol test and a hematocrit gave above normal results Fifteen minutes after admittance, at 3:15 p m, the patient, who weighed 58 kg, received 80 mg of cortisone (Cortone) acetate intramuscularly Twenty minutes later amelioration was noticed, the patient was quieter, did not throw himself about, and breathed easier After one hour he said that the formerly intense pain in the loins had disappeared and slight pain remained only in the abdomen Still he had disturbances in his feet According to my observations, of all the symptoms foot disturbances are most resistant to therapy and persist the longest in patients Relief became more manifest every hour At 5:30 p m the patient felt no disturbances except for slight pain in his feet Objective amelioration was also observed The patient was completely quiet, the rigidity of abdominal musculature had disappeared, the edema of the eyelids was less, and the breathing was quiet respirations were 20 per minute, and blood pressure, 120/85 mm Hg At midnight the patient had a relapse of pain, but afterward he felt well and slept Sleeplessness was observed as a constant symptom in my patients The next day the patient was well, and during the following days the laboratory and other findings returned to normal On July 26 a slight morbilliform rash appeared on his abdomen

CONCLUSIONS

Greiner² included the bites of venomous animals, such as *Latrodectus tredecimguttatus*, among diseases in which corticotropin (ACTH) and cortisone "appear to be of great value" In this case I am of the opinion that a somewhat larger dose of cortisone, and possibly two such doses, would have given a still better effect It is evident that for successful treatment of arachnidism one can also use less expensive drugs, but in severe cases or in those patients who are in danger of death cortisone possibly combined with calcium gluconate or antivenin would be of greater value In the case reported, arachnidism with manifest signs of alarm reaction was successfully treated with a single dose of 80 mg of cortisone

INSTRUMENT FOR CONTINUOUS RECORDING OF BODY TEMPERATURE

Robert M Weiss, M D

and

Charles B Ripstein, M D, Brooklyn

Artificial induction of low body temperature in patients undergoing cardiac surgery and in the treatment of hyperpyrexia has emphasized certain technical problems in clinical thermometry. The standard clinical thermometer, although adequate for the majority of studies, is not well suited to the newer methods for the production and maintenance of the hypothermic state. There are difficulties involved in reading the body temperature during surgical procedures and in the management of neurosurgical patients who require careful temperature control. The ideal instrument for these pur-

Fig. 1—The continuous recording thermometer

poses should possess certain qualifications. It should be highly accurate and simple to operate and interpret, and it should give a continuous record. In addition, it should be rugged and portable for use in the operating room and on the ward. We believe that the instrument described in this paper fulfills these specifications and represents a distinct advance in clinical thermometry. Previous attempts to produce such an apparatus have been conducted along the lines of thermocouple-galvanometer combinations with direct reading scales.¹ While such units possess a high degree of accuracy, they do not give a continuous record, and they require the personal attention of the observer to balance the galvanometer for each reading.

From the Department of Surgery, Maimonides Hospital, and New York University College of Medicine, New York.

1. Bigler J A. and McQuiston W O. Body Temperatures During Anesthesia in Infants and Children. J A M A 146: 551 (June 6) 1951.

2. The thermometer described is manufactured by the Weisker Thermometer Corporation, 52 W. Houston St., New York.

The instrument we have devised (fig 1 and 2) is an adaptation of a standard industrial, liquid-actuated, clock-motor-driven, recording thermometer.² The sensing unit is a specially designed stainless steel bulb on a narrow stem, which can be inserted into the rectum without discomfort to the patient. This is connected to the

Fig. 2—Interior of continuous temperature recorder

recording thermometer by a plastic-covered, stainless steel, capillary tube 6 ft long. Self-contained batteries supply power for electrical contacts set at 103 F and 80 F so that warning lights are switched on automatically at these temperatures. The chart used (fig 3) has a scale range of 70 to 110 F, which is marked off in 0.5 F divisions and can be read to within 0.25 F. It gives a continuous 12 hour record, with 10 minute and hourly divisions.

For use, the instrument is wound up, the rectal insert is placed in position, and the inked pen is released. The unit requires no attention. Signal lights give warning if the temperature reaches the critical levels of 103 F and 80 F.

Fig. 3—Segment of temperature chart showing time and temperature graduations

We have used this unit on patients undergoing neurosurgical procedures, patients with pyrexia on a septic basis, and patients being made hypothermic for cardiac surgery. The results have been uniformly satisfactory.

4802 10th Ave (19) (Dr Ripstein)

COUNCIL ON PHARMACY AND CHEMISTRY

NEW AND NONOFFICIAL REMEDIES

The following additional article has been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

R T STORMONT, M D, Secretary

Zincasate Burn Dressing—Zinax Burn Dressing (Hynson, Westcott & Dunning)—Zincasate burn dressing consists of zincasate gel, a partially hydrolyzed casein gel, and zincasate gauze, a zinc acetate impregnated gauze.

Actions and Uses—Zincasate, a combination of partially hydrolyzed casein gel and zinc acetate impregnated gauze to be applied separately, is used as a dressing for the local treatment of burns by the closed pressure bandage technique. The gel, first applied over the injured area, is converted promptly into an insoluble coagulum at the point of contact with the zinc acetate impregnated gauze to form an adherent, protective, semipermeable membrane that permits the evaporation of water while reducing the loss of transudates. The gel will set eventually without the aid of zinc acetate gauze, so that the layer next to the wound is not immediately coagulated. The gauze, through its union with the adherent gel, provides some pressure and a surface to which an elastic bandage can be applied to increase pressure where this is feasible. The combined use of these materials should follow the same general principle and aseptic technique applicable to the use of petrolatum and plain gauze. The use of a coagulable protein and zinc acetate gauze has the slight advantage of convenience of application, avoidance of maceration, less need for redressing, and production of a pliable protective film permitting easier movement and transport of the patient.

Dosage—Zincasate gel and gauze dressing are applied after removal of obvious dirt or necrotic tissue, with sterile technique, but without surgical débridement. The casein gel should be applied to superficial as well as to more deeply injured areas to a thickness of not less than $\frac{1}{8}$ in (0.3 cm) and should extend beyond the borders of such areas. This is then covered with strips of the zinc acetate impregnated gauze, over which a pressure bandage is applied. Alternatively, the gel may be applied to the gauze, which is then placed over the injured area with the gel side in apposition to the wound. In first degree burns or burns that exhibit only erythema the dressing is usually removed the following day. In superficial second degree burns, the dressing may be left intact until healing occurs. At that time the dressing will readily drop away from the wound. Earlier removal can be accomplished by soaking the dressing with warm isotonic sodium chloride solution. In deep second and third degree burns, where grafting may be necessary, the surface is frequently ready for grafting within 9 to 12 days. In such cases it is advantageous to hasten removal of necrotic tissue by redressing once during this period. In severe burns, the gel film separates readily after the dead skin becomes lysed. It is not necessary to use occlusive bandages on the hands, arms, or face or in other areas where this is not feasible. Gauze is applied longitudinally to the extremities, rather than encircling the limb, to avoid abnormal constriction or pressure at vulnerable points. For small or facial burns, the gel and gauze may be applied as a patch without elastic bandage.

Tests and Standards—

ZINCASATE GAUZE. Assay (Zinc) Transfer to a porcelain crucible an amount of zincasate gauze accurately weighed containing the equivalent of about 0.3 gm of zinc acetate. Add 5 ml of nitric acid and heat to dryness on a steam bath and then ignite. Cool the crucible and contents. Dissolve the residue in about 5 ml of diluted hydrochloric acid. Filter the

solution and wash both crucible and filter paper with hot water. Bring the clear solution to a volume of about 50.75 ml and add enough sodium carbonate T.S. dropwise to precipitate all the zinc as the carbonate. Avoid a large excess of sodium carbonate. Boil the reaction mixture for 5 min., cool and filter through a tared Gooch crucible. Wash the precipitate thoroughly with hot water until the washings are no longer alkaline. Dry ignitely at 500° for 1 hour, cool and weigh. Each gram of zinc oxide formed is equivalent to 2.254 gm of anhydrous zinc acetate. The amount of zinc acetate is not less than 25.0 nor more than 35.0%.

ZINCASATE GEL. Physical Properties Zincasate gel is a pinkish tan viscous liquid with viscosity between 8×10^4 and 14×10^4 centipoises as determined with the Brookfield viscosimeter. The gel has a pH of 6.5-7.0. It is readily coagulated by zinc acetate.

Purity Tests Transfer to a tared platinum crucible about 5 gm of zincasate gel accurately weighed and dry at 105° for 10 hours. The amount of residue which remains is not less than 20.0 nor more than 22.0%. Save the residue for the ash determination.

Char the residue from the total solids determination ignitely until all the carbon has been removed, cool and weigh. The amount of residue is not less than 2.7 nor more than 3.7%.

Assay (Nitrogen) Transfer to a Kjeldahl flask about 0.1 gm of zincasate gel and determine the nitrogen by the U.S.P. semi-micro Kjeldahl method. Each milliliter of 0.01 N acid is equivalent to 0.0001401 gm of nitrogen. The amount of nitrogen is not less than 2.25 nor more than 2.45%.

(Amino Nitrogen) Transfer to a 250 ml beaker about 10 gm of zincasate gel accurately weighed, add about 75 ml of water and stir until solution is complete. Add 10 ml of neutralized 37% formaldehyde mix well and electrometrically titrate the solution with 0.1 N sodium hydroxide. Each milliliter of 0.1 N sodium hydroxide is equivalent to 0.001401 gm of nitrogen. The amount of amino nitrogen is not less than 0.18 nor more than 0.20%.

For tests and standards on Zinc Acetate N.N.R., see the monograph for this material.

Zinc Acetate— $C_4H_6O_2 \cdot Zn \cdot 2H_2O$ —M.W. 219.50—The structural formula of zinc acetate may be represented as follows.

Tests and Standards—

Physical Properties Zinc acetate is a white crystalline solid having a pearly luster and a very faint acetic acid odor upon exposure to air. The crystals gradually effloresce. It is freely soluble in water and soluble in alcohol. The pH of a 1% solution is 5.5-7.0.

Identity Tests Dissolve about 0.1 gm. of zinc acetate in 5 ml. of water, add 0.5 ml of sulfuric acid and heat. A strong odor of acetic acid is noticeable (presence of acetate group).

Dissolve about 0.1 gm of zinc acetate in 15 ml of water and pass hydrogen sulfide through the solution. A white precipitate forms that is insoluble in acetic acid but is soluble in diluted hydrochloric acid (presence of zinc).

Purity Tests Transfer to a 100 ml volumetric flask 1 gm of zinc acetate accurately weighed, add 75 ml of water and shake until solution is complete. Add enough ammonium sulfide T.S. to precipitate the zinc completely, fill to the mark with water, mix and filter. Transfer to a porcelain evaporating dish 50 ml of the clear filtrate, add 5 drops of sulfuric acid, evaporate to dryness and ignite to constant weight. The weight of the residue does not exceed 5 mg. (presence of alkalis and earths).

Dissolve 0.2 gm of zinc acetate in 5 ml of water and run a U.S.P. arsenic test. The amount of arsenic does not exceed 10 ppm.

Dissolve 0.5 gm. of zinc acetate in 7 ml. of water and transfer the solution to one of a pair of matched Nessler tubes. Add 10 ml of 10% potassium cyanide, mix well and allow the mixture to become clear. Prepare a standard by placing in the other Nessler tube 5 ml. of water, 2.5 ml of U.S.P. standard lead solution and 10 ml of 10% potassium cyanide. To each of the solutions add 0.1 ml of sodium sulfide T.S. mix the contents and allow the tubes to stand for 5 min. The color produced in the sample is not greater than that produced in the standard indicating not more than 50 ppm of heavy metals.

Assay (Zinc Acetate) Transfer to a 250 ml beaker about 1 gm of zinc acetate accurately weighed and add 100 ml of water. Heat the solution to about 90° and add sodium carbonate T.S., dropwise to precipitate all of the zinc. Avoid a large excess of sodium carbonate. Boil the mixture for about 5 min and set it aside to allow the precipitate to settle. Collect the precipitate in a tared Gooch crucible and wash with hot water until the washings are free from alkali. Dry the residue, ignite and weigh. Each gram of zinc oxide is equivalent to 2.254 gm of anhydrous zinc acetate. The amount of anhydrous zinc acetate is not less than 82.7 nor more than 87.3% equivalent to not less than 99.0 nor more than 104.5% of the dihydrate.

Hynson, Westcott & Dunning, Inc., Baltimore, Md

Zinax Burn Dressing 8.18 cc tubes of zincasate gel packaged with 10 gauze pads and 118.3 cc cans of zincasate gel packaged with 2 yards of gauze. The gauze is impregnated with approximately 30% zinc acetate by weight. U.S. patent 2,579,367.

POSTGRADUATE CONTINUATION COURSES FOR PHYSICIANS

The semiannual listing of postgraduate continuation courses prepared by the Council on Medical Education and Hospitals appears elsewhere in this issue (page 629). Opportunities for this type of postgraduate education are presented for the six month period beginning July 1. There are a total of 784 courses listed, 418 being offered on a full-time basis and 366 on a part-time schedule. The courses vary in length from a few days to several months. For this six month period, postgraduate education in some form is being given in 37 states, the District of Columbia, and Puerto Rico. The subjects include 34 major areas in the field of clinical medicine and 9 basic science subjects. There are learning opportunities for the physician in general practice as well as the specialist. Many courses are designed to be of assistance to physicians preparing for specialty board certification. The courses available for this purpose are designated by a footnote. A series of courses for military personnel at medical installations is also included. In a number of instances the series of courses for military personnel are made available to civilian physicians. This is also designated by a footnote.

A total of 134 agencies offer postgraduate training in this listing, including 43 medical schools, 35 special medical societies, 18 hospitals, 12 academies of general practice, 11 state medical societies, 6 graduate schools of medicine, and 3 agencies, representing boards of health, schools of public health, and government departments, respectively.

The Council tries to make this listing as complete as possible. Institutions and organizations whose courses are not included in the list are invited to furnish the Council with details pertaining to the opportunities that have been developed for continuation study for physicians.

In addition to the compilation of this semiannual list of postgraduate courses, the Council is engaged in a field study of postgraduate education. A member of the Council's staff has spent the last six months contacting those responsible for such training and collecting facts, figures, and opinions. All sections of the country will have been visited by the summer of 1953. The Council plans to prepare a comprehensive report of its findings.

VIRAL HEPATITIS

The widespread use of blood and blood products during World War II led to the recognition of serum hepatitis as a complication of parenteral injections. In the years that followed, considerable controversy arose as to whether this condition was a disease distinct from infectious (epidemic) hepatitis. In a recent article Stokes¹ has summarized succinctly the evidence favoring the viewpoint that infectious hepatitis (hepatitis A) and serum hepatitis (hepatitis B) are different entities despite their essentially identical clinical manifestations. In his discussion Dr. Stokes draws widely on his own observations of both natural infections and experimentally induced infections in human volunteers.

First, experiments with volunteers and observations under natural conditions have yielded convincing evidence of a lack of cross immunity between the two viruses, thus indicating antigenic differences. Again, Red Cross gamma globulin has been shown repeatedly to give a high degree of protection against infectious hepatitis. On the other hand, with but one known exception, it has proved ineffective against natural or experimentally induced serum hepatitis and in neutralizing virus B. Even gamma globulin prepared from volunteers convalescent from hepatitis A failed to neutralize virus B. Furthermore, convalescent plasma from one such patient failed to neutralize virus B or protect against hepatitis B, thus tending to rule out the possibility that antibodies might be present in a fraction of the globulin other than the gamma fraction.

Another distinguishing feature of the two infections is the presence of the virus in the stools of patients with hepatitis A and the ease with which the disease may be spread by direct contact or by milk, food, or water that contains the virus. On the other hand, Stokes and his associates were unable to produce serum hepatitis by parenteral injection of stool filtrates, which could explain the lack of epidemics of hepatitis B. Again, while the incubation periods of both diseases may be lengthened by low titer or by attenuation of the virus, the mean incubation periods in volunteers and in natural infections will average 20 to 30 days with hepatitis A and 60 to 90 days with hepatitis B. Yet another difference between the two lies in the fact that hepatitis A rarely affects older persons, suggesting that permanent immunity to the disease may develop. There is, however, a high incidence of hepatitis B in older patients, suggesting that this either causes disease infrequently or does not cause complete immunity. The latter view is supported by the fact that in at least five of nine volunteers who had had hepatitis B there were transient mild symptoms.

1 Stokes J., Jr. Viral Hepatitis. *Am J M Sc* 225:349 1953.

2 Neefe J. R., Gellis S. S., and Stokes J. Jr. Homologous Serum Hepatitis and Infectious (Epidemic) Hepatitis. Studies in Volunteers Bearing on Immunological and Other Characteristics of the Etiological Agents. *J Med* 1 3 1946.

and/or laboratory findings suggestive of mild hepatic disturbance when these persons were tested later with the same virus²

Dr Stokes mentions two other possible differences between hepatitis A and hepatitis B now under active investigation. In the first place, such data as are available suggest that there is a distinctly higher incidence of carriers of hepatitis B than of hepatitis A. In the second place, a skin test for virus A has proved in preliminary tests to be 80 to 95% accurate for detecting persons previously exposed to virus A. In persons known to have had hepatitis B, positive reactions to the test occur in the same percentage as in a random sample of population of the same age range, thus apparently indicating immunity from unrecognized prior infection.

From the evidence presented it appears reasonable to conclude that there is an antigenic distinction between virus hepatitis A and virus hepatitis B and that the differences between the two are apparently greater than mere strain differences, in view of the lack of immunity and of serum antibodies in the older groups of the population to hepatitis virus B. Furthermore, the skin test has provided evidence that hepatitis virus A may be a simple antigenic entity to which one attack gives immunity and for which antibodies remain in the blood during life in appreciable quantities. On the other hand, there is little evidence at present regarding the unity or multiplicity of antigenic types in viral hepatitis B.

REGISTRATION UNDER THE HARRISON NARCOTIC ACT

Physicians who are registered under the Harrison Narcotic Act or under the Marihuana Tax Act must effect reregistration on or before July 1 to avoid a penalty. Each year, despite the annual warnings in THE JOURNAL, this requirement is overlooked by some physicians, and unpleasant consequences follow. Failure to register adds a penalty of 25% to the tax payable and, in addition, subjects the physician to the possibility of a fine not exceeding \$2,000 or to imprisonment for a maximum of five years, or to both. The Commissioner of Internal Revenue has in past years given some tardy registrants the choice of paying sums by way of compromise, a procedure authorized by law, or accepting criminal prosecution. If this procedure does not produce

the required promptness in reregistration, the commissioner will have no choice but to institute criminal prosecution.

DR WALTER B MARTIN— THE PRESIDENT-ELECT

On June 4 Dr Walter B. Martin of Norfolk, Va., became President-Elect of the American Medical Association. His election by the House of Delegates at its 102nd annual session in New York came in recognition of his many years of outstanding service to the medical profession. In the past 35 years, while conducting an active and successful practice in internal medicine, he has served as member of the Board of Trustees and House of Delegates of the American Medical Association, member of the Association's Council on Medical Service, Committee on Legislation, and Coordinating Committee for the National Educational Campaign against socialized medicine, chairman of a committee for the study of the National Health Service in Great Britain, president of the Norfolk County Medical Society, the Medical Society of Virginia, and the Seaboard Medical Association, vice-president of the Tri-States Medical Association of the Carolinas and Virginia, and member of the Southern Medical Association. During this time he has also rendered distinguished service to the U. S. Army and to his community.

Dr Martin was born in Pulaski, Va., in 1888. He re-

ceived a B.S. degree from the Virginia Polytechnic Institute in 1909 and taught chemistry and mathematics at Norfolk Academy from 1910 to 1912. In 1912 he entered Johns Hopkins University School of Medicine and received his M.D. degree in 1916. After completing a year as resident house officer at Johns Hopkins Hospital, he was commissioned lieutenant and then captain in the U. S. Army Medical Corps, where he served as assistant division surgeon, 4th Division, and assistant chief of the medical service at Fort Sheridan General Hospital during World War I. In 1919 he began the practice of internal medicine in Norfolk, Va. There he became chief of the medical service at St. Vincent De Paul Hospital, attending physician in medicine at Norfolk General Hospital, and attending specialist in internal medicine at the U. S. Public Health Service Hospital. From 1942 to 1944 he served as lieutenant colonel in the Army Medical Corps, first at Walter Reed Hospital and then as chief of the

WALTER B. MARTIN, M.D.

PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

medical service at Percy Jones Hospital, Battle Creek, Mich. In 1944 he became medical consultant to the 5th Service Command and later medical consultant to the 10th Army in the Pacific theater. In 1946, after his discharge from the Army, he was made civilian medical consultant to the Surgeon General of the Army.

Dr. Martin is a diplomate of the American Board of Internal Medicine, a fellow of the American College of Physicians and member of its board of regents, a member of the American Society for the Study of Allergy, the American Rheumatism Association, the American Clinical and Climatological Association, and the Association for the Study of Internal Secretions, and an associate member of the American Society for Clinical Pathologists. He is a member of Phi Beta Kappa, Alpha Omega Alpha, and Nu Sigma Nu fraternities.

DR ALFRED BLALOCK AWARDED DISTINGUISHED SERVICE MEDAL

At its 102nd annual session in New York, June 1, the House of Delegates of the American Medical Association awarded its highest scientific honor, the Distinguished Service Medal, to Dr. Alfred Blalock of Baltimore for his outstanding work in vascular surgery, especially for his part in the development of the "blue baby operation." This operation, first performed in 1944, has since saved the lives of hundreds of infants with congenital pulmonary stenosis. For this and his many other contributions to surgical science, Dr. Blalock has gained international recognition and an impressive list of honors.

Dr. Blalock was born in 1899 at Culloden, Ga. He received his M.D. degree from Johns Hopkins University in 1922. After serving as intern and resident at Johns Hopkins and at Vanderbilt University Hospital, he became a member of the faculty at the latter institution, where he was active in laboratory and clinical research. In 1940 he published his book "Principles of Surgical Care: Shock and Other Problems" and in the same year was awarded the research medal of the Southern Medical Association for his work on circulatory dynamics in shock. In 1941 he returned to Johns Hopkins University School of Medicine as professor of surgery, director of the department of surgery, and surgeon-in-chief of the Johns Hopkins Hospital. In 1948 he received jointly with Helen Taussig the Passano Foundation Award for the development of the "blue baby operation"; in 1949 he received the Rene Lenche Award, and in 1950 the

Rudolph Matas Award in vascular surgery. The University of Rochester awarded him an honorary doctor of science degree in 1951. In recognition of his work, a number of foreign societies have honored Dr. Blalock. He has been made honorary fellow of the Royal College of Surgeons of England, honorary associate consultant surgeon to Guy's Hospital, London, Chevalier of the Legion of Honor of France, honorary fellow of the Greek Surgical Association, and honorary member of the British Cardiac Society, the Sociedade Brasileira de Cardiologia, and the Society of Thoracic Surgeons of Great Britain and Ireland. He is a foreign member of the Belgian Society of Surgery and the Colegio Brasileiro de Cirurgicoes, and foreign associate of the Académie de Chirurgie of France.

Dr. Blalock's contributions in the field of experimental medicine have earned for him membership in the National Academy of Sciences and the National Research Council. He is also a member of the American Association for the Advancement of Science and the American Society for Clinical Investigation, a consultant on experimental medicine to the Medical Memorial Fund, and a member of the advisory council of the Life Insurance Medical Research Fund. He has been a leader in many national surgical organizations. He is a member of the founders group of the American Board of Surgery and of the Board of Thoracic Surgery, a member of the board of regents of the American College of Surgeons, a past president of the American Association of Thoracic Surgery, and a member of the council of the Southern Surgical

ALFRED BLALOCK, M.D.
AWARDED DISTINGUISHED SERVICE MEDAL

Association. He is also a member of the International Society of Surgery, the American Surgical Association, the Society of Clinical Surgery, the Society of University Surgeons, the Society of Vascular Surgery, the Southern Medical Association, and the American Medical Association. In addition, Dr. Blalock has rendered valuable service on the editorial boards of a number of medical journals. He has served as associate editor of *Surgery* since 1936, member of the consulting editorial board of *Surgery, Gynecology and Obstetrics* since 1942, member of the editorial board of the *Archives of Surgery* since 1939 and the *American Heart Journal* since 1945, member of the advisory editorial board of the *Journal of Thoracic Surgery* since 1946, and member of the editorial committee of the *American Review of Medicine* since 1948. To these and other journals he has contributed many important original articles on shock, hypertension, heart disease, and other subjects.

MEDICAL NEWS

ARKANSAS

Clinical Assembly—The Alumni Association of the University of Arkansas School of Medicine, Little Rock, is inaugurating a clinical assembly in conjunction with graduation, June 14-15. Alumni guest speakers will include Drs James W McLaurin, Baton Rouge, La., Horace C Jones, Grand Rapids, Mich., and Louis L. Friedman, Birmingham, Ala. A portion of the session will be presented by the medical school faculty. Monday afternoon there will be a symposium on "Recent Trends in Diagnosis and Treatment." The clinical session will be followed by an organization meeting of the alumni association, with Dr Eugene H. Crawley acting as chairman. All alumni of the University of Arkansas School of Medicine and physicians practicing within the state of Arkansas are cordially invited.

CALIFORNIA

Dr Pottenger Honored—At its annual meeting in Atlantic City, N. J., the American College of Physicians bestowed on Dr Francis M. Pottenger, Monrovia, its highest award, the certificate of "Master." Dr Pottenger, who has served as president of the Los Angeles County Medical Association, is the author of many papers and books on tuberculosis.

Children's Hospital—The new \$1,500,000 three story Michael J. Connel Clinic was recently dedicated at Children's Hospital in Los Angeles. It houses 38 clinics capable of serving 350 child outpatients a day. Children's Hospital has received an \$875,475 bequest in the form of a trust fund to be known as the Ernest H. and Dora H. Parker Fund for Medical and Surgical Research.

Society News—The California Medical Association announces that members who continue to use a method of cancer treatment after being warned that it is valueless will be subjected to censure, suspension, or expulsion from their medical groups. The action followed approval by the association's nine man cancer commission of a 22 page report on the first of a group of products to be evaluated in a full scale investigation of unproved cancer treatments. The report stated that "no objective evidence was found indicating control of cancer under treatment with this substance alone," and that the product proved "ineffective in three independent studies on laboratory animals." Dr Ian MacDonald, associate professor of surgery at the University of Southern California School of Medicine, Los Angeles, is chairman of the commission.

COLORADO

Pediatric Clinics in Denver—The fifth annual summer clinics of the Denver Children's Hospital, which will meet June 24-26 at the hospital, 19th Avenue at Downing Street, will have as guest speakers Drs Eugene T. McEnery, Chicago, Hattie E. Alexander, New York, and William T. Mustard, Toronto, Canada. The program will include two hour clinics on the diagnosis and treatment of infectious, cardiac, orthopedic, hematological, and chemical disorders in pediatric medicine and surgery. Luncheon, served each day in the hospital, will be followed by a question and answer period. Requests for registration should be addressed to the Chairman of the Summer Clinics, Children's Hospital, Denver 18, together with \$5 to apply on the \$25 fee.

CONNECTICUT

Fifty Year Club—The following physicians in the Connecticut State Medical Society were presented with awards and service pins during the annual dinner at the Waverly Inn, Cheshire: Richard F. Rand, Hamden, C. Brewster Brainard, West Hart-

ford, George H. Warner, Bridgeport, Robert Hazen, Thomaston, Frederick B. Braden, Essex, and Arthur A. Chase, Plainfield.

Emergency Call Plan—A full scale emergency medical call plan to serve residents of New Haven and adjoining communities has been announced by the New Haven Medical Association. The emergency panel comprises 70 physicians in general practice and 88 specialists. Communities covered by the service include East Haven, North Haven, West Haven, Hamden, Branford, Orange, and Woodbridge. The emergency service, organized by a special committee of the association headed by Dr Samuel Spinner, represents more than four months of surveys and planning, during which questionnaires were mailed to 415 physicians. The New Haven plan is the 15th emergency service to be sponsored by county and local medical associations in Connecticut, thus making emergency medical services available to an estimated 70% of the state's 2 million residents.

FLORIDA

Seminar on Gastroenterology—Dr H. Marvin Pollard, professor of internal medicine, University of Michigan Medical School, Ann Arbor, will conduct a seminar on gastroenterology at George Washington Hotel, Jacksonville, June 18-20.

Graduate Short Course—The 21st annual graduate short course for doctors of medicine will be held at the George Washington Hotel, Jacksonville, June 22-27. The faculty will include Drs Thomas M. Durant and Julius L. Wilson, Philadelphia, Robert E. Cooke, New Haven, Conn., M. Edward Davis, Chicago, Kenneth W. Warren, Boston, and Conrad G. Collins, New Orleans.

GEORGIA

Fraternity Lectureship—Phi Delta Epsilon fraternity of the Medical College of Georgia, Augusta, recently presented its annual lectureship, with Dr Isadore Snapper, Chicago, as guest lecturer, speaking on "Metabolic Bone Diseases."

Narcotic Violation—Dr Jarrell M. Estes, Abbeville, was convicted in the U. S. District Court of violating the federal narcotic law and on Jan. 22 was sentenced to serve a term of 24 months.

ILLINOIS

Hospital News—The Chicago Hospital Council reports that Chicago area hospitals spent nearly 21 million dollars in the last year on construction and improvements. Most of it was used to expand 'preventive' medical programs, which sought 'to reduce the need for inpatient bed space by improving methods of keeping people healthy before they require hospitalization.' At least 12 hospitals installed special flooring and purchased special shoes for operating room personnel to eliminate the danger of explosions caused by static electricity, and 5 general hospitals added or planned for psychiatric units. Chicago area hospitals are reported to have had more than 700,000 outpatient visits during the last fiscal year. St. Luke's Hospital has opened a campaign to raise \$1,500,000 for a medical service building that will consolidate facilities of the hospital and make additional beds available in the present buildings.

Chicago

Gift to Medical School—The Chicago Medical School Faculty Wives Association has presented to the school a check for \$8,000, the proceeds of a recent recital sponsored by the association.

Society News—At its annual meeting the Chicago Society of Internal Medicine elected the following officers: president, Dr Richard B. Capps, vice president, Dr Arthur R. Colwell, Evanston, Ill., and secretary treasurer, Dr Edwin N. Irons.

Physicians are invited to send to this department items of news of general interest for example those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

—At the annual meeting of the Chicago Urological Society the following officers were elected president, Dr Andrew McNally, vice president, Dr John W Ferrin, and secretary-treasurer Dr Joseph H Kiefer

Research Professional Services Building at Mount Sinai—Mount Sinai Hospital Medical Center recently dedicated an 11 story research and professional services building on West 15th Street and California Avenue, erected and furnished at a cost of about \$3,400,000, provided by the building funds of the Jewish Federation of Chicago, the Board of Directors of Mount Sinai Hospital, the medical staff, and various auxiliaries. The building has eight specialized laboratory divisions, six major operating rooms, and several minor operating rooms and first-aid stations. The professional services facilities of the hospital are available to any physician in the Midwest, whether or not he is a staff member of Mount Sinai Hospital. Physicians may refer patients to the facilities of the hospital for complete work up, laboratory tests, or other diagnostic tests by full time hospital scientists (at a moderate fee), results of examinations and laboratory tests will be sent to the patient's physician, thus avoiding need of hospitalization for observation and releasing beds for acutely sick patients. Much of the work done at Mount Sinai Hospital is of a philanthropic nature, one of every three cancer patients, for example, being treated at no cost or at a greatly reduced fee. Dr Stephen E Manheimer is executive director of the hospital.

Mount Sinai Research Laboratories and Professional Services Building

KANSAS

Society News—The Kansas Psychiatric Society recently elected Dr William Rottersman, Topeka, president, and Dr Robert C Anderson, Topeka, vice president, and reelected Dr John R Adams, Topeka, as secretary treasurer.

Symposium on Chest Disease—A symposium on diseases of the chest will be held at the State Sanatorium for Tuberculosis, Norton, 1 30 p m June 14, under the auspices of the Northwest Kansas Medical Society. Dr Carl W Tempel, Fitzsimons Army Hospital, Denver, will conduct the symposium. Mr Olaf Soward, Topeka, will speak on "What the Public Thinks of the Medical Profession."

Dr Thacher Honored—The town of Waterville recently held a program in honor of Dr George I Thacher, who has served nearly 30 years on the board of education, was a commissioner 20 years and has been mayor. Appointed to the Kansas State Board of Health in 1925, he was elected president of that group in 1936 and served in that capacity for 15 years until his resignation from the board in April, 1951. Dr Thacher entered the Army as a first lieutenant in 1917, emerged in 1919 with the rank of major and after World War I rose in the Army reserve to the rank of lieutenant colonel. At 76 he is still active in practice.

MICHIGAN

Meeting of Upper Peninsula Society—The Upper Peninsula Medical Society will hold its annual meeting June 19 20 in Escanaba. Out-of-state speakers include Drs John L Emmett, Rochester, Minn., Leslie W Freeman, Indianapolis, Robert S Baldwin, Marshfield, Wis., Lowell D Snorf, Evanston, Ill., Carl Davis Jr and Francis E Seneear, Chicago, and Jack A. Klieger and John Steele, Milwaukee.

Personal—Dr C Dale Barrett Jr has been appointed director of the maternal, child, and school health division of the Detroit Department of Health to succeed Dr Garner M Byington, who retired. Dr Barrett, who came to the department of health in 1949, was previously affiliated with the Ottawa County Health Department, Grand Haven.—Dr Jerome W Conn, professor of medicine, University of Michigan Medical School, Ann Arbor, recently delivered the Arthur S Loevenhart Lecture on "Endocrine Regulation of the Blood Sugar, with Particular Reference to Diabetes Mellitus" for Phi Delta Epsilon of the University of Wisconsin Medical School, Madison.—Dr William C Behen, Lansing, has returned after an expedition of about five months, during which he served at eye clinics in Shikarpur, Pakistan, Patna, India, and Barcelona, Spain.

NEW YORK

Dr Brumfield Appointed to Medical Faculty—Dr William A Brumfield Jr, Albany, first deputy state commissioner of health, has been appointed professor of public health and preventive medicine at State University College of Medicine, Syracuse, where he is expected to assume his new duties about Sept 1. Dr Brumfield has been affiliated with Indiana University School of Medicine, Indianapolis, the University of Virginia Hospital, Charlottesville, and, since June, 1935, the New York State Department of Health, returning to it with the rank of colonel after four years in the Army Medical Corps during World War II.

Hospital News—Dr Bjorn Vestergaard, Danish psychiatrist, has been appointed to the staff of a special research project in progress at Rockland State Hospital, Orangeburg. His work will be particularly concerned with the relationship of hormones to mental disease. Since October, 1949, Dr Vestergaard has served as director of biochemical research at Sct Hans Hospital Ved Roskilde, Denmark, where he conducted biochemical and endocrinological investigations on psychiatric patients. He is the author of scientific papers on this period of his research, published both in Danish and in English.—Dr Henry S Martin, immediate past president of the Eighth District Branch of the New York State Medical Society, who has served for nearly 20 years as chief surgeon of the Wyoming County Community Hospital, Warsaw, has been appointed chief of staff emeritus following his resignation from the full-time staff. Dr George W Nairn, head of the hospital's eye, ear, nose, and throat department, has been named surgeon-in-chief, and Dr Paul A. Burgeson will occupy, as acting chief of staff, the other office vacated by Dr Martin.

New York City

Award to Dr Papanicolaou—The Leonard A. Wien Award for Outstanding Research in Cancer Cytology was awarded to Dr George N Papanicolaou, professor of anatomy at Cornell University Medical College, during the annual seminar and conference on cancer cytology conducted by the Dade County Cancer Institute in Miami. The award of \$1,000, accompanied by a medal, was established by Dr Leonard A Wien of Miami, now serving his second year as president of the institute.

Plaque Dedicated to Dr Munger—Alumni and faculty of Columbia University's School of Public Health have dedicated a plaque in the school library at the Columbia Presbyterian Medical Center to the late Dr Claude W Munger, professor of hospital administration at the school, 1945-1950. Among the speakers were Dr Harry S Mustard, former New York City Health Commissioner, and Dr E Dwight Barnett, director

of the Institute of Administrative Medicine, Columbia University Dr Munger, who died in 1950, in addition to his teaching duties as a member of the faculty of Columbia University College of Physicians and Surgeons was director of St Luke's Hospital for 11 years and president of the American Hospital Association in 1936 and 1937

Personal—On their recent tour, Dr Ralph Colp, clinical professor of surgery, and Dr William M Hitzig, assistant clinical professor of medicine, Columbia University College of Physicians and Surgeons, lectured and made rounds at the General Hospital of the University of Malaya Medical School Dr Colp spoke on "Recent Methods in the Surgical Management of Gastric and Duodenal Ulcer," and Dr Hitzig on "Medicine at the Crossroads" Both men were guests at Singapore of Mr Mekie, professor of surgery, and Prof Ransome, professor of medicine, University of Malaya Medical School Drs Colp and Hitzig made observations on police medicine, as part of a far eastern survey that took them to China, Thailand, Cambodia, Viet-Nam, and India before their departure for England

NORTH CAROLINA

Postgraduate Course at Durham—The Duke University School of Medicine, Durham, offers a postgraduate course June 22-25 at Duke Hospital (registration fee, \$25) Monday and Tuesday will be devoted to anesthesia, with round table discussions at 8 p m The Wednesday program will include liver diseases, allergic diseases, and intravenous alimentation, and on Thursday neoplasms and head injuries will be discussed Ward rounds and clinic visits will be held Wednesday and Thursday Guest lecturers will be Drs Howard M Ausherman, chief of anesthesia, VA Hospital, Durham, and David A Davis, professor of anesthesiology, University of North Carolina School of Medicine, Chapel Hill Other lecturers will be from the staff of Duke University School of Medicine The faculty of the medical school will give a barbecue for all participants of the course Wednesday, 6 30 p m For information, address Director of Postgraduate Education, Box 3088, Duke Hospital, Durham

NORTH DAKOTA

Clinic Observes Silver Anniversary—The 25th anniversary of the Northwest Clinic, Minot, was recently observed, with (1) an open house reception for the public, (2) a program on which Dr Edwin F Hirsch, pathologist of St Luke's Hospital, Chicago, discussed 'Cancer of the Lungs', and (3) a dinner in the Clarence Parker Hotel at which Dr Russell A Nelson, director of the Johns Hopkins Hospital, Baltimore, was guest speaker

OHIO

Golfers' Tournament—The Ohio State Medical Golfers' Association will hold its annual tournament June 18 at the Elyria Country Club (on U S 20 between Elyria and Oberlin) Any male physician who is a member in good standing of the Ohio State Medical Association may send an application to Bob Elwell, Secretary and Treasurer, Ohio State Medical Golfers' Association, 3101 Collingwood Blvd, Toledo 10 The initiation fee for new members is \$5, and the greens fee, luncheon, banquet, and prizes, \$14

RHODE ISLAND

Brown University Appoints Health Director—Dr Charles J Hutchinson, recently retired chief medical officer of the Boston Naval Shipyard, former professor at the University of Minnesota School of Medicine, Minneapolis, has been appointed full time director of the Brown University Health Division, to succeed Dr Charles A McDonald, who will reach the retirement age July 1 His duties will include supervision of the health services for Brown and Pembroke undergraduates and students of the graduate school Following World War I duty, Dr Hutchinson held naval reserve status and in 1940 was recalled to active duty when he took charge of the naval dispensary at the University of Minnesota Thereafter, he was engaged in the medical outfitting of ships on the Pacific Coast

and served for a time as senior medical officer of an attack transport whose mission was the evacuation of casualties from Pacific island invasion beaches

SOUTH DAKOTA

State Medical Meeting at Rapid City—The South Dakota State Medical Association will hold its annual meeting in the City Auditorium, Rapid City, June 14 16 Dr Roy E. Jerntrom, Rapid City, will deliver the presidential address at the annual banquet in the Alex Johnson Hotel June 15 at 7 p m Alfred P Haake, Ph D, Chicago, economic consultant to General Motors Corporation, will be guest speaker at the banquet, which will be preceded by open house at the Rapid City Medical Center, 5-7 p m The first general session will open Monday, 8 15 a m, with a film on Dermatologic Procedures for the General Practitioner The following topics will be discussed by guest speakers

Artificial Kidney, Oliver G Stonington, Denver
Problems of the Newborn, Paul D Bruns, Denver
Surgery of Stenotic Valvular Heart Disease with Emphasis on Congenital Malformations, Robert P Glover, Philadelphia
Rheumatoid Spondylitis—Its Diagnosis and Treatment, Charley J Smyth, Denver
Treatment of Common Eye Diseases and Management of Eye Injuries, Robert W Hollenhorst, Rochester, Minn
Points to Remember When Treating Severe Epistaxis, Olav E Hallberg, Rochester, Minn
Common Pitfalls of Fracture Treatment, Roger Anderson, Seattle
Cutaneous Malignancies—Common and Uncommon, Henry M Lewis, Denver
Surgery of the Biliary Tract, Howard K Gray, Rochester, Minn
Applied Psychiatry in General Practice, Franklin G Ebaugh, Colorado
Health Education, William W Bolton, Chicago

The Woman's Auxiliary to the South Dakota State Medical Association will meet simultaneously in Rapid City The national auxiliary vice-president, Mrs George Turner, El Paso, Texas, will address the state medical meeting Monday, 9 40 a m, on 'Auxiliary Role in Medicine'

The program of the South Dakota Academy of Ophthalmology and Otolaryngology, Monday, will be presented by Drs Hollenhorst and Hallberg, Rochester, Minn

WEST VIRGINIA

Postgraduate Session—The annual postgraduate session sponsored by the Barbour-Randolph Tucker Medical Society will be held at the Tygart Valley Country Club, near Elkins, June 18 The morning will be devoted to golf The following program will be presented at 2 p m

James B Arey, Philadelphia, Pathological Basis for Respiratory Disturbances in the Newborn
Louis K Alpert, Washington, D C, Collagen Disorders
James G Arnold Jr, Baltimore, Low Back Pain
J Edwin Wood Jr, Charlottesville, Management of Congestive Heart Failure

Dr Guy H Michael, Parsons, will serve as moderator A question and answer period will follow the presentation of each paper A social hour is planned for 5 30 p m, with the Kloman Instrument Company of Charleston as the host Dr Louis A M Krause, professor of clinical medicine, University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, will address the annual banquet at 6 30 p m on 'Medicine and the Bible' The Barbour-Randolph Tucker Medical Society, of which Dr Louis H Neffien, Elkins, is president, has extended a cordial invitation to all members of the West Virginia State Medical Association to attend the meeting

GENERAL

Meeting of Physical Therapists—The annual conference of the American Physical Therapy Association will be held at the Baker Hotel, Dallas, Texas, June 15 19 The theme for the program will be "The Patient—His Evaluation and Program for Rehabilitation"

Myasthenia Gravis Meeting—The Medical Board of the Myasthenia Gravis Foundation, Inc. (480 Lexington Ave., New York 17), under the chairmanship of Dr Henry R Viets, Boston, will hold its first meeting in Atlantic City on the evening of June 14 The meeting will be preceded by a reception and dinner at the Hotel Claridge

Conference on Growth—The Society for the Study of Development and Growth has received a grant of \$1,500 from the National Science Foundation in partial support of a symposium on specificity in development to be held at the University of New Hampshire, Durham, June 19-22. The American Cancer Society, the National Cancer Institute, and the National Research Council are also supporting the symposium. The conference will include discussions of such subjects as the manufacture of proteins in the body, the part played by enzymes in development of cells and organs, and the influence of hormones on development of the embryo. The meetings will be open to all interested scientists.

United Cerebral Palsy Appoints Medical Director—Dr. Glendon L. Brooks, associate professor of pediatrics, University of Pittsburgh School of Medicine, has been appointed the first full-time medical director of United Cerebral Palsy, for which he has been serving as medical consultant. He was formerly affiliated with the Harvard Medical School and the Children's Medical Center in Boston, Central Maine General Hospital in Lewiston, and University of Pennsylvania School of Medicine and Children's Hospital in Philadelphia. In Pittsburgh he has been coordinator of hospitals and clinics at the University of Pittsburgh, professor of hospital administration in the Graduate School of Public Health, associate physician at the Children's Hospital, and consultant in charge of pediatrics at Montefiore Hospital.

Society News—The Southwest Allergy Forum will meet at the Hotel Muehlebach, Kansas City, Mo., June 14-16 under the presidency of Dr. Orval R. Withers of that city. The sessions will be devoted primarily to papers on practical aspects of allergy. —Dr. Randall G. Sprague, associate professor of medicine at the Mayo Foundation and consulting physician at the Mayo Clinic, Rochester, Minn., a diabetic since childhood, was elected president of the American Diabetes Association at its annual meeting in New York City. Dr. Sprague, the first diabetic to hold this office, addressed a free public meeting open to diabetics, their families, and friends, on "The Art of Living with Diabetes," in which he described his 30 years' experience as a diabetic, as a physician treating diabetics, and as a scientist studying diabetes.

Neurologists Meet in Atlantic City—The American Neurological Association will hold its annual meeting June 15-17 at the Hotel Claridge, Atlantic City, N. J. Dr. Hans H. F. Reese, Madison, Wis., will deliver the presidential address Monday at 9 a. m. At 8 p. m. the following symposium on neurological education will be held in Trimble Hall:

Philosophy of a Medical School Department of Neurology Roland P. Mackay, Chicago
Content of the Neurological Course Russell N. De Jong, Ann Arbor, Mich.
Techniques Adolph L. Saks, Iowa City
Organization of a Neurological Department in a Medical School H. Houston Merritt, New York
Graduate and Postgraduate Training Henry W. F. Woltman, Rochester, Minn.

The Tuesday morning session will be devoted to 10 presentations with moving picture demonstrations (board room), including results of electroencephalograms, pneumoencephalograms, carotid angiography, and attempts at dural sinus visualization in the case of the Brodie craniopagus twins. The annual dinner for members of the association and guests will be held Tuesday, 7 p. m. The American Association of Neuropathologists will hold its meeting Sunday, June 14, at the Hotel Claridge.

Medical Librarians Meet in Salt Lake City—The annual meeting of the Medical Library Association, Inc., will be held at the Newhouse Hotel, Salt Lake City, June 16-19. At the opening session Tuesday 2 p. m. Drs. John Z. Bowers, dean, University of Utah College of Medicine, and Kenneth B. Castleton, president, Utah State Medical Association, will welcome the delegates. "Methods of Investigation of Human Inheritance" will be discussed by Dr. Frank H. Tyler and Fayette E. Stephens, Ph.D., University of Utah. The medical school group will meet at 8 p. m. in the Franciscan Room. "Medical School Library Administration" will be discussed by Frank A. Lundry, M.A., director of libraries, University of

Nebraska, and "The Role of the Medical Library in the Medical School Curriculum" by Chauncey D. Leake, Ph.D., vice-president, University of Texas Medical Branch, Galveston. On Wednesday at 3:30 p. m. Dr. Ralph T. Richards, Salt Lake City, will present "The Development of Medicine in Utah." The annual banquet will be held in the Bonneville Room at 7 p. m. Dr. C. H. Hardin, Branch, University of Utah College of Medicine, will be the speaker at luncheon Thursday, 12:30 p. m. in the University of Utah Union Building ballroom. At 2:15 p. m. a film, "Seizure," will be shown in the theater of the VA Hospital, Fort Douglas. Introduction and comments will be made by Dr. Madison H. Thomas, University of Utah. Dr. Sanford V. Larkey, Baltimore, chairman, American Documentation Institute, will participate in the general session on national and international activities Friday, 9 a. m., in the Gold Ballroom.

Prevalence of Poliomyelitis—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States, its territories, and possessions in the weeks ended as indicated:

DEATHS

Longcope, Warfield Theobald Ⓢ Lea, Mass, professor emeritus of medicine at his alma mater, died at his home on Cornhill Farm April 25, aged 76, of emphysema. Dr Longcope was born in Baltimore March 29, 1877, and received his M D degree from Johns Hopkins University School of Medicine in Baltimore in 1901. He then spent 10 years in Philadelphia, as resident pathologist of the Pennsylvania Hospital, 1901-1904, as director of the Ayer Clinical Laboratory, 1904-1911, and as assistant professor of applied medicine at the University of Pennsylvania School of Medicine from 1909 to 1911. In the autumn of 1911 Dr Longcope moved to New York and during the next 10 years filled important positions at Columbia University and the Presbyterian Hospital simultaneously. He was an associate professor, 1911-1914, Bard Professor of Applied Medicine 1914-1921 at Columbia, and during the same period an associate visiting physician, then director of medical service at the Presbyterian Hospital. In 1934 he was elected a member of the board of scientific directors of the Rockefeller Institute for Medical Research in New York City and in 1939 was elected president. In 1922 he became professor of medicine at Johns Hopkins University School of Medicine in Baltimore and retired in June, 1946, after 24 years affiliation with the institution. For a short time in 1922 he was a professor of clinical medicine at Cornell University Medical College in New York. During World War I he served in the medical division of the Office of the Surgeon General and with the American Expeditionary Forces. He was a specialist certified by the American Board of Internal Medicine, an Associate Fellow of the American Medical Association formerly vice-president and president of the Association of American Physicians, which in 1948 awarded him the George M Kober medal for his contribution to medicine and medical education, and formerly vice president of the American Association for the Advancement of Science. He was a member of the American Society for Clinical Investigation, American Clinical and Climatological Association, National Academy of Sciences, American Society for Experimental Pathology, New York Academy of Medicine, American Academy of Arts and Sciences, and the Harvey Society, fellow of the American College of Physicians, an honorary member of the Société des Hôpital aux de Paris, and Royal Society of Medicine, and an honorary fellow of the Scandinavian Congress for Internal Medicine and the College of Physicians of Philadelphia. In 1934 Dr Longcope received the honorary degree of doctor of laws from St John's College in Annapolis, Md, in 1941 the degree of doctor of science from the University of Rochester in Rochester, N Y, and in 1945 the Docteur "honoris causa," University of Paris. Dr Longcope's own extensive researches were conducted in the fields of clinical medicine and pathology.

Gray, Irving Ⓢ Brooklyn, born in New York City in 1892, University and Bellevue Hospital Medical College, New York, 1913, specialist certified by the American Board of Internal Medicine, member of the American Gastro Enterological Association, American Public Health Association, and the Industrial Medical Association. fellow of the American College of Physicians, during World War I served in the medical corps, consulting physician, Brooklyn State and Coney Island hospitals in Brooklyn, Sea View Hospital in Staten Island, St. Joseph Hospital in Far Rockaway, Long Beach (N Y) Memorial Hospital, and Rockaway Beach (N Y) Hospital, died April 21, aged 60.

Howles, James Kirby Ⓢ New Orleans born in Memphis, Tenn, Jan 5, 1898. University of Cincinnati College of Medicine, 1929, professor of dermatology and syphilology and head of the department of Louisiana State University School of Medicine, specialist certified by the American Board of Dermatology and Syphilology, member of the American Academy of

Dermatology and Syphilology, fellow of the American College of Physicians, affiliated with Southern Baptist Hospital, Touro Infirmary, Charity Hospital of Louisiana, Hotel Dieu, and Mercy Hospital Soniat Memorial, author of "Synopsis of Clinical Syphilis", died April 2, aged 55, of coronary thrombosis.

Albrecht, Herman Fred Ⓢ Detroit, Detroit College of Medicine and Surgery, 1916, died Feb 4, aged 59.

Bartee, Luke Harvey, Port St Joe, Fla, University of Georgia Medical Department, Augusta, 1899, died Feb 16, aged 81, of bronchopneumonia.

Bass, Harris Hartwell Ⓢ Henderson, N C, University of Pennsylvania School of Medicine, Philadelphia, 1928, died recently, aged 50.

Carman, Richard Perry Ⓢ Baltimore, University of Maryland School of Medicine, Baltimore, 1901, died Feb 3, aged 85, of uremia.

Corpening, Flave Hart, Horse Shoe, N C, Jefferson Medical College of Philadelphia, 1928, died March 7, aged 50.

Cox, Harold Crisp Ⓢ Hightstown, N J University of Pennsylvania School of Medicine, Philadelphia, 1926, past president of the Mercer County Medical Society on the staffs of St Francis Hospital in Trenton and the Princeton (N J) Hospital, died in the University of Pennsylvania Hospital in Philadelphia, Feb 13, aged 52, of heart failure and hypertension.

Cruikshank, Omar Trees, Pittsburgh, University of Pennsylvania Department of Medicine, Philadelphia, 1901, died in VA Hospital, Aspinwall, recently, aged 78.

Eshleman, Lindley Heath Ⓢ Marion, Ind, Kentucky School of Medicine, Louisville, 1896, an Associate Fellow of the American Medical Association, at one time city health officer, past president of the Grant County Medical Society, past president of the Marion City Board of Health, of which he was secretary affiliated with Marion General Hospital, died in Robert W Long Hospital, Indianapolis, Feb 28, aged 82, following an operation for gastric ulcer.

Hogan, George Archibald Ⓢ Birmingham, Ala, Birmingham Medical College, 1896, served on the faculty of his alma mater; died Feb 21, aged 81, of pulmonary embolism.

Hooper, Vernon Jay, Los Angeles, Michigan College of Medicine and Surgery, Detroit, 1898, served during the Spanish-American War and World War I, for many years practiced in Detroit, died Feb 7, aged 82, of bronchopneumonia.

Janney, Francis White Ⓢ Baltimore, University of Maryland School of Medicine, Baltimore, 1905, an Associate Fellow of the American Medical Association affiliated with Baltimore Eye Ear and Throat Hospital, on the staff of the Cambridge (Md) Hospital, died Feb 1, aged 70, of heart failure.

Kahle, William D, Falls Mills, Va, College of Physicians and Surgeons, Baltimore, 1911, died Feb 4, aged 68, of coronary occlusion.

Klein, Rose Herchman, Hartford, Conn, Woman's Medical College of Pennsylvania, Philadelphia, 1940, certified by the National Board of Medical Examiners, member of the American College of Allergists, affiliated with Mount Sinai Hospital, died recently, aged 50.

Lindsay, Samuel Sebastian, Manchester, Iowa Bellevue Hospital Medical College, New York, 1891, died recently, aged 86, of cerebral thrombosis, chronic lymphatic leukemia, and arteriosclerosis.

Lurie, Sophie Arkadyevna Ⓢ Los Angeles, University of St Vladimir Faculty of Medicine, Kiev, Russia, 1913, member of the American Academy of Dermatology and Syphilology, died recently, aged 70, of carcinoma of the stomach.

McCubbin, Hardy Louis, Sacramento, Calif., College of Physicians and Surgeons of San Francisco, 1899, at one time physician in charge of El Reposo Sanitarium in Reno, Nev. died Feb. 26, aged 88, of cancer.

McCulloch, Horace Dwight, Toronto, Ohio, Ohio Medical University, Columbus, 1906, served as school physician and health officer, affiliated with Ohio Valley Hospital, Steubenville, died Jan. 20, aged 83, of thrombosis of the femoral artery.

McGarity, Joseph Arthur, Athens, Ga., Medical College of Georgia, Augusta, 1916, died in Athens General Hospital Feb. 14, aged 65, of hypostatic pneumonia.

McLean, Daniel Calvin, Blytheville, Ark., University of Nashville (Tenn.) Medical Department, 1910, on the staff of the Walls Hospital, died Feb. 10, aged 68, of thrombosis.

Meany, Thomas Edward ♂ Chicago, Chicago College of Medicine and Surgery, 1909, fellow of the American College of Surgeons, formerly on the faculty of Loyola University School of Medicine, consulting orthopedic surgeon, Chicago State Hospital, died in St. Anne's Hospital March 21, aged 68, of cerebral hemorrhage and leukemia.

Miniggio, Antonio ♂ Reno, Nevada, Regia Università di Torino Facoltà di Medicina e Chirurgia, Italy, 1900, a captain in the Italian Army during World War I, on the staffs of the Washoe Medical Center and St. Mary's Hospital, where he died March 27, aged 76, of pulmonary embolism following extensive contusion of the thigh and leg.

Mitchell, Carl Apperson ♂ Benton Harbor, Mich., Bennett College of Eclectic Medicine and Surgery, Chicago, 1906, member of the Industrial Medical Association, an Associate Fellow of the American Medical Association, past president of the Berrien County Medical Society, served as city health officer and as a member of the board of education, served overseas during World War I, on the staff of Mercy Hospital, died in Tavares, Fla., March 17, aged 73, of coronary thrombosis.

Olmsted, Austin Orin ♂ Green Bay, Wis., the Hahnemann Medical College and Hospital, Chicago, 1902, past president of the Brown-Kewaunee Door Counties Medical Society, member of the Radiological Society of North America and the American Radium Society, for many years president of the board of education, died Jan. 14, aged 72, of carcinoma of the colon.

Park, William Edwin, Asheville, N. C., Bellevue Hospital Medical College, New York, 1898, served during World War I, died March 9, aged 76, of cerebral thrombosis and arteriosclerosis.

Roberts, David Daniel ♂ Enid, Okla., Hospital College of Medicine, Louisville, Ky., 1906, past president and secretary of the Garfield County Medical Society, member of the American Association of Railway Surgeons, a medical officer during World War I, chief surgeon of Frisco, Rock Island, and Santa Fe railroads served on the staffs of University Hospital and St. Mary's Hospital, where he died March 2, aged 75, of coronary occlusion.

Robison, Claude Alvin ♂ Frankfort, Ind., Indiana University School of Medicine, Indianapolis, 1918, on the staff of the Clinton County Hospital, formerly city councilman, died Feb. 2, aged 60, of cerebral thrombosis.

Rutledge, Harold Hunt ♂ Richmond, Ky., University of Louisville School of Medicine, 1936, served during World War II, member of the American Academy of General Practice, formerly connected with the health department of the state of Kentucky, director of Tate County Health Department and health officer of Whitley and Madison counties, died in the General Hospital, Louisville, Feb. 11, aged 42, of a heart attack.

Schick, Martin F. ♂ Fort Wayne, Ind., University of the City of New York Medical Department, 1882, an Associate Fellow of the American Medical Association, on the staff of Lutheran Hospital, died March 10, aged 92, of heart failure.

Sinning, Charles Edward, Orlando, Fla., Barnes Medical College, St. Louis, 1899, died Feb. 2, aged 77, of a heart attack.

Stith, Robert Boyd Jr. ♂ Florence, S. C., Duke University School of Medicine, Durham, N. C., 1935, certified by the National Board of Medical Examiners, chairman of the city board of health, served during World War II, and for exceptional and courageous conduct under fire on the Anzio Beachhead, Italy, was awarded the Bronze Star, on the staff of the McLeod Infirmary, died Feb. 13, aged 41, of coronary thrombosis.

Sumner, Gordon Sykes ♂ Sylvester, Ga., Atlanta School of Medicine, 1906, served in the Georgia State Legislature for 13 terms in the senate, died in Atlanta March 13, aged 69, of carcinoma of the prostate.

Taylor, William Ivey ♂ Burgaw, N. C., North Carolina Medical College, Davidson, 1902, died March 4, aged 76, of lobar pneumonia.

Teel, Ambrose Wilson ♂ Redlands, Calif., College of Physicians and Surgeons, Keokuk, Iowa, 1895, served during World War I, affiliated with Glendale (Calif.) Sanitarium and Hospital and the Los Angeles General Hospital, died March 24, aged 81, of an injury received in a fall.

Thompson, Clyde Coleman, Delhi, La., Memphis (Tenn.) Hospital Medical College, 1911, died March 19, aged 70.

Tucker, Jesse E., Elizaville, Ind., Physio-Medical College of Indiana, Indianapolis, 1895, died March 10, aged 83.

Wagenhals, Franklin Clark ♂ Columbus, Ohio, Johns Hopkins University School of Medicine, Baltimore, 1913, emeritus professor of neurology at the Ohio State University College of Medicine, member of the American Psychiatric Association, died in Paris, France, March 16, aged 68.

Walker, Lewis Winston, Auburn, Miss., Mississippi Medical College, Meridian, 1909, affiliated with McComb Infirmary, McComb, where he died March 30, aged 72, of acute enterocolitis.

White, Joshua Warren ♂ Norfolk, Va., Medical College of Virginia, Richmond, 1901, specialist certified by the American Board of Ophthalmology and American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology and the American Laryngological, Rhinological and Otolological Society, fellow of the American College of Surgeons, served during World War I, on the staff of St. Vincent's Hospital, died in Palm Beach, Fla., March 4, aged 77, of coronary thrombosis.

Widney, John Theodore Bland, Clovis, Calif., Washington University School of Medicine, St. Louis, 1902, died in Fresno March 27, aged 74, of arteriosclerotic heart disease.

Wilbur, Herbert Lincoln ♂ Joplin, Mo., University Medical College of Kansas City, 1908, past president of the Jasper County Medical Society and the Newton County Medical Society, served during World War I, formerly city physician, affiliated with Freeman Methodist Hospital and St. John's Hospital, where he was past president of the staff, and where he died March 15, aged 76, of pulmonary and cerebral thrombosis.

Wilkinson, Michael Robert ♂ Oconomowoc, Wis., Northwestern University Medical School, Chicago, 1893, served as president of the Waukesha County Historical Society and as a director of the Oconomowoc High School, died March 15, aged 88, of chronic myocarditis and arteriosclerosis.

Wolff, Walter Hans ♂ Massapequa, N. Y., Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany, 1922, affiliated with Hospital for Joint Diseases, died in Meadowbrook Hospital, Hempstead, Feb. 7, aged 57, of congestive heart failure.

Yingling, Estey Cecil ♂ Lima, Ohio, Starling Medical College, Columbus, 1906, formerly secretary of the Academy of Medicine of Lima and Allen County, of which he was vice president and president, served during World War I, on the staff of Lima Memorial and St. Rita's hospitals, died Feb. 28, aged 72, of chronic lymphatic leukemia.

GOVERNMENT SERVICES

PUBLIC HEALTH SERVICE

Service Discontinued in Cleveland Hospital—The U S Public Health Service Hospital, Cleveland, will discontinue admitting inpatients immediately, the Public Health Service announced May 20. An outpatient clinic will be established in downtown Cleveland as soon as the patients now receiving care can be discharged or transferred to other hospitals. The action was necessary because of the impending withdrawal of all patients of the Veterans Administration from the general and tuberculosis hospitals of the Service for the fiscal year beginning July 1. The 190 bed P H S Hospital in Cleveland has been operating currently at a daily average census of 139, of which 55 are veterans. Removal of the veteran patients would reduce the daily average count to about 85, or 45% of capacity, and it would be impossible to operate the hospital efficiently and economically with such a low level of utilization. The Public Health Service will continue to provide medical care to merchant seamen, coast guardsmen, and other beneficiaries in the Cleveland area. The clinic replacing the hospital will be staffed by full time personnel. Beneficiaries requiring hospitalization can receive treatment in the P H S Hospital, Chicago. Public Health Service beneficiaries requiring emergency hospitalization in Cleveland will receive it in local hospitals at P H S expense by contract arrangement.

The National Institutes of Health building no. 10 is the new Clinical Center.

New Clinical Research Center—The newly completed Clinical Center of the National Institutes of Health is scheduled to admit research patients early in July. Located at Bethesda, Md., the center is a laboratory and clinical facility containing resources for the care and study of 500 patients. Occupancy will be gradual, it is planned to activate half the beds during the first year of operation and the remaining half during the second year. The Clinical Center will serve the seven National Institutes of Health, which form collectively the principal research arm of the U S Public Health Service. Thus, a clinical research dimension will be added to the Service's laboratory studies, which are concentrated for the most part on the major chronic diseases. For details see THE JOURNAL, Oct 11, 1952, p 541.

Personal.—Dr Erval R Coffey has replaced Dr Richard F. Boyd as the medical director in the U S Department of Health, Education, and Welfare's regional office in Boston. Dr Boyd is being transferred to San Francisco to fill the same position in the department's regional office. Dr Coffey, an officer of the Public Health Service for 29 years, has been in Thailand for the past two years directing the efforts of 23 physicians, nurses, and sanitary engineers who made up the public health division of this country's technical mission to Thailand under the Mutual Security program.

NAVY

Conference on Submarine Medicine—Experts on submarine medicine gathered for a conference May 13 at the Naval Gun Factory, Washington, D C. The medical officers discussed problems associated with current apparatus now used by underwater demolition teams, diving equipment, and the physiological and psychological problems associated with this hazardous Navy work. In attendance were representatives of the Bureau of Medicine and Surgery, Naval Medical Research Institute, Bethesda, Md., the Navy Medical Research Laboratory, Submarine Base, New London, Conn., Underwater Demolition Group No 2, the Force Submarine Medical Officer, Atlantic Fleet, and the Experimental Diving Unit, Naval Gun Factory. Plans were made for another meeting with civilian investigators in the field of submarine medicine. The proposed meeting will be held this fall.

Intern Training at Naval Hospitals—The Surgeon General has announced that of the 176 Navy internships offered senior medical students who will graduate from medical schools throughout the United States in 1953, 169 have formally accepted assignments in Naval hospitals. Their training will begin July 1, 1953, and will be under the Navy's Graduate Medical Training Program. The students will be appointed lieutenants (junior grade) in the Naval Reserve Medical Corps, following graduation and will then be ordered into the active military service and assigned to Naval hospitals approved for intern training by the A M A Council on Medical Education and Hospitals.

MISCELLANEOUS

Food and Drug Administration—Retirement of John J McManus, Atlanta district chief of the Food and Drug Administration, was announced May 31 by Charles W Crawford, Commissioner of Food and Drugs, U S Department of Health, Education, and Welfare. Mr McManus will be succeeded by Dr Kenneth L Milstead, now director of regulatory management in the FDA's Washington office. Dr Milstead was formerly chief of the Cincinnati district. James C Pearson, who has been assistant director of regulatory management since April, 1949, was named by Mr Crawford as the new director. The division of regulatory management handles the preparation of scientific evidence for use in the trial of contested cases. In a tribute to Mr McManus, Commissioner Crawford said, Mr McManus today closes a career of 45 years in behalf of pure, honestly labeled foods, drugs, and cosmetics. It has been one of genuine and fruitful service to the American people.

New Headquarters for National Science Foundation.—The National Science Foundation has moved to a new location, 1520 H Street, NW, Washington 25, D C. The new headquarters are in the old 'Cosmos Club' building recently taken over and renovated by the General Services Administration. The new telephone number is STerling 3 2140. The government telephone code is 1224. The government messenger service code remains Stop 19. There is no change in the Western Union desk-fax call letters QBM. The mailing address will continue to be National Science Foundation, Washington 25, D C.

VETERANS ADMINISTRATION

Personal.—Dr Lee H Schlesinger of Clarksburg, W Va., has been appointed manager of the new VA Hospital in Chicago (West Side), and Dr Walter S Pugh of Providence, R I, has been named manager of the VA Hospital in Erie, Pa. The West Side hospital in Chicago, a 496 bed general medical and surgical installation, is scheduled to open late this summer.

AUSTRALIA

Administration of BCG Vaccine—BCG vaccine has to be obtained from the Commonwealth Serum Laboratories at Melbourne, to which it is necessary to give two weeks' notice. The order has to be placed through the health department in the state concerned. The vaccine is delivered by air, and must be collected immediately from the airplane, placed in a refrigerator, and used within the next 24 to 36 hours. Before a person can receive BCG vaccine it is necessary for him to be Mantoux tested on two occasions at six week intervals. Roentgenography of the chest is an essential preliminary. Four weeks after the BCG vaccine has been given, the reaction is read and noted. Four weeks later another Mantoux test is done, and further Mantoux tests are required at six month intervals. The Commonwealth Serum Laboratories refuse to supply BCG vaccine unless this technique is adhered to. Complete records have to be kept on a special card.

Kodak Finances Medical Research—Between one quarter and one third of the profit of Kodak (Australia) Pty Ltd is now devoted to medical research in Australia. This is due to the philanthropic activities of the joint founder of the Australian organization, Mr Thomas Baker, who died in 1928. A perpetual trust fund was established in that year known as the Thomas Baker (Kodak), Alice Baker, Eleanor Shaw Benefactions Fund. The medical research institute at the Alfred Hospital, Melbourne, bears the name of the benefactors, but is usually known as the Baker Institute of Medical Research. The institute has made valuable contributions to medical knowledge in a wide variety of medical fields. Possibly the most outstanding scientist who has worked in the laboratories of the institute has been Willis, the pathologist, now at Leeds.

Medical Education—Americans have an enthusiasm for education that is lacking in Australians, stated Prof W B MacFarlane, who is professor of physiology in the University of Queensland. He recently returned from a visit to the United States. He reports that 13% of Americans are students at colleges and universities, a much higher proportion than in Australia. At present 1 American in 80 is at a college or a university. In Queensland the number is about 1 in 350. Americans spend \$10 per person per year on higher education compared with about \$1.10 in Queensland. In the United States students spend between \$500 and \$1,000 per year to attend medical schools. In Queensland they pay about \$110.

Rare Chloramphenicol Complications—There has been no evidence in Australia of serious complications following the use of chloramphenicol. On the other hand, this drug has been the mainstay of treatment of gastroenteritis in children, especially in Queensland, where infections by a *Salmonella* microorganism caused a high death rate in an epidemic in 1946-1947. The second epidemic, three years ago, was controlled by the use of chloramphenicol. A watch has always been kept on the blood cell count of children being treated with this drug, and if a tendency for the count to fall is detected the therapy is stopped.

Record Incidence of Diabetes—Sydney has one of the highest diabetes rates in the world, stated Dr R D Lawrence, world authority on diabetes, and physician to the Kings College Hospital in London. Two per cent of Sydney's population have diabetes, compared with one half per cent in England and one and one half per cent in the United States. Dr Lawrence ascribed this high incidence to overeating.

DENMARK

Hospital Costs Then and Now—The Aalborg County Hospital has been studied by E Schiødt for a comparison of the financial years 1913-1914 and 1951-1952. There was a sevenfold increase in the number of patients, a rise from 906 admissions in the first period to 6,518 in the second. Much greater use was made of the hospital beds in the second than in the first period, each bed standing unoccupied only 10 days in the second period, while the corresponding figure for the first period was 85. The total sum spent in the second period was 22 times greater than that spent in the first period, but the expenditure per patient was only 3 times greater, when the purchasing value of the krone in the two periods was taken into account, hospital treatment in reality had become cheaper. To understand this conclusion it should be made clear that the average duration of residence in hospital was reduced from 42 days in the first period to 18 in the second. In the period under review the number of physicians employed by this hospital had risen from 3 to 21, and that of nurses and student nurses from 34 to 136. Yet the number of patients per physician remained practically unchanged, with 302 in the first period and 310 in the second. On the other hand, there was a considerable rise in the number of patients treated per nurse, from 27 to 48. In the first period salaries for the staff accounted for only 17% of the total cost, whereas they did so for 44% of the total cost in the second period.

Between the two periods studied there was a profound change in the indications for admission to hospital. With the discovery of penicillin scarlatina patients need no longer be admitted to hospital. For much the same reason patients with pneumonia have now become rare in hospital. On the other hand, a new group of patients is now being admitted to hospital for treatment with antibiotics and corticotropin (ACTH). The circulation of patients in hospital is now speeded up, with both surgical and medical patients being discharged with a view to their treatment being completed at home by general practitioners. This means greater cooperation between the physicians in hospital and outside it. Schiødt, whose study is published in *Ugeskrift for læger* for March 5, 1953, concludes that the experiences of Aalborg County Hospital may be regarded as typical of other Danish public hospitals.

Medical Students in Place of Iron Lungs—Brief reference has already been made in THE JOURNAL (151:1126 [March 28] 1953) to the part played by medical students when Copenhagen was overtaken by a catastrophic outbreak of poliomyelitis in the autumn of 1952. The 500 beds of the Blegdam Fever Hospital soon proved inadequate and had to be supplemented by numerous beds in other hospitals. Early in the outbreak the Danish and foreign narcosis specialists were unable to cope with the calls made on them for artificial respiration. Towards the end of August the first appeal for volunteers was made to the Medical Students' Council, which was asked to supply 10 students to help with the bag ventilation of patients. Their task was considered so responsible that at first only senior medical students were asked to volunteer. Some 150 did so in September, and they were organized in teams of 4 or 5 students each. By the end of September the supply of senior students proved insufficient, and junior students were called on, with some misgivings. They rose to the occasion, doing excellent service after mastering the necessary technique and precautions to be taken. Early in November the supply of medical students had been exhausted, and Professor Lassen, who is in charge of the Blegdam Hospital, sent out an appeal to the dental students. More than 200 of them answered this appeal, with the result that the time each student had to spend in hospital could be reduced.

Altogether some 1,400 of the some 1,700 medical students in Copenhagen took part in this work and were paid at the rate of about 30 shillings for eight hours. This modest remuneration may seem trifling in comparison with the clinical

experience and insight into the nursing of the sick gained by these students as they worked hour after hour with a patient. In recognition of the services of these students and other members of the staff of the Blegdam Hospital, the municipal authorities of Copenhagen, headed by the Burgomaster Julius Hansen, addressed a letter of thanks to the Danish Medical Association. Some figures published by the burgomaster are a concrete expression of the calls made on the hospital. Though its budget allows for 27 physicians, it actually employs 60, of whom 15 are narcosis specialists. The budget provides for some 265 nurses, whereas the actual number of nurses employed is 625. In October payments made to students amounted to about 150,000 kroner. On Nov 5 some 600 patients with paralytic cases of poliomyelitis were under treatment. These figures tell little of the epic of the medical students of Copenhagen in the autumn of 1952.

SPAIN

International Congress of Therapeutics.—More than 1,000 members attended the Third International Congress of Therapeutics held recently in Madrid. Among the official topics were potassium and the use of radioactive isotopes.

Potassium.—Prof. Z. M. Bacq of Belgium stated that according to Hodgkin's technique the intracellular concentration of potassium in excitable tissues is a passive phenomenon, secondary to the active secretion of sodium ions. It can be proved that the erythrocytes of human blood actively eliminate sodium and passively concentrate potassium. It is known only that they do not function when glycolysis is not normal.

Drs. R. Hazard and J. Hazard of France, in a résumé of their work, stated that the normal potassium of the body has complicated actions, the direction of which may change in accordance with the concentration in which potassium is used up by the body, and also in accordance with the antagonism or synergism that the substance encounters in the body. Potassium intervenes in the metabolism of glycolides, similar to the manner of glucose when the latter is present as a reserve. Potassium takes a part, also, in the metabolism of protids and in regulating the acid base equilibrium. Hypopotassemia causes alkalosis, the control of which depends mainly on the proper secretion of active substances of the suprarenal cortex. Secondly, it is controlled by the suprarenal medullary hormone and by the mechanism of renal elimination. From a pharmacological point of view, potassium can be either useful or dangerous, depending on the concentration in which it acts. Its toxicity varies with the degree of initial concentration of its salts. Potassium is dangerous to the heart when its level of concentration in the blood is so high that it cannot be rapidly lowered by elimination through the kidneys. Potassium, even in small doses, has a stimulating effect on the central nervous system when it contacts the cerebral cells. In higher concentration it produces inhibition of the medullar and bulbar centers. It is closely related to epinephrine and acetylcholine, the chemical intermediary substances that stimulate the autonomic nervous system. Potassium is indispensable to the production of parasympathetic stimulation. The vagal stimulation results in the liberation of both potassium and acetylcholine, whereas the sympathetic stimulation results in liberation of potassium, epinephrine, and some other sympathins. The potassium ion has a biphasic effect on the muscular system. It stimulates liberation of small doses of potassium and prevents liberation of large doses by a mechanism of double circuit between acetylcholine and potassium, each of which stimulates liberation of the other at the level of the muscle. Potassium is indispensable for the contractility of the heart, however, the toxic effect appears when the concentration of potassium is above the useful level. The changes of the electrocardiogram, as caused by either hypopotassemia or hyperpotassemia, are well known. The potassium ion, when in low concentration, favors excitability of the motor nerve fibers by preventing the activity of high concentrations. The inhibitory action easily appears on the sensory nerve fibers, and certain potassium salts increase the activity of local anesthetics. On the smooth fibers of the intestine the potassium ion seems to cause liberation of acetylcholine, potentiation of the tonic effects of this

substance, and stimulation of muscular action. In relation to antagonistic substances, the speakers pointed out that the calcium ion is the most active and the commonest antagonistic substance. It acts on the central nervous system, on the autonomic nervous system, on neuromuscular excitability, and on the heart. The antagonism may even result in changing the effects of digitalis, and as calcium increases potassium decreases.

Drs. G. Bickel and H. C. Plattner of Switzerland reported the results of studies made on all the syndromes of hyperpotassemia and hypopotassemia. The pathogenetic factors, clinical forms, changes seen on the electrocardiogram, and the diseases most commonly complicated by these syndromes were discussed. There is a form of hyperpotassemia of renal insufficiency with oliguria or anuria and other forms in hemolytic and traumatic syndromes, in diabetic coma, and in Addison's disease. There are also different forms of hypopotassemia in diarrheal syndromes, in hypoglycemic coma, in nephritis, in the Cushing's syndrome, and in syndromes caused by administration of large doses of corticotropin, desoxycorticosterone, and cortisone. The forms of hypopotassemia caused by administration of large doses of sodium salts and those that are a complication of pyloric stenosis, of obstruction of the upper segments of the intestine, or that follow an operation, were also discussed.

Prof. F. Rietti of Italy stated that the basal potassium is of clinical value in the majority of cases, although it does not always reflect the actual condition of the intracellular potassium. The syndromes associated with hyperpotassemia are always graver than those associated with hypopotassemia. The changes in the electrocardiogram have a definite clinical value, but the electrocardiogram cannot replace the laboratory determinations of potassium in the blood. The main factors of hypopotassemia are fasting, an insufficient supply of potassium to the body, rapid elimination of the substance through the kidneys, post therapeutic diabetic acidosis, hyperactivity of the suprarenal cortex, vomiting, diarrhea, dilution of the extracellular fluids as a result of administration of solutions that do not contain potassium, and the use of certain drugs. The speaker described some cases of cryptogenetic chronic hypopotassemia, which is very rare. The pathological changes of potassemia are always due to acute diseases.

Drs. E. Jaso and E. Iturriga of Madrid reported results of their investigations conducted on the significance of potassium in pediatric diseases. The symptoms of hypopotassemia in children consist of muscular hypotonia, deep hyporeflexia that in some cases progresses into actual paralysis, meteorism, and paralytic ileus. There are changes in the electrocardiogram, and the figures of potassium in the blood plasma are low. Diarrhea in infants, hypertrophic stenosis of the pylorus, congenital alkalosis with diarrhea, infantile steatorrhea, and bulbar poliomyelitis are specific pediatric diseases that develop with a deficiency of potassium. Potassium therapy is indicated in any of these diseases. The deficiency of potassium in infantile diarrhea is due to (1) a loss of potassium through the feces, vomiting and perspiration, (2) a diminished amount of potassium administered in the diet, or a lack of administration of the substance, (3) administration of salt solutions in therapy of dehydration, and (4) the changes of the intracellular exchange caused by sodium. In the early period of these diseases the amount of potassium in the blood serum is large in about 25% of the cases. The increase is due to liberation of potassium by the tissues. Later, hypopotassemia follows and the amount of potassium in the muscular tissues is small, as found by determinations carried on by the speakers. Some of the children observed by the speakers had potassium therapy in association with the treatment of the given disease. The rest of the children were the controls. The clinical course of the disease was about the same in both groups of children. The electrolyte shock was controlled sooner in patients who had potassium therapy than in the controls. There were early hypoproteinemia and hypoalbuminemia. Total hypoproteinemia developed in children with acute dystrophy. The figures of the gamma globulin fraction increased. The increase was so sharp in certain cases that the figures were four times higher than normal. In patients in either group, namely, those who had potassium therapy and those who did not, the figures of

chloremia were low during shock and normal after it. The hematocrit value and the number of erythrocytes followed the standard of the disease in the given case, without changing with the administration of potassium. From a statistical point of view, the speakers were unable to confirm previous reports in the literature on the good results of potassium therapy in toxic diarrhea of infants. The figures obtained by the speakers in children who had potassium therapy can be superimposed on those observed in the controls (a 13% rate of mortality). In the administration of potassium the speakers followed Darrow's scheme of dosage. They administer the substance either by parenteral or oral route. In certain cases they used the mixture advised by Gosta Davidsen. In toxicosis of infants, the speakers warned against the administration of potassium serum on the first day of the disease because of the fact that hyperkalemia is present on that day. Only when one can prove that there is hypokalemia should potassium serum be given. When the patients show toxic symptoms after therapeutic administration of potassium, the speakers advise to resort to a combined treatment of dextrose, insulin, and calcium.

Drs. Di Guglielmo and Vallecorsi reported results of studies on the contents and distribution of potassium in the body and the techniques of administration of potassium salts. They advised the use of potassium chloride, which contains about 50% potassium, can be sterilized without difficulty, and can be administered by any route. Also, gluconate, citrate, and phosphate can be used. The speakers resorted to the administration of potassium in certain diseases without hypokalemia, namely, in certain cardiac diseases (hypostole, ventricular tachycardia, and extrasystolic arrhythmia), in arterial hypertension (with moderate and uncertain effects), and in certain diseases of the muscles, without hypokalemia. It can also be given as a diuretic, but the administration of the substance is dangerous in cases of oliguria of renal origin, it is frequently given in cases of bronchopulmonary allergy, pleurisy, adenitis, and arthritis, and as a solvent of antibiotics.

Dr. Castro Mendoza reviewed the various techniques used in the determination of potassium. The most exact and sensitive microdetermination is that of precipitation with chloroplatinic acid, which is comparable to the macrogravimetric methods. For clinical uses, the procedures using cobaltinitrite are sufficient, although the limitations of exactness of these procedures are well known. For the final titration, cerimetry or colorimetry of the cobalt ion can be recommended. Spectrometry is not sufficiently precise for common use, although it has a great sensitivity. In photometric evaluations, the flame photometer has the advantage of the rapidity with which the evaluations can be made. This method permits one to work in large series, although its exactness is not as accurate as that of the method of the chloroplatinic acid. Some other methods, such as the precipitation with phospho 12-tungstate dipicrylamine, and others, are still very new and not widely used.

Massive Hormonal Therapy.—Dr. Perez Vitoria of Barcelona suggested changing the term retarded hormonotherapy to slow hormonotherapy. This therapy is indicated when it is advisable to prolong the effect of the hormones. It is also indicated in cases of acute endocrine disturbance and in cases in which it is necessary to reduce the number of injections to make an economical treatment. The retarded forms of hormonal therapy include only insulin, epinephrine, posterior pituitary injection (Pituitrin), testosterone, estrogens, progesterone, androsterone, desoxycorticosterone, cortisone, and corticotropin (ACTH). Frequently its results are much better than those of other ordinary forms of therapy. The preferable form of the substance to be used is microcrystals. The tablets of the substance are to be rejected for implantation.

Dr. N. Pende of Italy reported the results of his studies on the various methods of hormonal therapy. Pende states that the implantation of tablets of crystallized hormone (as restricted to desoxycorticosterone, testosterone, estrone, and progesterone) gives transient results, making it necessary to repeat it several times. Frequently the testosterone tablets are eliminated through the operative wound because of coagulation of the tissues. Tablets of estrogens produce metrorrhagia and the danger of hyperdosification cannot be avoided. The best results of implantation are obtained in cases of Addison's disease, and the most

inconstant results are observed in hypogonadism in men. The speaker stated that the depositing of hormone crystalline suspension offers no advantages over parenteral injections because the velocity and quota of absorption are unknown and in cases of hyperdosage it is not possible to remove a portion of the introduced hormones. The technique of administration of hormonal therapy either by ingestion (preparations of thyroids or of estrogens) or by parenteral route (total extracts or single hormones) is difficult. Frequently the practitioner gives to the patients excessive doses (androgens and estrogens). It is convenient to give small doses to the patients and, especially, to apply topic treatment near the tissues on which the hormones should act (urethra, vagina, breasts, and nasal structures).

Prof. G. Marañón of Spain reported the results of his studies on three problems: (1) the reason for the administration of moderate doses of hormonal therapy, (2) the inconveniences and dangers of the administration of large doses, and (3) the most adequate technique of administration of hormonal therapy. 1. The goal of hormonal therapy is to obtain the maximum results of physiological effects. For these results to be obtained two conditions are necessary, namely, that the dose of hormones administered be of about the same quantity as that of the normal secretion of the glands, and that the time at which the therapy is given be about the same as that at which the given glands are liberating their secretions. The therapy should be given in accordance with the needs of the body and not with an arbitrary schedule. Moderate doses are the most normal. Nearly all the favorable effects that are obtainable from hormonal therapy can be obtained with moderate doses and without therapeutic haste. It is difficult for the physician to discover the exact moment at which the effect of the hormones should be felt, except in certain cases, as in that of insulin in which the time of action is well known. 2. Entirely antiphysiological large doses of hormones may result in the production of unpleasant and harmful effects. In certain instances they may cause hyperfunctional reactions in the corresponding gland, in some other cases they may cause functional changes and even lesions of other endocrine glands, still in other cases they may produce nonspecific and non-glandular pathological disorders, which seem to be due to rupture of the balance of adaptation that the given glandular insufficiency had already created. 3. The most adequate technique for administration of hormonal therapy is the implantation of tablets or the injection of microcrystals, which at the present time should be restricted to a small number of hormones. The reason for the administration of hormones by this technique is that the therapy is of substitution and the effects are similar to the physiological action of the hormones.

Prof. L. de Gennes of Paris discussed hormonal therapy of cancer of the breast. The treatment is palliative and coadjutant when it is resorted to early in the course of the disease, but it does not replace direct surgical treatment or roentgen therapy of the tumor. The speaker stated that hormonal therapy should be administered as complementary treatment, as well as for the prevention of metastasis or else as a palliative measure when metastases have already appeared, in order to slow their growth, diminish pain, and prolong the life of the patient. The effects of ovariectomy on cancer of the breast are better than those of roentgen therapy on the ovary. Ovariectomy diminishes the percentage of recurrences, acts on the bone metastases (especially on the vertebral metastases), and improves the general condition of the patient. The androgens, when administered in large doses, moderately act on the tumor and on the metastases of the soft tissues, but they have energetic effects on the bone metastases and on the pain that these metastases produce. The doses should be large because of the fact that the small doses are almost inactive and are harmful. The estrogens are more active on the tumor of the breast, which may even diminish in size. They are also active on ulcerations, adenopathies and metastases, however, they should be reserved for administration only to old women or to women in well-established menopause. Even in women in these groups the bone metastases are more favorably effected by androgens than by estrogens. Young women with inoperable cancer of the breast should have castration and androgens in massive doses. In men castration and estrogens sometimes give similar results to those obtained in cancer of the prostate, although they are not as constant and dramatic as those observed in

the latter form of cancer. It is difficult to state whether or not the therapy with these hormones has actual prophylactic value and also if the therapy diminishes the number of recurrences when it is given after early operation in cases of cancer of the breast without axillary involvement, however, it seems that preventive androgenic therapy of mastitis prevents cancer transformation in a certain number of cases. Surgical castration improves the prognosis of cancer after late operation, but similar results are obtained from the administration of injections with massive doses of testosterone. The association of both surgical and hormonal therapy gives promising results, although they are not constant and vary with the given case. It is difficult to evaluate the actual effects of hormonal therapy in cancer, which is a disease that is very uncertain and prone to complications of an unpredictable course, the apparent improvement of which is often followed by spontaneous regression of the disease. Hormonal therapy in cancer of the breast is a real improvement, however, the biological mechanism of the improvement of the disease under the effect of the hormones is still unknown. The study of this mechanism will result in the discovery of the origin and course of hormonal cancer.

Radioactive Isotopes—Prof. C. Gil y Gil of Spain reviewed the general subject with a rather pessimistic point of view because of the dangers of improper handling of these substances. The speaker made special reference to the work of American researchers. Radioactive isotopes have not been used very much in Spain.

Prof. A. S. McFarlane of England reported the results of his studies on radioactive isotopes on metabolic conditions, as shown by the results obtained by American researchers. The point of view that the liver is the main organ producing plasmatic proteins is confirmed by the fact that, following the introduction of amino acids marked with radioactive carbon in the arterial blood of the liver of isolated and perfused rats, a normal production of albumin and globulin takes place in the blood. It is observed, by studying the radioactivity of free amino acids and proteins of the plasma of rabbits, that the liver acts rapidly on free amino acids, transforming the greater part of them to plasmatic proteins within two hours, however, if amino acids are introduced in larger quantity to that corresponding to the physiological velocity in the production of proteins, the amino acids in excess are directly oxidized in the tissues. The plasmatic proteins, which are synthesized in the liver in 2 hours, require 12 more hours to diffuse themselves outside of the liver and to reach a uniform concentration in the plasma and in the lymph. Later on, they pass unchanged from the lymph to the cells of the tissues and become slowly oxidized at about the same time they are consumed in the oxidation of the intracellular proteins in the tissues. If an excessive amount of amino acids is given to the tissues, they become stored in the tissues. This period lasts for several weeks, during which time the tissues begin to hydrolyze the excessive amino acids. The proteins of the liquid of ascitis are identical to those of the plasma, and they are in constant equilibrium with the latter through the peritoneal membrane.

Dr. E. E. Pochin of England stated that frequently it is very important to evaluate the distribution of the isotopes in the different parts of the body and to detect them in the organs in which they are stored. He describes the following methods for evaluating the distribution of the isotopes: (1) using a meter for counting the irradiations, which is provided with a lead cylinder for protection and which is very useful in the regulation of the therapy with radioactive gold; (2) using the method used for the treating of hyperthyroidism with radioactive iodine, with a special protected meter; and (3) measuring the outline, which combines some of the advantages of the previously mentioned methods and is of great value in detecting the areas of abnormal concentration of iodine in carcinoma of the thyroids and also for obtaining quantitative tests for the progress of course of the disease.

Dr. M. Tubiana of France discussed the treatment of thyroid diseases by means of radioactive iodine. He reported the results observed in the treatment of 80 patients with hyperthyroidism and 35 patients with cancer of the thyroid. The treatment with radioactive iodine gave excellent results in 75% of the patients with hyperthyroidism. In 55% of the cases the results were obvious after administration of the first dose. The results were incomplete in 11% of the cases and poor in 12% of the

cases. In comparing the clinical results with the doses of radiations given to the patient, the speaker observed that the best results are obtained with a dose varying between 7,000 and 10,000 r, that is a dose of about 0.1 mc of radioactive iodine for every gram of thyroid, as fixed in 24 hours. When rapid results are desired the dose should be greater. This is the case of patients with cardiac diseases in whom the establishment of a lasting hypothyroidism is feared. The speaker did not observe serious accidents, but late accidents may occur. The treatment with radioactive iodine is indicated in all cases of failure and contraindication of surgical treatment, especially in patients with cardiac diseases or with deficiencies, as well as those who cannot stand prolonged chemotherapy and those who refuse to have an operation. The inconveniences and dangers are less, in the majority of the cases, than those of a surgical intervention, however, the speaker advised this treatment only in patients over 35, as there is the possibility of the occurrence of late dangers, which up to now are unknown. The treatment with radioactive iodine is indicated in cases of cancer of the thyroid when the cancerous tissues fix sufficient amounts of iodine. It is necessary to make determinations of iodine and biopsies. Out of a total number of 140 patients with cancer of the thyroid observed by the author the treatment was given to 35 patients, with excellent results in 8 cases. The results of this statistical study show that the number of patients who obtain benefit with this treatment is relatively small.

Dr. J. T. Van der Verff of Holland reported results of the treatment in patients with polycythemia, leukemia, and other disorders of the reticuloendothelial system. The results obtained in the patients observed by the speaker were in disagreement and never curative. A great improvement is observed in patients with polycythemia vera, and the patients enjoy an almost normal life. Radioactive phosphorus, when given with careful observation of the patient and in combination with some other procedures, is of value, although it does not prolong the duration of the span of life of the patient. In some other disorders of the reticuloendothelial system the response of the patients to the treatment varies in different cases. The dangers of radioactive isotopes make it advisable to reserve this treatment only for patients who do not react well to other means.

Dr. P. H. Hahn of the United States discussed the problem of the treatment with radioactive isotopes in tumors and tumoral processes. He considered the use of gold therapy in four different categories: (1) intravenous administration by means of which the reticuloendothelial system is provided with selective irradiation in diffuse diseases of the macrophagic lymphoid system; (2) interstitial use of the colloid; (3) introduction of gold colloids in several cavities of the body; and (4) introduction of gold colloids, sometimes modified, in the tissues or regions of the body. The intravenous administration of manganese and gold colloids is especially efficacious in chronic leukemia. In some cases of Hodgkin's disease the treatment can give palliative results, although they are not definitive. The treatment with interstitial colloidal gold will be very much in use in the near future. It will be resorted to in certain common forms of malignant tumors, such as cervical, mammary, prostatic, testicular, and cranial tumors as well as in other tumors deeply located, as coadjuvant therapy of surgery. At the present time, the intracavitary use of gold colloids is the most popular. The treatment is palliative after surgery. It has been demonstrated that free tumoral cells are susceptible, in experimental conditions, of treatment by means of these procedures. The introduction of protected gold or of protected gold colloids in regions from which tumoral particles are to be eliminated by means of the lymphatic drainage constitutes a potential method of controlling certain types of malignant metastases, especially in cases of carcinoma of the uterus and of bronchial cancer.

The success of this congress constitutes an international homage to Dr. Teófilo Hernandez, professor of therapeutics in the Faculty of Medicine of Madrid for more than 30 years. Dr. Hernandez is the president of the Society of Gastroenterologists of Spain. After the Civil War in Spain, he was politically deprived of his professional activities. He was restituted to his chair by the academic authorities shortly before he reached the age of retirement, according to the law.

CORRESPONDENCE

DIAGNOSTIC USE OF PENTYLENETETRAZOL (METRAZOL) IN ACUTE BARBITURATE POISONING

To the Editor—There is unanimity of opinion that many cases, probably the majority, of acute barbiturate intoxication require only good symptomatic therapy (Koppanyi, T, and Fazekas, J F *Am J M Sc* 224 577, 1952). Numerous pharmacologists and clinicians, however, have demonstrated that, in severe barbiturate poisoning in animals (Tatum, A. L. *Physiol Rev* 19 472, 1939) as well as in humans (Koppanyi, T, and Fazekas, J F *Am J M Sc* 220 559, 1950), certain central analeptics are of lifesaving value. The problem is the selection from the numerous cases of acute barbiturate poisoning of those requiring specific analeptic therapy. The history, barbiturate blood levels, and physical signs cannot always be relied on, in fact, in many instances, the history and blood levels may not be available to the physician and are, sometimes, misleading. Schmidt, in 1945, and Fazekas and Bessman, currently, have noted, in both animals and human beings, a lowered cerebral metabolic rate associated with deep barbiturate coma but not necessarily with light barbiturate anesthesia.

We have introduced the concept that an orientation dose of pentylenetetrazol (Metrazol), when given intravenously to patients with acute barbiturate intoxication, may awaken or cause a return of reflexes in those patients only lightly or

Cerebral Blood Flow and Metabolic Rates Before and After Administration of Pentylenetetrazol

After pentylenetetrazol (17 hr)	68.8	3.0	6.12

* Previously established for normal subjects

moderately depressed. These patients very often show a permanent improvement after a single orientation dose (5 cc of a 10% solution). If no improvement follows such an orientation dose, the patient should be given more intensive therapy.

We have employed the orientation dose of pentylenetetrazol for many years, and it has proved to be an invaluable guide in outlining subsequent therapy. For example, a 48 year-old man had taken an undetermined amount of a barbiturate intending suicide. He was first seen three hours after ingestion of the drug. He was treated symptomatically, pharyngeal airway oxygen, fluids, and penicillin were administered for 24 hours. After the first 24 hours, the house staff became concerned about his condition because he was still without reflexes, he was comatose, and he did not respond to noxious stimuli. Studies of cerebral blood flow and metabolism were undertaken and showed a marked depression of both values. The patient was then given a 10% solution of pentylenetetrazol intravenously at a slow rate. After the injection of 3 cc, the patient's reflexes returned within five minutes, he lifted his head spontaneously and attempted to speak. From the responses obtained, it became obvious that this patient required only symptomatic therapy. Despite the small amount of pentylenetetrazol given he did not relapse into his former comatose state but continued to improve. In three hours he was fully conscious. Seventeen hours later the cerebral blood flow and metabolism were again determined and were found to be normal (see table).

This case is particularly interesting because not only the physical findings but also the cerebral blood flow and metabo-

lism were indicative of deep (barbiturate) depression, although the response to pentylenetetrazol indicated only a light depression. It is, therefore, suggested that the response of a patient to an orientation dose may be an even more reliable index than the cerebral metabolic rate. If an orientation dose of pentylenetetrazol were universally administered in acute barbiturate poisoning, more reliable statistical information could be gained as to the efficacy of central nervous system stimulants in the treatment of human barbiturate intoxication.

OPTIC NEURITIS

To the Editor—With respect to the clinical note in THE JOURNAL, April 18 (page 1403), it is not unusual, in patients with cardiovascular disease, to find both anemia and optic neuritis associated with subacute bacterial endocarditis. For example, Friedberg states "Optic neuritis and even choked disk have been described as toxic manifestations of the disease" (that is bacterial endocarditis) (*Diseases of the Heart*, Philadelphia, W B Saunders Company, 1949, p 791). Kauntze has published a report of seven cases of subacute bacterial endocarditis in which optic neuritis occurred (*Brit Heart J* 9 34, 1947). Statements in "Genetics in Ophthalmology" by Sorsby and "Clinical Neuro-Ophthalmology" by Walsh confirm this fact, described first in the classic paper by Falconer entitled "The Importance of Optic Neuritis and Retinal Hemorrhages in the Diagnosis of Chronic Septic Endocarditis" (*Quart J Med* 3 107, 1910).

The omission of reference to these facts from the clinical note should be called to the attention of clinicians who encounter this condition, since, under the circumstances, it is not possible to ascribe optic neuritis to chloramphenicol or to any other drug, on the contrary, it must be considered one of the possibilities to be looked for and treated as part of the disease entity.

PROTEIN SYNTHESIS AND CORTISONE

To the Editor—In the April 18, 1953, issue of THE JOURNAL, an editorial on protein synthesis and cortisone concludes that the effect of cortisone is that of over all suppression of tissue protein synthesis. It is true that, in effect, this is the net result of the administration of this drug to animals. We feel, however, that there is enough evidence to lend support to the statement "Adrenal cortical secretions accelerate protein catabolism by a direct action on the oxidative enzymes for deaminating amino acids." This action has been demonstrated in vitro with supportive in vivo data (*J Biol Chem* 183 11, 1950) and has been repeatedly confirmed (*Ann Rev Physiol* 15 402, 1953). More recent clinical observations in patients with Addison's disease (*J Clin Endocrinol* 13 429, 1953) have supported this thesis by demonstrating a decreased capacity of these patients to metabolize amino acids administered intravenously.

Footnotes

- 44 No fee for interns and residents of either hospital. No fee for staff members of San

Diego County Hospital \$40 fee for Mercy staff members including physiology course

45 Designed to prepare candidates for the anatomy examination of the American boards of general surgery and the surgical specialties

46 Surgery \$910 00

47 Leading to degree of Master of Medical Science in surgery medicine obstetrics and gynecology anesthesiology otolaryngology, pediatrics radiology and urology

48 Formal basic science course in preparation for specialty board certification

49 Attendance is encouraged from the following individuals

a Medical Corps officers of the Armed Forces on active duty

b Medical Corps officers of the Armed Forces not on active duty

c Physicians from other federal agencies

d Other civilian physicians desiring to attend

50 Application procedure Applications should be forwarded so as to reach the addressees listed below not later than six weeks prior to the opening date of the course

a Applications from Army Medical Corps officers on active duty and full time Civil Service physicians on duty at Army installations will be forwarded to the Office of the Surgeon General Department of the Army Washington 25 D C Attention Personnel Division Career Management Branch

b Applications from Army Reserve Medical Corps officers not currently on active duty will be forwarded through channels to the Army Area Commander

c Applications from National Guard medical officers should be forwarded through channels to the National Guard Bureau Washington 25 D C

d Applications from medical officers from other branches of the Armed Forces should be forwarded through regularly established channels

e All other applications should be forwarded to the Commander of the installation conducting the course

51 Course is designed for attendance by individuals who are board qualified and/or board certified chiefs or assistant chiefs of services and others well advanced in the study of this specialty

52 Course is designed for attendance by individuals partially qualified in the specialty or officers responsible for medical treatment in this specialty

53 Physicians in Cleveland area and Interns and residents no charge Physicians outside Cleveland area \$40 00

54 July 6, July 20 August 3 August 17, September 14 October 12 October 26 November 9, November 30

55 Formal basic science course \$125 00 per quarter \$12 00 per week for short periods

57 Scholarships for tuition available through State Chapters of American Cancer Society in Idaho Montana Oregon and Alaska

58 No fee for interns and residents

59 Military officers no fee

60 Address Dr W M Dabney, Secretary Crystal Springs Miss

61 Registration fee only Full time faculty members of Creighton and University of Nebraska medical schools, residents and interns of Omaha hospitals are guests of the Society without payment of registration fee Senior medical students of Creighton and University of Nebraska medical schools attend all sessions as curricular requirements

62 Certificate of completion of course granted by University of Oklahoma School of Medicine

63 Alumni \$25 00 non alumni \$75 00 students matriculating in Graduate School of Medicine on September 28 1953 \$15 00

64 This course is available only to physicians certified

65 An acceptable thesis leads to the degree of Master of Medical Science Program is specifically designed to accommodate the candidate for specialty board certification Credit for one year in lieu of a hospital residency year will be given by certain specialty boards for this course

66 Colorado Utah New Mexico Montana and Wyoming

67 Open only to physicians who have been formally approved and accepted for training in psychoanalysis by the Admissions Committee of the Los Angeles Institute for Psychoanalysis

68 Formal basic science courses in clinical neurology neuroanatomy neurophysiology neuropathology neuroendocrinology and electroencephalography

69 Preparation for certification by the American Board of Neurology and Psychiatry

70 A special short course designed primarily for staff members of mental institutions Emphasis on neurology

71 Members of State Obstetric and Gynecologic Society no fee

72 Including manikin obstetrics and operative gynecology (cadaver)

73 Includes 1 week course in audiology fee \$100 00

74 Basic course—1 week \$100 00 clinical course—1 week \$75 00

75 Except July and August

76 In preparation for specialty board examination

77 Basic ophthalmology No 488 clinical and pathology No 501 refraction and motor anomalies No 504

78 Including cadaver, eye ear nose and throat and refraction

79 Including cadaver ophthalmology and refraction

80 For four days \$25 00 either part

81 Fully accredited by the American Board of Orthopedic Surgery

82 Designed to aid in meeting the requirements of the examination of the special board in neurological surgery

83 Course approved for board certification

84 \$200 00 per lecture \$15 00 for series of 8 lectures

85 No fee for interns and residents of either hospital No fee for staff members of County Hospital \$300 00 fee for Mercy staff members including anatomy course

86 Registration fee

87 Leading to the Master of Public Health Degree

88 \$300 00 for nonresidents

89 Designed primarily for individuals doing research or teaching in field of public health and preventive medicine

90 Nonmembers pay \$150 per course or a maximum of \$500 No charge for graduate students of radiology and members of the American Roentgen Ray Society

91 July 6 August 8 September 14 September 28 October 12 October 26 November 9 December 7

92 Including cadaver surgery and gynecology 93 Including general surgery, orthopedic surgery and physical medicine

MISCELLANY

THE DISTRIBUTION AND USE OF GAMMA GLOBULIN

Poliomyelitis—Reports by Hammon and his associates (*THE JOURNAL* Oct 25, 1952, and April 11, 1953) are available on the epidemiological studies that form the basis for the use of gamma globulin in the prophylaxis of paralytic poliomyelitis. The children investigated ranged in age from 1 to 11 years and the doses used were 4, 7, or 11 cc, depending on the weight of the child. The average dose approximated 0.14 cc per pound of body weight.

Significant protection was demonstrated from the second through the fifth weeks following injection and diminishing protection was evident from the sixth to the eighth weeks. There was no significant difference in the number of cases of poliomyelitis in the treated and control groups in the week following injection, but there was evidence of mitigation of paralysis in the cases occurring in the children who had received gamma globulin. This evidence is the basis for the conclusion that gamma globulin will be most effective if given shortly before or as soon as possible after infection. It is of no value after clinical symptoms of the disease have become apparent.

Criteria for Diagnosis—It will be noted that the basis for allocation to the states depends on the reported incidence of the disease, with the suggestion that the incidence of paralytic cases may be used as a control in making additional and supplemental allocations.

To insure uniform reporting it has been suggested that physicians and health departments adopt criteria for diagnosis similar to those formulated by the National Conference on Recommended Practices for the Control of Poliomyelitis. Following is an excerpt from the suggested criteria:

Diagnostic criteria of paralytic or non-paralytic poliomyelitis should generally include three or more of the following:

- (1) history compatible with poliomyelitis
- (2) fever
- (3) stiff neck and/or stiff back
- (4) 10 to 500 cells per cc of spinal fluid taken during the acute or early convalescent period of the disease
- (5) spinal fluid protein elevated above normal limits
- (6) demonstrable muscle weakness or paralysis

"Cases which present only (1) history compatible with poliomyelitis, and (2) fever, should be classified as presumptive, (abortive) poliomyelitis.

"Paralytic cases are defined as those in which definite weakness or paralysis has been detected and persisted during at least two examinations made at intervals of at least several hours. Results of an examination for paralysis of muscles of the extremities or trunk may be very unreliable during the period of muscle tenderness or 'spasm'."

Gamma Globulin—Gamma globulin is the name given to one of several fractions of the protein component of human plasma. It is comparable with the product officially known as immune serum globulin. Gamma globulin is prepared commercially by a method involving a series of precipitations with varying concentrations of alcohol under controlled conditions of acidity and low temperature. An average donation of blood (500 cc) yields 7 cc of a 16% solution of gamma globulin. This represents a single recommended dose for the prophylaxis of poliomyelitis in a 50 lb (6 to 7-year-old) child. The production capacity of existing fractionating plants is limited.

Gamma globulin is available as a 16% solution. This solution is opalescent and somewhat viscous, necessitating injection through a no. 18 or 20 needle for quantities required for the prophylaxis of poliomyelitis. Injections should be made intramuscularly, using a separate syringe and needle for each subject. Gamma globulin should never be given by the intravenous route.

The use of separate syringes is recommended because of the danger of contamination of the syringe with blood containing the virus of homologous serum hepatitis. This may occur when one attempts to withdraw blood in order to be certain that the needle point is not in a vein. No instance of hepatitis has been recorded following the use of gamma globulin that has been prepared and administered in the manner described.

Intramuscular injection of gamma globulin is not accompanied by any significant reactions. The danger of local or systemic reactions must, however, be considered if repeated injections are contemplated.

MEDICAL MOTION PICTURES

Food as Children See It: 16 mm. color sound, 18 minutes. Produced in 1952 by and procurable on loan or purchase from General Mills Inc. Film Department 400 Second Ave. S. Minneapolis.

This film pictures a talk by Dr. Miriam E. Lowenberg, head of the department of foods and nutrition, Pennsylvania State College, to mothers of preschool children. The talk is limited to the presentation of food as preschool children see it. It does not attempt to answer all problems concerned with child feeding. The mothers are urged to serve foods from each of the Basic Seven food groups every day. Dr. Lowenberg points out that foods should be colorful, simple, and appealing to the eye. A good variety of foods with an occasional surprise, such as fruit hidden in custard, is preferable. Lots of finger foods are in order for the children of this age. Emphasis is also placed on maintaining a cheerful atmosphere during mealtime. Children should be encouraged to relax just before eating, and mealtime conversation should remain happy and cheerful. The photographic quality is good, however, the sound quality is below average. This motion picture is a good point of departure around which a discussion could be built. It is suitable for showing at well child conferences and in conjunction with preschool mothers' clubs. Pediatricians could see it for giving discussions before clubs.

Personal Hygiene for Boys: 16 mm. color sound showing time 10 minutes. Produced in 1952 by and procurable on purchase (\$100) from Coronet Films 65 E. South Water St. Chicago 1 and on rental from Ideal Pictures Corporation 58 E. South Water St. Chicago 1 or your local film library.

As the title indicates, this is a film covering certain of the personal hygiene aspects of daily living for boys. It emphasizes cleanliness of the skin, hair, nails, and teeth, beginning procedures in shaving, and other similar items. To a lesser degree, pointers are given on exercise, proper diet, and certain safe guards against becoming infected by common diseases. The motivation of the film should appeal strongly to teenage youngsters who desire to present a good appearance and to build strong, healthy bodies. The picture is attractive and well done. The photographic and sound quality are very good. It should be of greatest use at junior and senior high school levels and may have wider application in youth groups and clubs. A study guide is available from the producer.

Personal Health for Girls: 16 mm. color sound showing time 10 minutes. Produced in 1952 by and procurable on purchase (\$100) from Coronet Films 65 E. South Water St. Chicago 1 and on rental from Ideal Pictures Corporation 58 E. South Water St. Chicago 1 or your local film library.

Emphasis is given to cleanliness as a means of maintaining good health and appearance. The film covers such topics as care of the teeth, hair, and skin, proper eating habits, adequate rest, exercise, and the importance of clean clothing. Safeguards against infection are briefly covered, along with the appropriate use of cosmetics and personal hygiene pointers on menstruation. The photographic and sound quality are very good. The film is suitable for persons of junior and senior high school ages. A study guide may be obtained from the producer.

Anticholinergic Drugs and Gastric Secretion.—The effects on gastric secretion in man of six anticholinergic drugs namely, methantheline (Banthine), 'prantal' (N,N, dimethyl-4 piperidylidene-1,1-diphenyl methane methyl sulfate) and four new preparations designated as AP 193 (diethylaminoethyl beta hydroxy alpha phenyl cyclohexane acetate), U 0407 (pyrrolidyl ethyl phenylcyclopentenyl acetate etho-bromide), U-0385 (diphenyl-[2-piperidyl ethyl] acetamide methobromide), and U-0229 (alpha, alpha diphenyl gamma [1-piperidyl] butyramide hydrochloride) were compared. The authors' studies were limited to patients secreting acid gastric juice continuously

under basal conditions. The stomach was aspirated continuously, the contents being collected every 15 minutes, the volume and free acidity were measured for each specimen. Each test was continued for approximately three hours or until the original levels were regained. The effects of the drugs on basal secretion were investigated in a total of 359 experiments, with the compounds administered intramuscularly in 165, orally (by gastric tube) in 176, and intraduodenally in 18. The occurrence and severity of side-effects were estimated by inquiry concerning appropriate symptoms and by the following measurements: output of saliva, degree of mydriasis and the pulse rate and blood pressure. The influence of U 0385 and U-0229 on the nocturnal and the 24 hour secretion was studied in a small group of patients. The continuous gastric secretion before, during and after the intravenous infusion of U 0229 was measured in seven patients with duodenal ulcer. The effects of methantheline, "prantal," U 0407, U 0385 and U-0229 on gastric secretion stimulated with a histamine analogue (3 beta-aminoethylpyrazole) were investigated in 34 experiments. Compounds U 0229, U 0407, methantheline and "prantal," listed in their order of potency, suppressed basal gastric secretion temporarily when given intramuscularly in sufficient amounts. Only U-0229 and U-0385 inhibited the free acidity consistently after oral administration. Compounds U 0407, methantheline and "prantal" decreased gastric acidity only occasionally after oral administration. AP-193 was totally ineffective. The intravenous infusion of 6 to 11 mg of U 0229 induced prolonged anacidity in the majority of a group of patients with duodenal ulcer. Compounds U-0229, U 0385, U-0407, methantheline and "prantal" delayed, but did not suppress, the gastric secretory response to 3 beta aminoethylpyrazole. The three anticholinergic drugs tested, U 0407, U-0385 and U-0229, did not inhibit secretion maximally stimulated with repeated injections of 3 beta aminoethylpyrazole. The frequency and duration of anacidity increased, generally, though not exclusively, in proportion to the incidence and severity of side-effects. The most potent antisecretory compounds, U 0229 and U-0385, produced symptoms such as dryness of the mouth and throat, blurring of vision and delay in urination, more often than less effective compounds.

Effects of Methantheline on Pain and Motility.—The effects of methantheline (Banthine) bromide on the pain of duodenal ulcer and on antral gastric motility in 8 men and 4 women between the ages of 25 and 54 with this disease were studied. In preparation for the study, all patients were fasted from 14 to 16 hours, during which time all medication was stopped. Antral gastric motility was recorded by a balloon photokymographic technique with the patient reclining flat in the supine position on a comfortable bed. Pain was registered on the photokymograph by means of a light signal activated when the patient pressed a small hand switch. After a control period of observation of approximately one hour, methantheline in a dose of 100 mg was administered orally with about 15 cc of tap water. The recording was then continued for approximately another hour. While the complete mechanism for the production of pain of duodenal ulcer is not clear the present study revealed that in those patients with an intermittent type of pain there was a positive correlation between the occurrence of type 2 antral contractions (phasic pressure waves of the gastric antrum) and the subjective evidence of pain. Methantheline was thus found to be an effective agent for inhibiting type 2 antral contractions in patients with duodenal ulcer and produced results similar to those observed previously in a group of patients with duodenal ulcer who had undergone vagotomy.

Mechanism of Pain in Peptic Ulcer.—In studying the mechanism of ulcer pain, at least two factors must be considered, namely, hydrochloric acid and gastric motility. Since both of these are variables, it is impossible to evaluate the effect of either factor upon ulcer pain without controlling the other. In the authors' study the acid values were artificially raised to the high levels usually associated with ulcer pain, by administering orally 200 cc of 0.1 normal hydrochloric acid to 88 patients

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individual subscribers provided they reside in continental United States or Canada. Requests for periodicals should be addressed Library American Medical Association. Periodical files cover only the last 11 years and no photoduplication services are available. No charge is made to members but the fee for other borrowers is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted.

having an active ulcer with typical pain within the preceding 24 to 48 hours. In this manner the role of the remaining variable, motility, could be correctly appraised. In 66 patients 2 oz. (60 gm) of barium sulfate were added to the hydrochloric acid and the patients observed fluoroscopically at frequent intervals for a period of 30 minutes. Determinations of gastric acidity before and after the administration of acid and of the suspension of acid and barium were made in 25 patients. Despite high acid values, only 37 of the 100 "acid tests" performed on the 88 patients produced pain. From this observation alone the concept that hydrochloric acid per se is the cause of ulcer pain can be questioned. On the contrary, the authors' studies indicate that ulcer pain in the uncomplicated case is invariably associated with abnormal motility. Pain appeared with the onset of abnormal motility and ceased when motor function returned to normal. This abnormality consisted of incoordinated activity of the antral evacuation mechanism with or without localized spasm. The 39 patients with negative tests on whom detailed fluoroscopic observations were carried out showed none of these abnormalities. Most of them showed normal motility with prompt evacuation. The remainder had quiet in active stomachs with a patent pylorus, and gastric emptying proceeded normally when the patient was placed in the recumbent right anterior oblique position. The use of drugs affecting motility afforded further opportunity for studying the relationship of ulcer pain and motility. Twenty-six patients were given methantheline or a new cholinergic blocking agent (SKF-1637), with prompt relief of pain in 25. This coincided exactly with cessation of abnormal motility and relaxation of the stomach. From these observations the concept is advanced that abnormal motility is the fundamental mechanism through which ulcer pain is produced. For the production and perception of ulcer pain, there must be (1) a stimulus (hydrochloric acid or others less well understood), (2) an intact motor nerve supply to the stomach and duodenum, (3) altered gastroduodenal motility, and (4) an intact sensory pathway to the cerebral cortex.

Carbon Dioxide Inhalation Therapy of Neuroses.—Over a three year period approximately 6,200 carbon dioxide inhalation treatments were administered to 213 patients with various psychoneurotic conditions. Using an anesthesiologist's gas machine, Moriarty administered a mixture of 30% carbon dioxide and 70% oxygen. The author's method, which represents a modification of Wilcox's technique, permits the patient to reach a deep level of anesthesia without a protracted period of hyperventilation. Usually after 25 to 40 respirations the patient reached a sufficient level of coma, and the mask was then removed, he waked within 40 to 60 seconds after the removal of the mask. The whole inhalation procedure may be administered in approximately five to six minutes. In order to facilitate the therapeutic process, two or more carbon dioxide treatments were administered to many patients during a therapeutic session, allowing about 10 minutes for rest and psychotherapeutic interviewing between the inhalation procedures. Results obtained in the first 66 patients are analyzed in some detail and seem representative of the total group of 213. Of the 66 patients, including seven nosological groups, namely, anxiety neuroses, character neuroses, psychosomatic reactions, alcoholics homosexuals, depressive reactions and conversion hysterics, 26 (39%) were much improved, 28 (43%) were improved, and 12 (18%) were therapeutic failures. The fact that some patients made an excellent response with as few as 8 treatments and others required 70 or 80 treatments before showing a sustained improvement of equal degree indicates the tremendous variability of response to carbon dioxide therapy and emphasizes the need for adequate treatment. As a result of his experience the author states that carbon dioxide inhalation therapy produces favorable effects in many anxiety states and phobic reactions, some character neuroses, certain psychosomatic conditions like spastic colitis and migraine headaches, and some alcoholic problems. It is usually very desirable to utilize psychotherapy in close conjunction with this neurophysiological treatment. The neurophysiological action of the carbon dioxide on the nerve cell is to raise the membrane potential which in turn raises the threshold of stimulation of the nerve, decreases the speed of conduction of impulses, and increases the height and prolongs the duration of the action potential. The central effects of carbon dioxide include a pronounced increase of cerebral blood flow, increase in the respiratory rate and oxygenation of the blood, and a shift of the cortical pH to the acid side. In general, carbon dioxide first inhibits the higher (cortical) centers and releases the lower (brain stem) centers. Secondly, the latter are inhibited in progressive fashion, in reverse order of their phylogenetic development. The healing mechanisms of carbon dioxide therapy are not clearly understood but probably involve a breaking up of pathological reverberating circuits in the nervous system, thereby allowing the homeostatic mechanisms of the organism to take over again. In addition, emotional tensions are released and unconscious material becomes more accessible, facilitating the psychotherapeutic process.

Physiological Effects of Operations for Duodenal Ulcer.—The physiological aim of the surgical treatment of duodenal ulcer is to reduce the digestive power of the gastric juice, but while Wangensteen believes that to accomplish this achlorhydria to stimulation by histamine is desirable, Dragstedt feels that reducing the amount of acid production to within the normal range is sufficient. In evaluating these points of view Smithwick describes the method he uses to determine the gastric acidity of ulcer patients. A Levin tube is placed with the tip at the mid point of the stomach or gastric remnant under fluoroscopic control. Gastric juice is collected for one hour by continuous suction the subject having fasted overnight, this is the basal test. Then 80 cc of peptonized beef broth is introduced into the stomach and aspirated after 20 minutes. The gastric contents are again aspirated for a one hour period, this is the broth test. Fifteen units of insulin are then injected intra-

venously. Blood sugar levels are obtained before and at half hour intervals over a two hour period following the administration of insulin. Gastric juice is aspirated by continuous suction until two one hour samples are obtained. The free acid values for all four one hour specimens are determined by electrometric titration to a pH of 3.5. The pH of each specimen is also recorded. The specimen that contains the largest amount of acid following the injection of insulin is taken as the response to vagal stimulation, this is usually the second of the two one hour specimens. The early physiological effects of various operations for duodenal ulcer were determined according to the described method. Wide variations were found. Recurrent ulceration does not occur if achlorhydria is present in the fasting stomach, following a potent food stimulus and after vagal stimulation as well. The only operations which can be depended upon to consistently produce achlorhydria under these circumstances are those involving resection of at least the distal one half of the stomach together with the vagus nerves. There appears to be a close relationship between the more serious untoward side effects of operations for duodenal ulcer and the size of the gastric remnant. The best clinical results are obtained by patients having the larger gastric remnants. Since the physiological effects of hemigastrectomy combined with resection of the vagus nerves compare favorably with those following operation involving the removal of a larger portion of the stomach, and since the clinical results are superior, this procedure is more likely to supplant subtotal gastrectomy alone than any other procedure studied to date.

Structural Changes Around Nails and Screws in Bones—

The changes taking place around intraosseous stainless steel nails were studied in 12 instances of fractures of the neck of the femur from six days to five years after operation. The entry of the nail shatters a few trabeculae and causes a small amount of hemorrhage within the bone. The repair of this damage leads to the encapsulation of the nail by fibrous tissue, which forms a smooth membranous lining to the nail track. This is well developed in five or six weeks, and new bone appears in the fibrous wall about the same time. Further bone deposition in the fibrous tissue and pre-existing trabeculae forms, in 20 weeks or over, a more or less continuous bony shell around the nail track. This new bone gradually becomes consolidated, and at 2½ years plates of lamellated bone are seen which at five years are endowed with Haversian systems and then resemble true bone cortex, continuous around the lip of the track with the external cortex of the femur and covered by a layer of fibrous tissue continuous with the external periosteum. Stainless steel containing 18% of chromium and 8% of nickel appears to be noncorrodible and inert in human tissues. Screws were used to secure steel plates along the femoral shaft in some of the aforementioned cases in which nails had been used for the fractured femoral neck. The region of the screw holes was examined histologically in two cases 11 days and 5 weeks respectively, after operation. The tissue reaction around the screws seems to resemble that around the three flanged nails, so far as the medullary tissues and the intramedullary course of the screws are concerned. The absence of reaction in the cortical tunnel may be in part explained by the scarcity of vascular connective tissues from which the repair tissue could spring, but also the cortical bone and the cellular tissues within the Haversian canals in

the immediate vicinity of the screw hole are dead, killed no doubt, as Watson Jones stresses, by heat from the high speed mechanical drill used to prepare tracks for screws through compact bone.

Prophylaxis and Therapy of Bishydroxycoumarin Poisoning

—Dalgaard tabulates from the literature 80 deaths from hemorrhage during anticoagulation treatment with bishydroxycoumarin (Dicumarol). The hemorrhage in most serious cases is localized to the regions with pathological changes, and exact diagnosis before the start of anticoagulation treatment is therefore important. The contraindications to the use of bishydroxycoumarin are essentially those laid down by Allen. The treatment has been considered as contraindicated in renal insufficiency, but Sachs has treated nine patients with chronic renal insufficiency with bishydroxycoumarin in ordinary doses without any unusual effect, he warns against the use of bishydroxycoumarin in cases with anuria and in more marked hematuria. The most important contraindication is lack of adequate and reliable laboratory control. Owren's method is recommended for control of bishydroxycoumarin treatment. The dosage must be individualized on the basis of the patient's reaction to a fixed initial dose and must, if necessary, be varied throughout the treatment. The average daily dose for maintenance of prothrombin concentration within the optimal therapeutic limits (between 10 and 20 to 30%) is 50 to 60 mg. Some patients tolerate only about 30 mg daily, others, more resistant, tolerate up to 125 mg daily. Bishydroxycoumarin treatment has hitherto largely been carried out as an intermittent treatment, with relatively large doses at intervals of a day or possibly several days, a more even effect is reached by small doses given daily. In simple vitamin K deficiency, as in obstructive jaundice and in hemorrhagic diathesis in the newborn about 5 mg of menadione bisulfite is sufficient. It is thought that vitamin K₁ should be applied in all cases where the prothrombin activity is to be increased as rapidly as possible, but where it is desirable to increase the prothrombin activity only to the therapeutic level the synthetic preparations are preferable. A single dose of 500 mg vitamin K₁ given orally acts almost as rapidly and effectively as the same dose intravenously except in patients who vomit or have gall-bladder fistula or gallbladder drainage. Blood transfusion is of some value but seldom necessary unless there has been massive hemorrhage, when the purpose is rather to compensate for the blood lost than for the prothrombin.

Physiology of Organism Subjected to Deep Cooling.—As a result of his experiments performed on rats, the author states that it is possible to cool a homohermal animal by placing it in an air tight jar, which then is immersed in ice-cold water, i.e., by withdrawing from the animal more heat than it can produce in its extreme fight against the cold. The term "direct forcing by external cold" is used to describe this technique. When the oxygen pressure of the inhaled air is reduced below a certain value, the intensity of the intraorganic combustion becomes a dependent variable of this pressure, below a certain preliminary pressure, hypothermia runs an equal course with the depression. The atmosphere in the air tight jar grows poorer

and poorer in oxygen, whereas it gets richer in carbon dioxide. Under the effect of the resulting hypoxia and hypercapnia, the closed in animal grows gradually colder and within one and a half to two hours its rectal temperature drops to 15 C (59 F). At this stage the animal is thoroughly anesthetized. It has become a poikilothermal, because it does not show any tendency to increase its temperature when it is placed again in the open air at an external temperature of 15 C (59 F). The animal is able to live for 20 hours in this condition of experimental poikilothermism, a true physical anesthesia, which has been used currently for physiological operative experiments. Due to the low blood pressure there is very little bleeding and the risk of asphyxia is considerably diminished. The animals whose temperature had been reduced to 15 C recovered completely by external warming even after several hours of poikilothermism. There were no immediate or late undesirable side-effects. Cooling for one hour could be repeated 20 times in the course of one month. Three stages were distinguished in the course of cooling as follows: the initial stage of hypothermia during which the animal's temperature is not lower than 20 C (68 F) and there is excess oxidation, the second phase of cooling, for which the term experimental poikilothermism has been coined, occurring between body temperatures of 20 C and 15 C (in this phase the rat resembles the frog in its reaction to hypothermia), the third stage of physical anesthesia is reached at a temperature of about 15 C. If the cooling is continued below 15 C, first respiration ceases (stage of apparent death), and if the temperature is still further reduced below 8 C (46.4 F), the heart ceases to beat. Observations on hibernating mammals such as the spermophilus (a genus of marmots) suggest that the result of deep cooling in homothermal animals which were thus transformed by the author into poikilothermal animals should be distinguished from the dormant state in which hibernating mammals pass the winter. The hibernating animal is able to warm itself automatically by its own means if the cooling becomes too deep and is then able to offer resistance to temperatures much lower than those that have provoked hibernation. Cooling and warming are active physiological phenomena in the hibernating mammal, but passive phenomena in the author's experimental animals. Despite the fact that deep cooling has been artificial and experimental, it is to be considered as a physiological condition observed in the course of phylogenesis as well as of ontogenesis.

Problem of Proteinuria and Its Differential Diagnostic Significance F Lasch—p 153

Criteria of Success of Treatment in Pulmonary Tuberculosis

—According to Rotach, results of chemotherapy in pulmonary tuberculosis should be evaluated on the basis of the roentgenologic aspect rather than on single clinical symptoms. Improvement in clinical symptoms frequently may not be accompanied by a parallel morphological regression in the roentgenologic picture. Subjective well being, increase in body weight, drop in erythrocyte sedimentation rate and decreased amount of sputum may occur fairly regularly under chemotherapy, but should not be considered as a decisive turning point to recovery in the individual case. The disappearance of *Mycobacterium tuberculosis* from the sputum also is a questionable criterion for the evaluation of the effect of chemotherapy, because disappearance of the bacilli may frequently result from chemotherapy while cavities may remain unchanged. Closure of the lesions can be proved only by negative bacteriological findings and by the simultaneous disappearance of the cavities under thorough roentgenologic control. Cavity closure can be demonstrated by tomography only. Regression of pericavernous infiltration and breaking down of caseous masses in the wall of the cavity may be the results of chemotherapy, thus the formerly clearly visible, circumvallate cavity is changed into a cystic formation with soft walls, which does not render any characteristic shadows on general roentgenologic examination. It is only on tomographic

examination that one can decide whether or not closure of the cavity has occurred. Thus medical treatment by the family physician has its definite limitations. Chemotherapy as it is practiced today may in many cases favor the establishment of favorable conditions for recovery, but a sterilization of foci does not result even if the employed drug proves bactericidal *in vitro*. An anatomic cure of tuberculosis, therefore, cannot result from chemotherapy alone. Collapse therapy, which may frequently be combined with chemotherapy in order to be successful, also creates only better conditions for a cure of tuberculosis. The final course of the tuberculosis depends on the defense powers of the organism, and open air treatment at a sanatorium, therefore, remains the basic method, which should not be neglected in favor of active purely medical or surgical treatment.

*Diabetes Mellitus Cured by Laennec's Cirrhosis J. Caroll J. Etévé and J. Bertrand—p 607

Diabetes Mellitus Cured by Laennec's Cirrhosis.—According to Caroll and co-workers, the primary role of the diseased liver in the pathogenesis of diabetes mellitus in man has not yet been clinically demonstrated. The occurrence of cirrhosis of the liver associated with ascites is reported in three men, aged 72, 65, and 62, respectively, with diabetes mellitus of more than 10 years' duration. Two of the patients were alcoholics and that suggested the alcoholic origin of the cirrhosis, while the cirrhosis in the third patient was probably secondary to virus hepatitis. Pronounced hyperglycemia as well as glycosuria in the first two patients and hyperglycemia in the absence of glycosuria in the third patient were considerably improved in the course of the cirrhosis. Hyperglycemia did not recur in these patients despite considerable improvement in the ascites as a result of fractional and repeated tapping and a diet containing large amounts of carbohydrates. These observations as well as others collected from the literature suggest that the improvement of diabetes mellitus in the course of an atrophic cirrhosis, mostly due to an inadequate diet in heavy drinkers, is not due to incidental dietetic restrictions in carbohydrates, since it persists despite a high caloric diet rich in carbohydrates. The antidiabetic effect of destruction or removal of liver tissue is further shown by the fact that (1) removal of the liver in animals at the time of pancreatectomy prevents completely the hyperglycemia that would normally occur after pancreatectomy, and (2) removal of the liver subsequent to pancreatectomy causes a sharp drop in the elevated blood sugar. Hyperglycemia and glycosuria can be artificially produced by cortisone, but thus cortisone diabetes does not develop after hepatectomy. The first of the authors' three patients remained in good condition for two years in response to repeated fractional tapping, but within 14 days after the last tapping a pneumococcus peritonitis caused his death. Necropsy revealed that the improvement in the patient's diabetes mellitus was not due to a pronounced decrease in the amount of functional parenchyma, since the lobular parenchyma was fairly well preserved despite annular cirrhosis. Pronounced hyperplasia of the islands of Langerhans involving mainly the beta cells and the observation of a small chromophobe adenoma of the pituitary strongly suggested that the improvement of the diabetes mellitus was related to secondary changes in the endocrine glands and particularly to the hyperplasia of the Langerhans' islands.

BOOK REVIEWS

Diseases of Metabolism Detailed Methods of Diagnosis and Treatment. Edited by Garfield G. Duncan, M.D., Director of Medical Division, Pennsylvania Hospital, Philadelphia. With contributions by Walter Bauer et al. Third edition. Cloth. \$15. Pp. 1179, with illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5, 7 Grape St., Shaftesbury Ave., London W.C.2. 1952.

This is a critical appraisal of present knowledge of metabolic processes. The general policy of dealing first with normal and pathological physiology and then with clinical aspects has been maintained in this third edition. The chapters on carbohydrate metabolism, water balance in health and disease, malnutrition, disorders of the thyroid gland, and diabetes in children have been rewritten. The chapter on diabetes has been revised considerably, and much has been added to the chapter on vitamins and avitaminosis. A chapter on porphyrin metabolism has been added. Several chapters, such as the introductory chapter and that on obesity, have been condensed without any apparent loss of value.

The frequent mention of corticotropin (ACTH) and cortisone in the various chapters is evidence of the wide use of these agents. The development of radioactive iodine as a therapeutic and diagnostic agent in evaluating disorders of the thyroid gland has been considered in detail. The importance of the isotope technique in furthering understanding of physiological processes is emphasized. Particular attention has been given to the uses of the various types of insulin, especially the relatively new, modified protamine zinc insulin, in the therapy of diabetes. The use of folic acid and vitamin B₁₂ in the problems of primary anemia and the value of vitamin B₁₂ in correcting diabetic neuropathies are emphasized. The author allows overlapping of subject material in the chapters on water balance, mineral metabolism, and kidney diseases. Considering the nature of the three subjects, this duplication seems to be wise.

The author and his collaborators have attempted to bridge the gap between the investigator and the practicing physician, and the clinical aspects have been dealt with in fairly comprehensive detail. A discussion of the present status of trace minerals in relation to diseases of metabolism would have been of interest, inasmuch as the general practitioner is flooded with literature by the pharmaceutical houses and others who are incorporating trace minerals in vitamin and mineral supplements. The book should be of interest and of value to any student, investigator, or physician interested in diseases of metabolism.

Unipolar Lead Electrocardiography and Vectorcardiography, Including the Standard Leads, the aV and V Leads, the Cardiac Arrhythmias and the Principles of Vectorcardiography. By Emanuel Goldberger, M.D., F.A.C.P., Associate Attending Physician, Montefiore Hospital, New York. Third edition. Cloth. \$10. Pp. 601, with 312 illustrations. Lea & Febiger, 600 S. Washington Sq., Philadelphia 6. 1953.

The third edition of this widely read textbook is now about three times its original size owing to revisions and additions in the text, and new diagrams and illustrations. An entire section on vectorcardiography has been added, dealing with various methods of obtaining a vectorcardiogram, or deriving it from a routine electrocardiographic tracing. The author includes for the first time his own views on the theoretical aspects of vectorcardiography and describes normal and abnormal vectorcardiographic patterns in correlation with the principles of unipolar electrocardiography introduced in previous editions of the book.

In the sections on clinical aspects of electrocardiography, ventricular strain now fills a complete chapter. A distinction is made between patterns of ventricular strain and those indicating ventricular hypertrophy, and a pattern of acute right heart strain is distinguished from that of acute cor pulmonale. Various clinical conditions associated with electrolyte imbalance,

especially hypopotassemia, are described at great length, and the respective electrocardiographic alterations are illustrated. Their importance appears overemphasized when compared with the small amount of attention given to other electrocardiographic abnormalities, such as atypical patterns in myocardial infarction, encountered more often in practice. Considering the additions to the discussion of contour changes, and the many pages and illustrations devoted to detailed description of intricate electrical positions, the section on cardiac arrhythmias is too brief. The author has accepted without hesitation Prinzmetal's views on the mechanisms of auricular arrhythmias. Aberrant ventricular conduction is hardly mentioned in the description of premature beats and in the differential diagnosis of ventricular tachycardia, and the concept of sinoauricular block is completely omitted. The statement that quinidine usually slows the ventricular rate in auricular flutter and the reason given for this contradict all previous experimental and clinical observations.

While the typography of the book is excellent, the technical quality of the numerous illustrations is often poor, especially in some of the new additions. The bibliography is not up-to-date. The book is far too complex for the beginner in electrocardiography and the general practitioner, and is a disappointment for the cardiologist interested in clinical electrocardiography.

Clinical Electrocardiography in Children. By Gertrude H. B. Nicolson, M.D., Associate in Cardiology, Chief of Children's Cardiac Clinic and Assistant Visiting Physician to Children's Service at St. Luke's Hospital, New York. Cloth. \$3.25. Pp. 118, with 59 illustrations. The Macmillan Company, 60 Fifth Ave., New York 11. 1953.

The author has not been successful in her stated endeavor "to answer the growing need for a concise and comprehensive work on the subject of the electrocardiogram in the child in health and disease." This is partly because observation of five hundred children is certainly not sufficient basis for such a study. In addition, this material is worked out in a rather superficial way. An extensive discussion and illustration of the changing electrocardiographic pattern in early childhood and in the normal adolescent would be more appropriate than a description of single waves in single leads and of the various electrical positions. Similarly, incomplete and frequently erroneous diagnostic criteria for abnormalities relatively rare in childhood, like myocardial infarction, bundle branch block, and some disturbances of rhythm, are beyond the scope of the book and are dealt with in any text on electrocardiography. The best part of the book is the chapter on congenital heart disease. Unfortunately, here, as in other chapters dealing with abnormalities of the child's electrocardiogram, the poor technical quality of the material, obvious misinterpretations and loose terminology in the legends and text, as well as five different tables of normal rates and P-R intervals, contribute to the reader's confusion.

The Microbiological Assay of the Vitamin B-Complex and Amino Acids. By E. C. Barton-Wright, D.Sc., F.R.I.C. Cloth. \$4. Pp. 179, with 25 illustrations. Pitman Publishing Corporation, 2-6 W. 45th St., New York 36. Sir Isaac Pitman & Sons Ltd., Pitman House, 39-41 Parker St., Kingsway, London W.C.2. 1952.

This text is English writing at its best. It is clear, simple, thorough, well organized, adequately illustrated, and fully indexed. The work will be doubly welcome to the beginner, because it collects the widely scattered literature, and because it gives detailed directions for each step in each assay. In covering the analyses of 10 B vitamins and 18 amino acids, the author purposely omits vitamin B₁₂, since no published method is considered fully reliable and in most of these only very small volumes of solution of amino acids are used, these techniques are unsuitable for the beginner. Although the book is an introductory text, most workers in the field should read it, particularly the general sections.

TO THE EDITOR—A young mother has consulted me about terminating her present third pregnancy. Both previous pregnancies resulted in mentally defective children, the condition in each being diagnosed as probable cerebellar ataxia with mixed dominance. Birth trauma as a causative factor seems unlikely. The physician who attended the woman claims that both deliveries were normal in all respects. In the background of neither mate is there a known similar case. The couple has decided to have the pregnancy interrupted. I am inclined to agree. If this is due to a genetic abnormality, future pregnancies will carry a similar risk. I feel that one parent should be sterilized. What is your opinion?

Domonic Pellillo, M.D. Tucson, Ariz.

ANSWER.—The actual causes of congenital mental deficiencies are not known, with few exceptions, such as rubella during the first three months of gestation, erythroblastosis, and radiation treatment during early pregnancy. D. P. Murphy (Congenital Malformations: A Study of Parental Characteristics with Special Reference to the Reproductive Process, ed. 2, Philadelphia, J. B. Lippincott Company, 1947) has shown that recurrence of monstrous children is common. In general, the parents of a congenitally malformed child are about 25 times more likely to produce another defective child than are parents whose children are all normally developed. Furthermore, if two children in a family exhibit congenital defects, there is a 50% chance that the same defect will reappear in a subsequently born brother or sister. In view of the fact that there is at least a 50% chance that a third child will be abnormal, interruption of pregnancy may be justifiable, however, consultation with another physician must be had before the uterus is emptied. Likewise, the question of sterilization in such a case may be considered. Certainly if this pregnancy is permitted to continue and a third defective child is born, sterilization should be carried out on either the husband or the wife. It is far simpler to sterilize the male than the female. Whether this should be done now is debatable, but perhaps it is justifiable. It must be remembered that statistically the baby in utero has almost a 50% chance of being normal.

TO THE EDITOR—Please advise me concerning pregnancy in a postpoliomyelitic patient with reference to management of the antenatal course and choice of anesthetic for delivery. There is paralysis of both lower extremities but the patient is ambulant on braces. The circulatory pattern in the legs is poor. There is continence of the urine and feces. The patient's general condition is excellent.

Gene S. Pierce, M.D., New Albany, Ind.

ANSWER.—There are many recorded cases of normal labor occurring in women with complete or partial transection of the spinal cord. In general, it may be said that spinal cord lesions do not interfere with the normal activity of the uterus in labor nor do they affect its normal growth in pregnancy. Therefore, in a patient who is postpoliomyelitic, irrespective of the extent of disability, there should be no difficulty from this source either in the course of pregnancy or in the pattern of labor. Prenatal care should consist only of the ordinary routine precautions, with particular attention to adequate rest and nutrition and avoidance of excessive weight gain. If physio-

therapy is being employed, measures permissible during pregnancy include hydrotherapy and active and passive exercises. Massage should be avoided. Labor may be conducted along entirely orthodox lines. Spinal anesthesia is interdicted in a patient who has had any central nervous system lesion or back injury and, therefore, should not be used in this patient. The same is true of caudal anesthesia. Inhalation or local anesthesia is entirely permissible.

TO THE EDITOR—It is customary in some urological departments to test sensitivity to intravenous contrast materials by placing a drop of the solution in the conjunctival sac. In the event the patient is highly sensitive, can the resulting reaction cause ocular damage? If so, what is the antidote or treatment?

M.D., New York

ANSWER.—Although patients do not often show an alarming degree of iodine sensitivity during excretory urography, the possibility of such reaction must be considered. A history of allergy should make a preliminary test imperative. Tests for sensitivity to iodine may be either oral, cutaneous, or conjunctival. The latter test, because of its simplicity, has been used more frequently. Care should be taken that the iodine solution is administered with aseptic precautions. In case there is a severe conjunctival reaction, it can usually be controlled by instilling a few drops of a 0.5% solution of cortisone. As a precautionary measure, a small amount of the contrast medium may be slowly injected intravenously and, after pausing for a few minutes, the injection may be completed. It has been claimed that a preliminary dose of acetylsalicylic acid may have prophylactic value.

TO THE EDITOR—I would appreciate your opinion regarding medical treatment of acute glaucoma in a 60-year-old debilitated woman, who has had diabetes for 20 years. The eye is blind with the pupil in mid-dilatation, and rubeosis iridis and retinopathy are present.

M.D., New York

ANSWER.—The secondary glaucoma caused by rubeosis iridis constitutes the most difficult problem in the management of glaucomas. There is no medical treatment of value, the pain caused by the condition commonly leads to enucleation, which is the procedure preferred. Palliative surgical therapy, such as cycloclathery, may be useful in controlling pain and perhaps intraocular pressure but will not restore vision. The retrobulbar injection of alcohol may also be of some value in relieving pain. If the eye is not painful, no treatment is indicated.

TO THE EDITOR—For two years I have had as a patient a 32-year-old white man with progressive muscular dystrophy. He has been given therapeutic doses of vitamin B complex and vitamin C and, also, up to 40 mg of vitamin E daily, with fair results. Is there any more promising therapy?

Joseph G. Varkol, M.D., Clifton, N. J.

ANSWER.—Progressive muscular dystrophy is a disease usually beginning early in life. It occurs more frequently in males, the ratio being about 5 to 1. The disease rarely begins after 20 years of age. Often, several members of a family are affected. Progress is gradual, and the patient is usually finally bedridden. Prognosis is poor if the respiratory muscles become involved. Treatment consists of palliative measures. Favorable results to some degree have been reported with the use of vitamins, especially vitamin E, but their value is not established. There is marked loss of muscle power and tone in this

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

disease, however, mild massage with passive resistive exercises is helpful in most cases. Inactivity and muscle disuse should be discouraged, but muscular exertion should be avoided. Back braces are of value in patients in whom scoliosis and lordosis are becoming marked. Other orthopedic appliances are useful at times. Recently, adenosine-5 monophosphate has been used, with reported success. Theoretically, this drug stimulates muscle regeneration, and it is worthy of a thorough trial in progressive muscular dystrophy. The suggested dose is 25 mg in a gelatin base given intramuscularly daily for five days and thereafter about three times a week. Later, frequency of administration may be reduced to once or twice a week.

OCULOMOTOR PARALYSIS IN A DIABETIC

TO THE EDITOR—A 55-year-old man, a diabetic for many years, had an accident in which the scalp was lacerated and he momentarily "blacked out." A few days later double vision, drooping of the eyelid, and paralysis of the internal rectus developed. Is it possible that the blow to the head produced a lesion around the nucleus of the third nerve that became evident a few days later? Would it be proper to utilize vitamin B₁₂ on the assumption that the patient has diabetic neuritis? Max J. Schroeder, M.D., New York

ANSWER—It is impossible from the limited information given to answer this question with any degree of certainty, however, it is unlikely that a patient who sustained a blow to the head causing a laceration of the scalp and only a momentary "black-out" would, as a result, sustain a sufficiently severe injury to cause partial paralysis of the third cranial nerve a few days later with no other symptoms. Admittedly, a minor blow to the head could produce a subdural hematoma, which might result in a third nerve palsy, but if this occurred, there would certainly be other symptoms that are not listed. On the other hand, it is well known that diabetics, especially those with arteriosclerosis, often have involvement of one of the nerves to the extraocular muscles, either the third, fourth, or sixth cranial nerves. It would seem more likely that this patient had involvement of the third cranial nerve on that basis rather than as a result of this relatively minor injury. There would be no objection to the administration of vitamin B₁₂ in this case but no assurance that this or any other form of therapy would prove beneficial. Involvement of the ocular motor nerves as the result of diabetes and arteriosclerosis is often temporary, and the condition frequently improves spontaneously.

CAST OF THE COLON

TO THE EDITOR—A 38-year-old, apparently healthy woman had abdominal discomfort and then evacuated what appeared to be a solid cast of the inner outline of the colon. A competent pathologist analyzed the cast carefully and concluded that it was composed of necrotic tissue. Are there references in the literature to similar instances?

Max J. Schroeder, M.D., New York

ANSWER—Granting that the material passed had its source in colonic tissue, the case is unusual, owing to the mildness of the symptoms and apparent good health of the patient. Under the circumstances, one would expect the material to be the familiar mucus cast seen in patients with mucous colitis. A coating of decomposed meat tissue and other food materials on such casts could give the appearance of necrotic tissue. The medical literature of recent years cites no case report of similar nature. Volume 7 (1886) of the Index Catalogue of the Library of the Surgeon General's office, United States Army, contains numerous references to articles on intestinal concretions and casts, but the cases reported, mostly of foreign origin, apparently are not identical to the one under consideration. Later articles dealing with membranous enteritis, enterocolitis and colitis, pseudomembranous enteritis, and necrotic and ulcerous enteritis and jejunitis, all conditions in which shreds of membrane may be passed in the stool, are invariably characterized by a stormy clinical course, sometimes with fatal

termination. In Gould's and Pyles' text, *Anomalies and Curiosities of Medicine* (New York, Sydenham, Publishers, 1901, p. 643), a case is described in which a slough of the intestine followed intussusception.

VINCENT'S INFECTION

TO THE EDITOR—What is the simplest or most efficient office procedure for staining a smear for diagnosis of Vincent's infection?

Harry L. Parker, M.D., Lockport, N. Y.

ANSWER—The simplest procedure is staining with methylrosaniline chloride (gentian violet), however, the stained smear alone is no longer considered diagnostic, since Vincent's spirochetes (*Borrelia vincenti*) and the fusiform organisms are normal inhabitants of the mouth. Pain, foul odor, and sloughing of the gingival tissues are characteristic signs of so-called Vincent's infection.

RAZORS AND HOMOLOGOUS SERUM HEPATITIS

TO THE EDITOR—My attention has been called to the query that appeared in THE JOURNAL Jan. 10, 1953, page 166, concerning "Razors and Homologous Serum Hepatitis." While it is true that the virus of serum hepatitis can be inactivated by ultraviolet light, recent work conducted by this laboratory, which is shortly to be published, has demonstrated that the levels of ultraviolet energy required to accomplish this are much higher than had previously been believed necessary. General statements that the virus of serum hepatitis can be inactivated by ultraviolet irradiation should therefore be made with caution and reservation. There is no evidence that the usual germicidal solutions can be relied on; in fact, what little evidence there is indicates that cresol, phenol, ether, and thimerosal (Merthiolate) are ineffective. The statement "Water sterilization at 60 to 80 C for one or two hours will kill the virus" is not in keeping with our experience with the effect of heat on the agent. As reported in a paper read before the American Public Health Association in Cleveland, Oct. 23, 1952 (abstracted, Pub. Health Rep. 68:131, 1953), heating plasma containing the virus of serum hepatitis for 4 hours at 60 C was found ineffective. The "Minimum Requirements for Citrated Whole Blood" issued by the National Institutes of Health (ed. 3, Feb. 19, 1953) stipulates that apparatus and instruments capable of transmitting serum hepatitis from one person to another be heat-sterilized and contains the following statement: "Heat sterilization shall be by autoclaving for 30 minutes at 121.5° C (15 lb. pressure), by dry heat for 2 hours at 170° C, or by boiling in water for 30 minutes." This is severe treatment for sharp cutting instruments, such as razors, but to recommend anything less stringent would be unwise.

NECROSIS OF THE FEMORAL HEAD

TO THE EDITOR—In THE JOURNAL, March 7, 1953, page 874, I note a query about the best method for treating necrosis of the femoral head following a fracture of the hip. The answer is categorical with respect to the use of the prosthetic heads. An accumulating experience in the use of these does not seem to justify the hopes that were originally held out for them. More and more cases of failure are being seen not only in arthritic patients but also in postfracture patients. After such failures, I have used the resection angulation operation as a two stage procedure (Surgery 13:55, 1943) and, since 1945, as a one stage procedure (Bull. Hosp. Joint Dis. 9:187, 1948). The results of a follow up study of about 50 of these patients indicate a higher percentage of satisfactory results than are obtained with the other methods (New York State J. Med., 53:1201, 1953).

MEDICINE TODAY—ITS AIMS AND RESPONSIBILITIES

Edgar V. Allen, M.D., Rochester, Minn.

When I began preparation of this paper I had only general ideas, for I was requested to present a non-scientific essay. I know now that generalities tend to remain amorphous and that to cause them to crystallize in lucid exposition may require a great deal of additional thought. Also, I have some perturbation about the result I have achieved. I know that in this audience are persons whose qualifications for the sort of address I was asked to make equal or exceed mine. Moreover, as I read what I had written when it was too late to make changes, I wondered if some of my words would be interpreted in Milwaukee as accusation. I assure you that is not my intention. In Milwaukee, I am fully aware, my voice is not crying in a wilderness. But there are remnants of wilderness in the land, and where but in a place of enlightenment such as this would it be more likely to be useful to urge the true disciples of medicine to missionary zeal?

MY CREDO

I believe in the profession of medicine. I am thankful for that improbable chance that, in an earlier day, took me out of a school of engineering into premedical study. I would rather be of the physician's guild than a follower of any other occupation of which I know. I believe that no profession offers better opportunity for growth in moral and ethical stature, for contribution to the welfare of society, and for relief of individual human suffering. I believe that no profession permits the practitioner to approach so closely the goals of kindness, loyalty, devotion, and consecration as does medicine. If I find, as you must, flaws in the wide surface of the portrait that represents us, I believe them to constitute only a challenge to us to strive more diligently toward perfection.

ACCOMPLISHMENTS OF MEDICINE

Much of what has been accomplished in the past 30 years, the "Golden Age of Medicine," has been the outgrowth of mental and emotional attitudes of practitioners and scientists toward their chosen work. If, in amplification of what has been said, a few of you note that fragments have been taken from something I said elsewhere,

perhaps you will have the goodness to consider them pertinent to the present occasion. Mark Akenside, a physician, thought of science as the "pure delight." A portion of his work, "The Pleasures of Imagination," published in 1744, reads as follows:

Speak, ye, the pure delight, whose favored steps
The lamp of science thro' the jealous maze
Of nature guides, when haply you reveal
Her secret honors

To scientists dedicated to the "pure delight," and to practitioners who have interpreted the results of laboratory investigation for the benefit of the sick, all are indebted for this Golden Age. The investigator and the practitioner occupy the bright foreground of a dark canvas. They are, in my estimation, the most favored of all in the scope of human endeavor. I do not wish to detract from the tribute paid the Royal Air Force by Winston Churchill, when he said, "Never in the field of human conflict was so much owed by so many to so few." In the long view of history, however, this fine Churchillian phrase, in my estimation, can be applied even more aptly to all whose primary aim has been relief of human illness. If in passing I note that we, the practitioners of medicine, take undue credit for what has been done, forgetting that we have done little more than apply what others have discovered, I need only recall the omnipresence of human frailty.

I shall not document in detail the accomplishments of medical science and medical practice that have made this the Golden Age. Anyone can identify them by reading the edition of Osler's textbook published in 1918 and noting the contrast between medical skill and knowledge then and now. Suffice it to say here that the time from cradle to grave has increased from fifty years in 1900 to almost three score and ten in 1952. The percentage of the population older than 65 years has doubled in the same period.

"Man that is born of woman is of a few days and full of trouble," wrote the unknown author of the Book of Job, but man that is born of woman today is of many

From the Division of Medicine, Mayo Clinic.
Read before the Milwaukee Academy of Medicine, Milwaukee, Jan. 20, 1953, and before the Ogden Surgical Society, Ogden, Utah, May 21, 1953, under the title "Apples Don't Fall Far from the Tree."

days That he is full of trouble is the endowment of a world of despair, doubt, and angry disillusionment The contribution of physicians to this world is prevailingly to improve it, however, the harsh facts are that a substantial portion of the population is dissatisfied with the kind of medical care it is getting and with the cost of it Consequently, not impulsive opposition but soul-searching tolerance and leadership will be required of medicine if it wishes to guard the public health against those who are willing to trade the much that has been accomplished in matters of health for an uncertain pig in a socialistic poke

DEFICIENCIES WITHIN THE PROFESSION

Earlier in this presentation I accounted for any carping of mine, and now, in further defense of what I am about to say, please recall the epigram attributed to Abraham Lincoln "To accept by silence, when they should protest, makes cowards of men" I need not furnish to this audience evidence that occasionally treatment is for fee rather than for patient welfare If great literature portrays life, probably hundreds of examples of destruction of character by cupidity or uncontrolled ambition can be cited One that seems appropriate to quote at this time, because of the stir the work currently is making, is found in Coghill's translation of "The Canterbury Tales" In "The Pardoner's Tale," three young roisterers are represented as looking for Death They seize an old man and mockingly demand that he tell them where Death can be found He assures them that he has seen Death that very day, down the road, under an oak tree With drunken bravado, they march to the tree and find, to their amazed delight, a pile of gold florins But the old man was right, too Since the three decided they cannot haul their treasure home in daylight, they send the youngest back to town for bread and wine to sustain them until night No sooner is he gone than one of the other two proposes treachery

Now look, when he comes back, get up in fun
And have a wrestle with him, just a rag,
Then I'll jump up and slice him through the bag
While he is struggling, thinking it a game,
You draw your dagger too and do the same
Then all this money will be ours to spend

But the youngest, on his way to town, had similar thoughts and poisoned two of the three bottles of wine he bought Chaucer continued

Why make a sermon of it? Why waste breath?
Exactly in the way they'd planned his death
They fell on him and slew him, two to one
Then said the first of them when this was done,
Now for a drink Sit down and let's be merry
For later on there'll be the corpse to bury"
And, so it happened, reaching for a sup
He took a bottle full of poison up
And drank, and his companion, nothing loth,
Drank from it also, and they perished both

Of course, I do not mean to suggest that a physician in his right mind will commit murder for gain The urge to acquire may adversely affect one's work, however, and if we would combat deterioration of that nature, we must begin with acceptance of the fact that, sometimes, medical practice is dishonest, incapable, unethical, and too costly The time has passed when we can condone needless operations and prolonged treatment for ills

that do not exist because the physician does not know any better One so ignorant when all about him is the opportunity to learn and one who refuses to call for consultation when it is within reach is not qualified to practice medicine Such conditions could not exist if were it not for our reluctance to discipline those within our own profession Basking in the sunshine of prosperity, we are, to this extent, untrue to the ethics of medicine through negligence We must, in fact, be our brother's keeper

The law, justifiably trustful of the standards of our guild, is lenient Hence, our diplomas and our certificates of licensure to practice permit us a large measure of self-government, only in cases of gross negligence and overt malpractice does the law step in I do not recommend periodic evaluation of individual competence either by ourselves or by the state, but I do insist that we maintain our standards Those who deviate from practices that are vital to our profession must turn from their waywardness or get out of medicine

MEDICAL PRACTICE AND SOCIETY

It is no news to you that medical practice, as contrasted with medical science, has been and is under vigorous attack by many of our fellow citizens This is not without benefit to us, a kite rises only against the wind Are all who oppose us politically ambitious, personally selfish, or desirous of power? We would be devoid of vision and thoughtful consideration if we believed it It is true that there are persons who have pilloried medical practice as a game, without realizing that they are playing in a game of destiny, and who thus have caused the wise to stammer and the timid to retreat Some believe that accusations are equivalent to facts and confuse suspicion with certainty In addition, however, there are within and without the profession those who are determined to act for the common welfare

As a member of the House of Delegates of the American Medical Association for many years, I have noted improvements that have been effected in medical practice Now, we are something like the Australian who bought a new boomerang He was brought to the point of complete frustration in trying to throw the old one away Few have, by individual acts, done more harm to the cause of medicine than those who have said, "I don't make house calls," or "I don't make night calls," and have hung up the telephone Fortunately, that behavior is largely of the past Yet I wonder if your county medical society is in a position to challenge those who complain—as did the Alameda County Medical Society, by means of a full page announcement in an Oakland paper—to identify anyone who cannot get medical care at any time What the Alameda County Medical Society strove for and attained is not a nebulous goal but a tangible one, desirable and essential

The formation of mediation committees, established for the public welfare and honestly dedicated to protection of the rights of the individual in his relations with his physician as well as the rights of the physician, is a step in advance For such committees to serve ideally, we of the medical profession must abandon forever a heretofore cherished but erroneous idea that we must, under all circumstances, protect our professional col-

league whether he is right or wrong. There are hundreds of communities without mediation committees and thousands of patients who do not know that such committees exist. Correction of these deficiencies is essential. Yet, even after prodigious effort, progress may seem illusory. You remember when Alice, after running to the limit of her endurance with the Red Queen, found that they still were in the same place by the same tree. Alice remarked that in her country they would have expected to get somewhere by all that running. "A slow sort of country," said the Queen. "Now here, you see it takes all the running you can do to keep in the same place. If you want to get somewhere else you must run twice as fast."

We shall have to do that in our dealings with the society of which we are a part. Accordingly, at this point, may we not consider one additional aspect of those dealings, the aspect commonly designated by the term "public relations?" Only the simplest arithmetic is required to estimate the effect on public relations if more than 150,000 physicians were so deeply imbued with the idealistic principles that underlie the practice of medicine that they invariably, persistently, and intuitively applied those principles in care of the sick. Even more is necessary—coordinated programs of public education concerning our glorious past and also the changing present and the bright future of medicine. These cannot but result in improved rapport with the public, from whom we draw our inspiration and our strength. Some of you detest the word "politics" but to be politic is only to be sagacious in promoting a policy. Good public relations depend on something more sincere than noise, the making of which stopped the river steamer of Lincoln's story. It seems that the whistle was big and the boiler was little, when the captain pulled the whistle cord the paddle wheels stopped turning.

MEDICAL EDUCATION

In the field of medical education we have delegated to professional educators almost all of the responsibility of arranging the curriculums. Educators are as honest and sincere as the rest of us, but they are not practicing physicians. Perhaps this is why premedical curriculums entirely and medical curriculums almost entirely have too little reference to the needs of medical practice as felt by practicing physicians. If this seems a harsh judgment of the premedical curriculum, others, who may be better qualified than I, have been even harsher. They have not confined their strictures to the premedical course. I am thinking of the report of a committee of educators composed of members of the faculties of preparatory schools and colleges, who concluded that the first two years of college are "a serious waste of time."

I have heard, too often to permit me to disregard the statements as hearsay, that in premedical curriculums are courses used as "eliminators." These courses screen out from among students who would seek admission to the medical school most of those who do not have extraordinary intellectual gifts as these are expressed in mastery of difficult fields of pure science that may have small relevancy to the work of a physician or to the qualities of mind and heart of which he should be possessed. We

would be on much firmer ground, I am sure, were we to determine the qualities of heart and mind that characterize successful practitioners of medicine and to evaluate the qualities of prospective medical students on this basis. Studies leading to this goal have already been carried out. Utilization of them remains with the future.

I am told, also, that the scholar, trained to read accurately, to think consecutively and with infinite care, to record only that which before has not been recorded or sufficiently interpreted, will find little in a medical atmosphere that he can recognize as scholarship. He will applaud the amazing technical proficiency with which the physician's vocational training endows him but, if he reads in the medical library, he will deplore the plethora of redundant material, the incoherence, the faulty sentence structure, the inexact quotation, and the wretched arithmetic. The fault lies, I believe, not greatly with the physician himself. He cannot know that with which he has never been made acquainted. The fault can be identified, I believe, as one of the blind spots in the eyes of those who direct education, including premedical education—the failure thoroughly to ground young students in grammar, rhetoric, and composition, the essentials to competence in written or spoken exposition. There grows from this deficiency an unhappy situation. A major part of the contact a physician can effect with his patients, his public, and his professional colleagues is by means of what he writes and says, yet he was not taught, when he was preparing for the study of medicine, to write, speak, or refrain from writing or speaking.

As for medical education itself, since I graduated in medicine I have never been queried by my alma mater about it. Have you? On the other hand, I don't know that I have volunteered my unsolicited opinions to my alma mater. Have you? This is but an example of our lethargy. By silence, we sanction what we cannot wholly approve. Who could know better the essentials of medical education than those who are the recipients of it and who apply what they learned in daily practice? I have talked to many physicians in practice and to many fellows of the Mayo Foundation. They believe, with minor exceptions, that there is much in medical education that is useless, impractical, and anachronistic. The defense usually made by professional educators is that some subjects have for their purpose mental discipline. To this I object. Mental discipline should have been imposed in preparatory school and in the premedical years. What further of this remains to be done in the professional school can be effected better by study of subjects that are useful, practical, and timely.

Just as seems to have been the view of the electorate last Nov. 4, so in medical education I believe we need a change. In the more than a quarter of a century since I graduated from medical school, however, aside from modifications to maintain contemporaneousness, almost the only change has been to bring the student and the patient into contact earlier in the medical course. It seems strange that, although the life blood of medicine is experimentation, in the field of medical education experimentation is sadly unapparent.

Finally, I do not know the answers to my own criticisms of medical education. There are answers.

FINANCIAL COMPENSATION FOR THE INVESTIGATOR

"Iccius, art thou looking now with envious eye at the rich treasures of the Arabians?" Thus Horace deplored his scholar friend's turning from his books to adventure. Possibly, however, Iccius had no choice. Certainly, too often modern medicine binds its servants in science with the fetters of economic slavery, thus adhering to an anachronistic practice. Regardless of whether we like it, success in medicine as in industry is measured in a large part by the ability of the practitioner to earn a good living. The best men seek the best pay. Adequate financial reward is not denied any large part of the great body of practitioners of medicine, those who interpret science for the benefit of the patient, for most of them are independent workers, not on salary. Those engaged in research are, however, treated as public servants are treated. For little reward, they are expected to give much. Too often, the research worker, if he or his wife lacks independent income, must accept a low standard of living and buy his groceries on prestige. It is to the credit of many such workers that they have not been dismayed nor their energies sapped. I believe that advancement in industry would have been greatly retarded had financial rewards for investigators in that field been as inadequate as they are in medicine. Not all investigators will remain in academic bondage and yet continue to give of their best. The "pure delight" of science is not enough.

STATE BOARDS OF MEDICAL LICENSURE

Most of you are aware of the difficulties encountered when a physician desires to move from one state to another. It is clear, I believe, that in most instances the questions raised by the examining board do not pertain entirely to the competence of the physician who desires to establish practice in another state or to his moral and ethical character. He may have competence and moral and ethical standards of the highest order, yet be refused licensure. In some states the candidate is examined relative to his fitness for general practice, although he is a specialist of acknowledged accomplishment and never intends to conduct a general practice. In other instances there is a difficult examination in basic sciences that bears only a tenuous relationship to the past or future performance of the candidate. In such instances the candidate must stuff his mind full of knowledge useless to him except for the temporary purpose of passing the examination, or he must fail. I believe it is true that almost any head of a department in an excellent medical school of any state could not pass examinations to practice in other states without a great deal of cramming. Even after the cramming he might fail. Under modern conditions, when class A medical schools graduate a fairly uniform product, this does not make sense. It seems that the state boards might work out some requirement for licensure that would put less emphasis on a few hours of examination and more on a candidate's formal education and training, his knowledge of the basic sciences, and his record as an adequate and ethical practitioner of good moral character.

There is a fairly widespread impression that some licensing boards erect barriers against competent physicians to exclude competition. If this is true of the board

of medical licensure of any state, and that it is true in some cases seems likely, that board is not meeting the obligations the people of the state placed on it when they granted to it legal authority to give or withhold licensure from physicians who would practice among them. Is there any justification, in a free society, for depriving the public of the opportunity to choose among competent physicians? If this is being done, it would be well for those responsible to examine their own motives.

COST OF MEDICAL CARE

Nowadays there is much talk about the cost of medical care. It has been responsible, according to the newspapers, for larceny and, according to rumor, for impoverishment. It is commonly considered to be a major cause of inadequate medical care. If there are among us those who refuse to furnish medical care because of a patient's inability to pay, they should receive the attention of the intraprofessional mediation committees I mentioned earlier. The responsibility for medical care is, however, reciprocal, the patient should strive to pay his physician. Those who would change medical practice to conform to socialistic ideas, and incidentally, would destroy individual initiative, attempt to persuade him that it is the responsibility of government to care for him when he is ill, and tell him that medical services can be furnished "free." These propagandists prey on the patient's fear in the guise of contributing to public welfare. They bemoan the millions of consumer dollars expended annually for medical care but neglect to indicate that the annual consumer expenditure for medical care is only 4% of the total annual consumer expenditure. They characterize the Taft-Hartley bill as a slave labor law yet fail to note that socialization of medicine means "slave labor" for the physician. Few slaves are able to maintain the quality of their work. The planners emphasize that 1,200,000 families in the United States owe doctors more than \$200 per family and that 200,000 families owe doctors more than \$1,000 per family. Yet the planners disregard the observation that so many families can be so deeply indebted to physicians only because physicians continue to furnish services to persons who have not sustained their credit.

It is not enough that physicians take care of many who are indigent, without fee, a procedure almost unknown in other fields of human endeavor, or that they scale their fees downward better to fit the purses of those who are ill. It is not enough to point out that, in contrast, merchants demand pay for goods purchased without regard to the pocketbook of him who buys. It is not enough to indicate that great discoveries in medicine are the property of all the world without patent and without profit, in most instances, to the discoverer. It is not enough to indicate that the cost of medical care has failed to keep abreast of the increased cost of groceries. It is not enough to urge the people to save for illness as they save for a radio, a refrigerator, or a new automobile. It is not enough to repeat that medicine spells the words "kindness," "loyalty," "devotion," and "consecration" not with its lips but with its heart.

It is enough to furnish excellent medical care for a reasonable fee and to provide prepayment insurance plans to lessen the financial burden of illness. It is dis-

ingenuous to expect physicians to assume the added responsibility of forcing society in general to provide through saving or insurance for the costs of illness. This is not a matter of force but of education of the public, and in this program physicians must continue to play a leading part. It is unfair to ask physicians to shoulder the costs of medical care of the indigent, yet, for the most part physicians have done this without complaint. This, it seems to me, is a matter for welfare agencies, such as the Community Chest, which should provide prepayment insurance for those who cannot buy it themselves.

It is not my intention to discuss in detail prepayment plans, such as Blue Cross and Blue Shield, although in preparation for this presentation I studied them in considerable detail. In general, the better plans have the virtues of protecting each family of low income against most of the costs of professional and hospital care. They do this at a daily cost about equivalent to the price of a gallon of gasoline or a package of cigarettes and a small beer. These plans, conceived in wisdom and supported with enthusiasm in most medical circles, have many virtues, yet they are not without flaws. Speaking once more in generalities, for there is much variation in the provisions of the policies, I find them deficient in the following respects: they do not provide for the cost of care in the home or the office, they do not compensate the insured adequately for hospital charges, and they do not provide for medical care in the hospital. As an internist, I have often wondered whether these plans were sponsored largely by surgeons. Finally, the limitation of benefits excludes provision for the cost of prolonged and disabling illness.

The matter to which I have just referred has been cared for by a "major medical expense policy" issued by one of the large commercial insurance companies. The policy reimburses the insured for hospital costs up to \$15 daily and three-fourths of all other medical costs up to \$5,000. The premium rates seem reasonable. The fact that in 14 months only 8,000 of these policies have been sold may constitute some kind of answer to those who allege that there is a demand for insurance against catastrophic illness.

In my opinion there can be no valid objection, except those I have mentioned, to voluntary, prepayment insurance plans. Except for the indigent, such plans, when improved, will defray most of the costs of illness. Of course, an essential of all medical care is that fees be reasonable. Here again, a few who sacrifice moral and ethical considerations for material gain prejudice the minds of the public against physicians and strike at the reputations of the many within our profession. As I review the bitter attack on medicine by those who would fit it into a socialistic scheme, I cannot escape the conclusion that they aim at more than adequate medical care for society. Nonetheless, they emphasize our errors.

INDIFFERENCE, LETHARGY, AND ENNUI

On several occasions I have mentioned the distressing inaction of which many of us are guilty. It is always deterrent, it may be catastrophic. I wish now to give two examples.

The special assessment of the American Medical Association was greeted with criticism by many, yet I can

honestly observe today that without it we might well be far along the road to administration of medical services by the federal government. Many have accused the American Medical Association of being a political body, yet activity in the field of politics is essential to social progress. Earlier I said that to be politic is only to be sagacious in promoting a policy. Some of you jeer at the American Medical Association and are intolerant of its policies. But could any critic possibly conceive of any aims of the American Medical Association that are not in the general direction of maintenance and improvement of the social welfare of physicians and their patients? Surely none could believe that policies of the American Medical Association have any contrary purpose. It is unbecoming to anyone to benefit from the activities of others of his kind and yet to refrain from contributing to their efforts. You may be acquainted with the habits of the cowbird, which lays its eggs in the nests of smaller species of birds. The hatched interloper grows rapidly, demands the major part of the attention of the foster mother, and eventually pushes its smaller mates out of the nest. When grown, it takes its place in cowbird society. Should we continue to have cowbirds in the medical profession?

It seems clear that most of us do not desire participation of the federal government in medical education. Yet the American Medical Education Foundation has had surprisingly little financial support from most of us. The financial problems of medical schools would be largely solved if each of us would contribute somewhat more than \$100 annually. If we refrain from contributing we shall fail to acknowledge our individual debts to our medical schools, and we shall fail to support a worthy principle.

A PLEA FOR STATESMANSHIP

In closing, I wish to make a plea for statesmanship in medicine, and I can do no better than to quote Walter Lippmann:

The politician stirs up a following, the statesman leads it.

The chief element in the art of statesmanship, under modern conditions, is the ability to elucidate the confused and clamorous interests which converge upon the seat of government. It is an ability to penetrate from the naïve self interest of each group to its permanent and real interest. It is a difficult art which requires great courage, deep sympathy, and a vast amount of information.

Once a man becomes established in the public mind as a person who deals habitually and successfully with real things, he acquires an eminence of a wholly different quality from that of even the most celebrated caterer to the public favor. His hold on the people is enduring because he promises nothing which he cannot achieve, he proposes nothing which turns out to be a fake.

Often, therefore, the great statesman is bound to act boldly in advance of his constituents. This capacity to act upon the hidden realities of a situation in spite of appearances is the essence of statesmanship. It consists in giving the people not what they want, but what they will learn to want. It requires the courage which is possible only in a mind which is detached from the agitations of the moment. It requires the insight which comes only from an objective and discerning knowledge of the facts, and a high and imperturbable disinterestedness.

Statesmanship is a quality of the current medical leadership. It must be supported and improved.

GUIDES TO OPTIMAL THERAPY IN BACTERIAL MENINGITIS

Hattie E Alexander, M D , New York

As a result of extraordinary progress in the development of antibacterial agents, it has been possible for several years to obtain a cure in almost all of the cases of the most frequently occurring varieties of pyogenic meningitis. Sufficient data are now at hand from experience in this field to provide a measure of the actual accomplishments. Clearly the mortality has been greatly reduced, few children die now of meningitis. On the other hand, among the survivors there is an increase in the incidence of persistent cerebral injury of a degree that disturbs function. Such residuals, when they occur, are apparently the result of late diagnosis, both clinical and bacteriological, and of inadequate treatment with the available therapeutic agents.

LIMITATIONS OF THERAPY

The limitations of antibacterial therapy in the past several years are now documented. A number of authors have reported a significant incidence of neurological and psychological sequelae.¹ The frequency of subdural collections of fluid as a complication during recovery from pyogenic meningitis has been reported from a number of institutions. The high incidence of this complication was first reported by McKay and associates²; they pointed out that in the majority of patients the character of the fluid (with very high protein concentration and xanthochromia) and the histological features of the membrane enclosing the fluid are indistinguishable from those in subdural hematomas clearly associated with trauma as well as those of the idiopathic variety. This lesion was interpreted as of great significance in the future mental development of the child because of the constricting action of the membrane. On this premise McKay and associates recommend the drilling of burr holes when an abnormal quantity of fluid is found and removal of a membrane if it is seen.

A high frequency of subdural fluid collections as a complication of meningitis has also been reported from New Orleans by Smith and Prather.³ They explored the subdural space routinely in all patients with meningitis who had open suture lines, subdural collections of fluid were encountered in about 50% of patients in whom exploration was done. A conservative therapeutic policy has been pursued by the New Orleans group. The subdural fluid was removed at intervals, if it ceased to reaccumulate within three to four weeks, nothing more

was done. When the fluid continued to form, burr holes were made and the membrane removed, this was necessary in only 2 of 20 patients. At the Babies Hospital a similarly conservative policy has been pursued with comparable results. Whether the conservative or the aggressive policy is the right one must be determined by a long term follow-up in a large series of patients and will require at least another five year period of study, however, the weight of evidence appears to justify the conservative approach.

Since it is not known whether the presence of subdural collections alters the prognosis for future mental development, the efficiency of any therapeutic program decided on must be judged by the frequency of this complication as well as by other criteria to be discussed. For this purpose routine exploration of the subdural space in patients with open suture lines is essential. Data now available fail to show a significant difference in the incidence of this complication in patients treated with streptomycin and sulfadiazine and in those treated with chloramphenicol and sulfadiazine.

It is apparent that the potential 100% recovery rate in pyogenic meningitis is far from being realized and that this goal can be approached only if optimal therapy is applied. This paper presents guides that are of value in determining the optimal therapeutic regimen. In the process two controversial subjects are discussed: indications for intrathecal therapy and the use of certain combinations of antibiotics. Four principles can serve as guides to optimal therapy.

EARLY APPLICATION OF TREATMENT

The first principle is that, for therapy to be optimal, it must be applied early in the course of the disease. Optimal therapy requires recognition of clinical signs of early meningitis. In patients over 6 to 7 months of age, the signs of early meningeal irritation are easily detectable if they are looked for before any treatment is applied. They may be masked by therapy, however, even by therapeutic measures that ultimately prove to be inadequate. In infants less than 6 months of age, the recognition of signs of early meningeal irritation is much more difficult, abnormal findings must lead to examination of the spinal fluid. When the fontanelle is open and is examined before the baby becomes dehydrated, increased intracranial pressure can be detected as the earliest sign. If this index cannot be used, other less definitive signs can arouse suspicion of early meningitis and lead to examination of spinal fluid, these signs are alternating drowsiness and irritability, a high-pitched cry, a vacant stare, and even unexplained fever. By the use of these signs early diagnosis of meningitis can also be made in this age group, under these circumstances, the prognosis is just as good as in the older age group.

Rapid bacteriological diagnosis is essential for optimal therapy. In the majority of patients, especially in those who are the victims of severe infections and therefore have the greatest need for early optimal treatment, it is

possible to define the etiological agent and assess the severity of infection within 30 minutes after the spinal fluid reaches the laboratory. In a minority in whom immediate diagnosis is not possible, the infectious agent can usually be grown and identified within 12 to 18 hours. Most hospitals are not equipped to make such a rapid diagnosis. If the 100% recovery rate is to be approached, this service must be made available in the future by all hospitals.

RAPID ELIMINATION OF INFECTING ORGANISM

The second principle in optimal therapy is that the infecting organism must be eliminated in the shortest possible time. The multiple antibacterial agents that have been found to be effective against the most frequent varieties of meningitis are listed in table 1. In making the choice in individual cases, a number of guides are useful in selection of a therapeutic program that will result in the most rapid elimination of the infectious agent.

Prevention of Resistance—Two agents should be used that work through different mechanisms of action to prevent emergence of resistance. Each species of bacteria studied has been shown to possess a protective mechanism against any clinically effective antibacterial agent. Provided the bacterial population is large enough, any strain sensitive to an antibacterial agent always contains a minute proportion of cells that resist concentrations lethal for the bulk of the population. Resistant bacterial cells arise spontaneously by mutation; they are therefore selected out for survival when the rest of the population is eliminated by the antibacterial agent. The resistant cells multiply, apparently uninfluenced by the antibacterial agent used, sometimes even thriving on it, they breed true, and thus make up most or all of the population.

Two patterns of emergence of resistance have been described; they are now known as the penicillin pattern and the streptomycin pattern.⁴ The pattern of resistance brought out in bacteria by these two antibiotics accounts for the higher degree and greater frequency and speed of emergence of resistance to streptomycin. The difference in the two patterns may be summarized as follows. A single mutational step that results in a cell resistant to penicillin invariably produces one that exhibits only a slightly higher degree of resistance, a truly high degree can occur only by the accumulation of a number of mutational steps. In contrast, a single mutational step leading to a cell resistant to streptomycin may produce a cell with either a low or high degree of resistance, for example, resistance to more than 1,000 µg per milliliter. From these facts it is apparent that an antibiotic that brings out the streptomycin resistance pattern can never be given in high enough dosage to prevent emergence of resistance. On the other hand, large enough doses of penicillin from the beginning can prevent the first step mutants from surviving if the infecting organisms have not been exposed to penicillin earlier. It is apparent that the pattern of resistance brought out by an antibiotic is one of its most important traits.

Spontaneously occurring mutants resistant to one agent may be normally sensitive to another, indicating different mechanisms of action of the antibiotics. In

table 2 the available knowledge on this subject is summarized. It has been shown that for the gram-positive coccid infections and *Neisseria meningitidis* penicillin must act through a mechanism that differs from that of the sulfonamides. It also differs from that of the newer antibiotics, aureomycin, chloramphenicol and oxytetracycline (Terramycin), since the mutants resistant to penicillin are sensitive to these newer antibiotics. Penicillin plus any one of the latter group can prevent emergence of resistance of strains showing initial normal sensitivity to both agents. Against the gram-negative bacillus group, streptomycin apparently differs in its mechanisms of action from the agents listed below in

TABLE 1—Multiple Agents Effective* Against Organisms That Are Common Causes of Pyogenic Meningitis

Organisms	Rabbit serum	Sulfonamide	Penicillin	Streptomycin	Aureomycin	Chloramphenicol	Oxytetracycline	Polymyxin	Bactracin
<i>H. influenzae</i>	+	+	0	+	+	+	+	+	0
<i>N. meningitidis</i>	+	+	+	+	+	+	+	—	—

table 2, since mutants resistant to streptomycin are normally sensitive to sulfadiazine, aureomycin, chloramphenicol, and oxytetracycline. Demonstration that chloramphenicol in conjunction with sulfadiazine has a therapeutic efficacy equal to the combined action of streptomycin and sulfadiazine for treatment of *Hemophilus influenzae* meningitis represents an important advance. As shown in table 2, chloramphenicol apparently works through a mechanism that differs from that of sulfonamides, streptomycin, and polymyxin. Therefore the broad bacterial action of chloramphenicol, the fact that good concentrations can be attained in spinal fluid after oral or parenteral administration and the fact that, if resistance should emerge, it would be of the peni-

4 Demerec M. Patterns of Bacterial Resistance to Penicillin, Aureomycin and Streptomycin. *J. Clin. Investigation* 28: 891, 1949

cillin pattern rather than the streptomycin type make it an important agent in the treatment of meningitis

The suggestion in some reports that chloramphenicol causes aplastic anemia has not been proved. Evidence of a cause and effect relationship is lacking. I have not been able to demonstrate injury when chloramphenicol is given for 10 days in large doses (orally, 200 mg per kilogram of body weight daily, or intramuscularly, 100 mg per kilogram daily). The mortality statistics in 16 states in which aplastic anemia is listed as a cause of death showed an incidence of deaths from idiopathic aplastic anemia during the period preceding the use of chloramphenicol as high as that which has been recorded in the 8 to 9 million persons who have been treated with this antibiotic. Moreover, evidence on the state of the hematopoietic system prior to chloramphenicol therapy

TABLE 3—Optimal Therapeutic Regimen in Most of the Common Forms of Pyogenic Meningitis

Causative Organism	Therapeutic Agents	Dose	Route	Duration of Therapy, Days	No. of Intrathecal Injections
A Meningitidis	SD	Enough for blood level of 10-15 mg per 100 cc	Subcutaneous & oral	1	
	P*	1 million units twice daily	I M	4	
H Influenzae	CM	100 mg per kilogram or 200 mg per kilogram daily	I M	7	
	SD	Same as above	Oral	7	
D pneumoniae	P†	12 million units daily	I V	3	1 (10-25 mg)
	P*	1 million units twice daily	I M	4	
Str pyogenes	SD	As above		7	
	CM	As above given 3 hr after penicillin		7	
M pyogenes (Staphylococcus)		Same agents and doses as for D pneumoniae		10	4

† Aqueous penicillin

is lacking in most persons in whom aplastic anemia developed in relation to administration of this antibiotic. The circumstantial evidence of a possible relationship between aplastic anemia and chloramphenicol calls for clear indications for the use of this antibiotic, but its great assets merit respect.

Use of Bactericidal Agent—In aiming for the most rapid elimination of the infectious agent, one of the agents used should, if possible, be primarily bactericidal when adequate concentrations are maintained long

enough. Penicillin is in this class for gram-positive cocci and Neisseria organisms, and streptomycin for the gram-negative bacilli. The sulfonamides are primarily bacteriostatic, but they play an important role as adjuncts. The newer antibiotics are generally bacteriostatic, but against *H. influenzae* they have been shown to have a rapidity of action that I would classify as bactericidal.

Bactericidal Concentrations—In order to obtain the most rapid elimination of the infectious agent, bactericidal concentrations must be attained rapidly in the spinal fluid. The bactericidal concentrations must be maintained constantly over a long enough period to kill the organisms during their first exposure.

ANTIBIOTIC ANTAGONISM

Recommendations for use of more than one agent raise the controversial question of antibiotic antagonism. There is no evidence that the interesting laboratory phenomenon reported by Gunnison and associates⁵ limits the therapeutic efficacy of the antibiotics in human infections to a significant degree. The phenomenon that these authors label "antagonism" consists in the slowing of the bactericidal action of low concentrations of penicillin in the presence of low concentrations of the newer antibiotics. It is important to emphasize that Jawetz and co-workers⁶ report that experimental evidence for antagonism cannot be demonstrated under the following circumstances: (1) when the organisms are exposed to even low concentrations of penicillin at least one hour prior to low concentrations of the second agent and (2) when the two agents are used according to a dosage schedule comparable to those in general use for treatment of human infections. When penicillin was used along with chloramphenicol for hemolytic *Streptococcus* infections in mice according to a schedule that maintained adequate levels for three days, Ahern and co-workers⁷ could not confirm antagonism *in vivo*, thus failing to confirm the earlier report of Jawetz and collaborators.⁸ To prevent any hypothetical slowing of the action of penicillin by a second agent as an adjunct, it is recommended that penicillin be administered two hours before the second agent. Otherwise there are no indications that this interesting laboratory phenomenon should influence selection of antibiotics.

Jawetz⁹ has warned against the combined use of a bactericidal antibiotic with an agent that is bacteriostatic on the premise that the bactericidal action will be delayed. The therapeutic superiority of the combined action of penicillin and sulfonamides over the action of penicillin alone in pneumococcus meningitis and the greater efficacy of the combined action of streptomycin and sulfadiazine as compared with that of streptomycin alone for treatment of *H. influenzae* meningitis demonstrate that this premise is not justified.

REDUCTION OF INTRATHECAL THERAPY

The third principle of optimal therapy is that intrathecal therapy should be reduced to a minimum. The aim to reduce intrathecal therapy to a minimum is occasioned not by evidence that complications are caused by reasonable doses intrathecally but by the fact that it is now unnecessary except under the circumstances outlined in table 3.

Dowling and his associates¹⁰ have demonstrated that the enormous doses of penicillin listed in table 3 given intramuscularly or intravenously will result in concentrations in the spinal fluid that are bactericidal against pneumococci and streptococci. There is a lag period of 8 to 12 hours, however, before optimal concentrations are reached in the spinal fluid. Therefore a single intrathecal injection of the dose indicated in table 3 is considered essential for optimal therapy. Staphylococcal meningitis, because of the frequency of resistant strains, the higher concentrations of penicillin, and longer periods needed for killing, requires more than a single dose in intrathecal therapy, one injection daily for four days is recommended.

Adequate sulfadiazine concentrations in the spinal fluid are attained when a blood level of 10 to 15 mg per 100 cc is maintained. This is best accomplished during the first 24 hours by using the subcutaneous route. The dose on a weight basis varies with age. Infants are given 0.1 gm per kilogram at 12 hour intervals for two doses, and older children and adults about one-half this dosage. The fluid intake must be great enough to ensure good urinary output when these doses are given.

Streptomycin concentrations in the spinal fluid after intramuscular administration of 40 mg per kilogram daily fall considerably below those known to be optimal for rapid elimination of gram-negative or tubercle bacilli. If the main reliance is being placed on streptomycin, intrathecal administration is recommended. The development of chloramphenicol, however, reduces the need for streptomycin in pyogenic meningitis, it is still clearly needed in tuberculous meningitis, and in this disease intrathecal administration of streptomycin appears to be essential. Among the newer antibiotics, only with chloramphenicol can optimal concentrations be maintained in the spinal fluid by oral, intramuscular, or intravenous administration.

USE OF SAFE AGENTS

The fourth principle is that agents that may injure patients are to be avoided if others that are safe are equally good. As seen in table 3, it is now possible to avoid, to a large degree, agents that may injure the patient, such as streptomycin, polymyxin B, and bacitracin. Only in tuberculous meningitis is there justification for accepting the risk of damage by the usual streptomycin therapy. In *Pseudomonas* meningitis, polymyxin B is so superior to other agents that the potential hazards are accepted. Recent experience suggests however, that when polymyxin B is used in a dosage of 4 doses of 2.5 mg per kilogram per day given intramuscularly for two days, and with one intrathecal dose of 2 to 5 mg, significant toxicity can be avoided. The knowledge that chloramphenicol can be effective against staphylococci resistant to penicillin usually makes it unnecessary to accept the risks of damage by bacitracin. Two new antibiotics, erythromycin and magnamycin, are also effective against staphylococci that are resistant to penicillin, both appear to be safe.

The duration of treatment will necessarily be conditioned by the stage of infection, treatment is discontinued only when all signs indicate that the infection has been eliminated. The most important of the signs are disap-

pearance of the infecting organisms and normal concentrations of sugar and protein in the spinal fluid.

Tuberculous meningitis is not included in table 3, but the advances in this field warrant an outline of the present status. Although streptomycin in conjunction with *p*-aminosalicylic acid and Promizole (2-amino-5-sulfamylthiazole) represents an outstanding contribution to the treatment of tuberculous meningitis, it is now known that it falls far short of optimal therapy, the survival rate seldom exceeds 50% and persistent cerebral injury of a degree that disturbs function occurs in a significant proportion of the survivors. In addition long periods of intramuscular streptomycin therapy and use of the intrathecal route cause damage to vestibular function in virtually all patients and reduction of hearing in a significant percentage.

It is of interest that emergence of resistance to streptomycin is seldom the cause of failure of therapy in tuberculous meningitis when *p*-aminosalicylic acid either alone or along with Promizole is used in conjunction with streptomycin. The growth of sensitive tubercle bacilli for many weeks after the start of treatment or after a period of negative cultures with recrudescence of the meningitis suggests that the organisms have been protected from the action of streptomycin, which otherwise would select out the spontaneously occurring resistant mutants. There is reason to believe that fibrin protects the organisms from streptomycin.

OTHER REQUIREMENTS

Optimal therapy for tuberculous meningitis must meet three additional requirements. 1 Treatment must be given earlier in the course of infection. 2 A fibrin-removing agent must be found. For this purpose, streptokinase and purified protein derivative of tuberculin are being studied. 3 A second powerful therapeutic agent that will make it possible to reduce the period of streptomycin treatment and thus decrease streptomycin toxicity must be found. Isoniazid, which is being studied for this purpose, may meet this requirement.

The present therapeutic program for treatment of tuberculous meningitis combines the action of streptomycin intramuscularly and intrathecally and *p*-aminosalicylic acid and isoniazid orally. Purified protein derivative of tuberculin is used intrathecally¹¹ in alternate cases. The program aims to use the shortest period of streptomycin therapy both intramuscularly and intrathecally. The intrathecal administration of streptomycin has been discontinued after one week, intramuscular streptomycin therapy is continued along with oral *p*-aminosalicylic acid and isoniazid therapy until the spinal fluid is normal. Although it is too soon to evaluate this program, the early results are very encouraging.

SUMMARY

The potential 100% recovery rate from the most frequently occurring varieties of pyogenic meningitis is far from being realized. Optimal therapy is essential in order to reach this goal. The following principles have

TATTOOING OF NEVUS FLAMMEUS FOR PERMANENT CAMOUFLAGE

Herbert Conway, M D , New York

The obliteration of nevus flammeus (port-wine stain) presents a problem for which neither surgical excision nor the various methods of nonsurgical treatment have provided a satisfactory solution The psychological importance of nevus flammeus to the person who bears this birthmark is frequently so great as to have adverse effects on his personality and social adjustment It is, therefore, especially unfortunate that the methods of treatment in general use fail to bring about the necessary cosmetic obliteration of this congenital deformity

The nonsurgical procedures that have been employed include electrodesiccation, cauterization, distance application of ultraviolet light, and use of carbon dioxide snow, liquid air, ignipuncture, electrolysis, ultraviolet therapy with a Kromayer lamp, x-ray therapy, or radium therapy All these methods must be applied to the lesion through the overlying skin, with consequent injury to or destruction of the skin and subcutaneous tissue Thus, the nevus flammeus is replaced by scarring, which in some cases is even more noticeable and objectionable than the original lesion

Advance in plastic surgery aroused hope that excision, followed by skin grafting, might provide a satisfactory mode of treatment When the area covered by the defect is small, esthetically satisfying results may be obtained with regional flaps or with small free grafts of skin taken from the postauricular or the supraclavicular regions, since these match the color of the surrounding skin In cases in which the nevus flammeus involves an extensive area, however, excision and skin grafting has not been satisfactory Large free grafts must be taken from a protected surface of the body, where the skin differs greatly from that of the face in both color and texture

These considerations led to the search for some means by which the objectionable color of the birthmark could

be camouflaged permanently, without destruction of the overlying skin Since nevus flammeus does not undergo malignant degeneration or increase in size with the passage of time, any procedure that provides a lasting neutralization of the color, without ill effects, meets the criterion for successful treatment

There are three types of nevus flammeus (a) subepidermal, in which the abnormal capillary dilatations that impart the characteristic red or purple color to the birthmark lie under the epidermis in the subpapillary zone of the skin, (b) dermal, in which the abnormal capillaries are chiefly in the midcutis, and (c) subdermal, in which they are in the subcutaneous tissue, subadjacent to the dermis (Andrews¹) (fig 1) When the abnormal capillaries are subdermal or in the deeper portion of the dermis, tattooing, or the injection of insoluble pigments into the dermis overlying the nevus flammeus, has been found to provide a satisfactory method of treatment This method was first reported by Brown, Cannon, and McDowell in 1946² With nevus flammeus of the subepidermal type, the treatment is not effective, since the pigment must be deposited in the dermis if it is to remain permanently Experience has shown, however, that a high percentage of these nevi fall into the classification in which tattooing achieves the desired result.

HISTORICAL BACKGROUND *

The practice of tattooing is of great antiquity and widespread geographical distribution Anthropological evidence indicates that it existed in prehistoric times Among early civilizations, it has been traced as far back as 2000 B C in Egypt and 1100 B C in China It's use has usually been motivated by desire for personal adornment or relationship to religious rites or magical practices It has also been used for purposes of identification

The therapeutic application of tattooing for remedying defects in coloration is said to have been tried as early as the second century A D by Galen, the great Greek physician and medical writer Tattooing of the cornea in cases of leukoma is attributed to him, but little is known of this early work The first definite record of therapeutic tattooing is Pauli's report in 1835 of its use in the treatment of nevi, "congenital purple plaques," and other lesions of the skin In 1848, Cordier advocated tattooing for nevi In 1858, Schuh conceived the idea of using skin

previously tattooed and then transplanted to the site of repair in the technique of cheiloplasty. In 1879, de Wecker employed India ink successfully in coloring the corneal parenchyma. Tattooing of the cornea was again reported by Chevallereau and Polack³ in 1906. In 1911, Kollé described a method of tattooing with rose pigment to change the contour of the vermilion border of the lip. He also recommended tattooing of nonadherent, flat, white scars to improve their appearance. Dufourmentel, in 1919, stated that tattooing appeared to be useful in dealing with wounds, scars, burns, and perhaps also nevi. He credits Mauclairé with having successfully employed the method of Schuh in the treatment of a case of cancer of the lip. Gold and platinum were used to tattoo scars of the cornea by Knapp in 1925 and by Dugan and Nanavati in 1936.

In 1938, a therapeutic use of a somewhat different order was reported by Hollander,⁴ who employed tattooing not for a cosmetic result but to relieve the symptoms of pruritus ani. He states that the idea was suggested to him by the observation that cutaneous syphilis did not involve portions of the skin that had been tattooed with mercuric sulfide (cinnabar). In each of 15 patients with primary pruritus ani whom Hollander treated by tattooing with mercuric sulfide the itching was relieved and the texture of the skin returned to normal. He also used the method successfully in pruritus vulvae and pruritus scroti.

Hance and co-workers,⁵ in 1944, reported the use of tattooing over a period of eight years as an adjunct to plastic surgery to achieve a better effect in the coloration of skin grafts and flaps and to simulate the missing vermilion of lips. No complications resulting from the tattooing were observed. Byars (1945)⁶ also called attention to the procedure as a safe and satisfactory method of obtaining better cosmetic results in plastic surgery. His observations included those of a series of 60 cases of free skin grafts or flaps of tissue on the face. In 1947 Matthews⁷ stated that he had found tattooing a valuable adjunct to the plastic repair of facial wounds and burns. In dealing with scar tissue, he considered the method much less effective. Several reports have been published by Pickrell and his co-workers on the use of corneal tattooing for the restoration of the color of the eye in selected ocular conditions. In their most recent communication, they state that the method has been used "more than 75 times during the past six years, without complications" and with gratifying results.

In 1946, a case was reported by Brown, Cannon, and McDowell² in which permanent injection of pigment white (zinc oxide) was used to neutralize the color of a nevus flammeus, with good results. The following year, Conway and Docktor⁸ described their experience with treatment of nevus flammeus by tattooing in seven cases. The outcome was successful in all these cases, and there were no complications. I reported additional evidence of the value of tattooing in nevus flammeus of the dermal or subdermal type.⁹

TECHNIQUE

Full attention to asepsis is essential in procedures involving the injection of pigment into the dermis, to avoid the possibility of transmission of disease. In discussing

tattooing for ornamental purposes, Madden,¹⁰ states that "local or systemic disease can be injected into the skin at the time of the operation. The manifestations of the injected disease may appear at once or later, the time depending on the particular characteristics of the disease." Smith¹¹ investigated the occurrence of hepatitis in recently tattooed service personnel and found evidence that the viable virus of serum hepatitis could be transmitted from one person to another by means of this process but that this could be prevented by the use of correct techniques.

In therapeutic tattooing at the plastic surgery clinic of the New York Hospital, the area to be treated is washed with soap and water, painted with an aqueous solution of benzalkonium chloride, and draped with sterile towels. Instruments and pigments are sterilized by autoclave. The surgical scrub technique is observed, and a sterilized gown and gloves are worn. The cutaneous area should be free from infection. Surgical drapes are applied.

Fig 1—Histopathological sketch of the relation of the subdermal variety of nevus flammeus to the overlying dermis.

At first the standard electromagnetic device, with six needles, was employed. As the desirability of certain improvements became evident, a modified instrument[†] was developed (fig 2). This instrument is powered through

a motor-driven flexible shaft and has the advantage of feeding the pigment paste slowly. The rate of flow is regulated by a screw. The oscillation rate of the needles is controlled during the operation by a foot pedal. As a rule, the slowest speed at which the needles will function effectively gives the best results. Set at the rate of 3,000

to 3,500 revolutions per minute, the instrument functions effectively. The instrument is quiet when in operation, and the depth to which the needles penetrate is regulated easily. The pigments, mixed into a thick paste with sterile water, are placed (by brush) onto the skin and into the open end of the barrel of the instrument. The needles are inserted into the skin at an angle of about 60 degrees so that their excursion will deposit the particles of pigment in an oblique plane at varying depths in the dermis (fig 3). The depth to which the needles penetrate is

Fig 3—Histopathological sketch of the nevus flammeus after tattooing.

controlled by a set screw. Bleeding and exudation of serum during therapy are managed by sponging between the repeated applications of the instrument to the cutaneous surface. There need be no hesitancy in tattooing directly into the eyebrow or temporal hair line. In lesions extending to the margins of the eyelid, drops of tetracaine (Pontacaine) are put on the conjunctiva, and the lid is stabilized with an eyelid spatula (fig 4).

The following pigments are employed

White	Titanium dioxide
Yellow	Yellow ferric oxide
Red	Mercuric sulfide (cinnabar)
Flesh color	Ferric oxide
Blue	Cobalt (element)
Black	Black iron oxide (or carbon)
Green	Chromium oxide (chrome green)

In addition, ocher, sienna, and other earthy metallic oxides may be used. These pigments are insoluble and may be sterilized in an autoclave. For the covering of nevus flammeus, the basic pigment is white, occasionally mixed with a small amount of red, sometimes in combination with green, ocher, or sienna. The coloration of the patient's skin as well as the shade and intensity of color of the defect are taken into consideration in blending the pigments.

The first treatment is applied over a small area only, a record being kept of the combination of colors. A sterile petrolatum dressing is applied after the treatment. The patient is seen at the end of 24 hours, at which time a

Fig 4—The technique of dermal injection of the cutaneous surface of the eyelid. The conjunctiva is anesthetized with tetracaine and the skin of the eyelid with procaine. An assistant holds the eyelid spatula in place. The technician produces downward traction on the malar skin as the instrument is applied to the area of the eyelashes.

crust is present over the area into which the pigment has been injected. This peels away in 6 to 10 days, after which the effect of the injection may be observed. Definite judgment should be postponed, however, until three or four weeks after the first treatment, because of the fact that, although most of the pigment is inserted in the dermis, some particles are deposited in the region of the capillary dilatations below the skin and some are left in the epidermis. Particles that enter the capillary dilatations of the nevus are carried off in the blood stream. Loss of those deposited in the epidermis occurs through desquamation, which requires several weeks to occur. Hence, the final effect of the injection cannot be evaluated until these processes are completed.

Once the combination of pigments best suited to the patient has been determined, treatments are given at intervals of four weeks until the entire lesion has been tattooed. An area of from 4 to 6 sq. in. may be treated in a period of one hour by a skilled technician. The pro-

cedure is attended by only slight discomfort, which the average adult patient tolerates without anesthesia. The comfort of the patient may be promoted by the mixing of the powdered pigments with solution of procaine (Novocaine) hydrochloride. There is no objection to the direct injection of procaine into the skin and subcutaneous tissues of the area under treatment if the degree of sensitivity of the patient to pain is such that this step is indicated. Children usually require local anesthesia. Treatment is delayed until the age of eight years if possible, as general anesthesia (ether) is necessary in younger children. In patients in whom general anesthesia has been necessary, the interval between treatments has been increased to three months, to prevent development of complications of anesthesia or undue aversion to the induction of anesthesia in the child. Because of the fact that lesions involving the upper lip usually show vascular engorgement, it may be necessary to repeat the dermal injections in that area one or more times. The technique of injection of the margin of the eyelid is shown in figure 4. Ideal results are obtained only when the technician shows patience and persistence.

SELECTION OF PATIENTS

Close inspection of the lesion gives the practiced eye a fairly accurate impression of its depth, i.e., whether it is subpapillary, dermal, or subdermal. In general, the lighter stains respond better than those of deep coloration. Biopsy shows that lesions in which the skin appears to be greatly engorged with blood are those in which the vascular dilatations are resident in the superficial part of the dermis. In such cases, pigment injection is not highly effective. Fortunately, only 15% of the patients encountered in my experience have been of this type. The remainder have sufficient normal dermis overlying the lesion to allow for the successful deposition of particles of pigment. In earlier experiences, it was my practice to rely on biopsy in the selection of patients for treatment. More recently, therapeutic trial treatment in questionable cases has been found to be a reliable guide to the probable result of complete treatment. In lesions of the malar area with extension to the upper lip it is observed regularly that the affected side of the lip is thicker and at a lower level than the unaffected side. This is due to the collection of blood in the lowermost part of the lesion with resultant greater dilatation of vascular channels. Extension of the lesion into the vermillion of the lip has not been effectively camouflaged by pigment injection. Fortunately, in women, this disfigurement is not often of importance, owing to the widespread use of cosmetics. Not many cutaneous lesions other than nevus flammeus have been treated by this method. It is felt that melanoma should not be treated this way, and vitiligo and post-traumatic scars do not respond to permanent pigment injection. For the color matching of skin grafts on the face pigment injection is satisfactory. Nevus flammeus in which the overlying skin has been scarred by previous radium therapy does not respond to pigment injection.

RESULTS OF TREATMENT

In a period of seven years, 310 patients with nevus flammeus have applied for treatment. Forty-seven (15%) of these were rejected because of evidence from biopsy

or trial treatment that the lesion was subepidermal and that treatment, therefore, would not be effective. Two hundred and sixty-three patients have been treated with the goal of satisfactory camouflage of the birthmark. Eighty-four patients were males and 179 were females. The youngest patient treated was 4 years old. Of the 263 patients, 192 have completed treatment. In 159 (83%) of these the camouflage is satisfactory in my opinion, and the patients have expressed satisfaction with the results. Usually women resort to the use of ordinary facial make-up after completion of treatment, but men have not felt the desire or need to use cosmetics. Forty-one patients are still receiving treatment, and no conclusions as to the success of therapy in these have been reached. Thirty patients have discontinued treatment for reasons related to such things as problems of travel and occupations. Thirty-three (17% of the 192 in whom treatment was completed) expressed dissatisfaction or disappointment with the results of pigment injection.

The 192 patients who completed treatment received a total of 1,344 treatments, an average of 7 treatments per patient. The smallest lesions were camouflaged in only two treatments, the first being adapted to coverage of the lesion and the second to accurate color match. Lesions covering about one-half the surface area of the face often required 12 to 20 treatments. Seven patients in whom port-wine stains covered large areas of both sides of the face required more than 20 treatments. In one case, 27 treatments were required.

COMPLICATIONS

Only twice in the course of 1,344 treatments was infection encountered as a complication. In one patient the area of cellulitis was diffuse and the patient had a temperature of 104 F. Recovery was rapid following the use of hot dressings and antibiotics. The end-result was not affected by the complication. In another, pustular dermatitis developed but responded quickly to local therapy. A mildly glazed appearance of the skin was an end-result of therapy in 20 cases. Thickening of the skin was noted in 16. These developments did not cause significant complaining by the patients. In 21 patients, one or several areas of small, elevated, cavernous hemangiomas developed during the course of therapy, presumably owing to trauma from the needles. This was managed successfully in all by excision of these small areas. There were no ocular complications.

SUMMARY

Results of treatment of 263 patients with nevus flammeus (port-wine stain) by tattooing are reported. Permanent camouflage by intradermal injection of insoluble, color-matched pigments was found to be successful only in patients in whom the lesion was subdermal or in the deeper portions of the dermis. Subpapillary nevus flammeus did not respond to the treatment. Forty-seven (15% of all patients applying for treatment) were rejected for this reason. Of 192 patients who completed treatment, the lesions of 159 (83%) were satisfactorily camouflaged. The technique of treatment is described, and complications are discussed.

MILIARIA

Walter B Shelley, M D , Ph D , Philadelphia

The physiological significance of the millions of sweat glands spread over the body surface is well known and appreciated, although there has been a general failure to recognize the significance of these tiny glands in the pathogenesis of skin disease. Studies in the last 10 years have indicated clearly that the sweat gland is either primarily or secondarily responsible for a wide variety of common dermatological disturbances. All of the disturbances result from a simple mechanical obstruction at the sweat duct opening, although the formation of sweat proceeds unimpeded, the free egress of this sweat onto the skin surface is prevented. In consequence, sweat is trapped and retained within the skin, leading to a remarkably varied clinical patterning. For many years,

Fig. 1—Schematic representation of cross section of skin showing normal sweat gland

these clinical facets of sweat retention went unrecognized or were misdiagnosed. It is now possible to define more precisely and simply the clinical features and the pathogenesis of cutaneous disease caused by obstruction in the terminal sweat duct. At the same time, it is possible to eliminate numerous dermatological terms that have now been proved to be synonyms (fig 1).

The term *miliaria* is the generic designation for all skin changes arising as a result of sweat retention¹ and

is the best term to use in describing these changes. It is possible, however, on the basis of simple definitive clinical findings, to subdivide *miliaria* into four groups. Thus the term *miliaria* is analogous to the term *acne*, which is also a generic term encompassing various types of cutaneous changes due to sebum retention. Actually, in many instances, examples of all four types of *miliaria* may be seen in a single patient. This is especially true in patients with secondary *miliaria*. The significant classes of *miliaria* are (1) *miliaria crystallina*, superficial retention of sweat in stratum corneum, (2) *miliaria rubra*, retention of sweat within the epidermis, (3) *miliaria pustulosa*, retention of sweat in the epidermis with secondary leukocytic response, and (4) *miliaria profunda*, retention of sweat within the dermis.

Miliaria Crystallina—Clinically, *miliaria crystallina* is rarely seen in office practice. It causes the patient little or no concern, and, because of its superficial nature,² it is actually of short duration. In its primary form, it is seen most commonly in febrile hospital patients at bed rest. As a secondary *miliaria*, it is seen commonly in various dermatoses, such as sunburn, contact dermatitis, and pemphigus. It appears as a noninflammatory, asymptomatic eruption consisting of numerous small discrete vesicles (fig 2A). These are usually translucent and filled with colorless sweat. At times, however, they appear as white vesicles because of a thicker covering of stratum corneum. The fluid from either a translucent or a white vesicle is clear and colorless. The vesicles are so superficial that the slightest mechanical abrasion, by clothing or a towel, ruptures them.

Miliaria Rubra—Most commonly designated as prickly heat, *miliaria rubra* manifests itself as a pruritic, inflammatory papulovesicular dermatitis.³ It is perhaps the commonest of all skin diseases found in warm environments. It occurs either as a primary disorder or as a secondary complication of numerous skin diseases. The lesions are erythematous papules that are not located about hair follicles (fig 3A). A cardinal diagnostic sign of *miliaria rubra* is the rapid appearance and disappearance of the eruptions in conjunction with the elevations and reductions in body or environmental temperature. Many of the papules develop tiny vesicles or pustules at their apices. The typical sensation experienced by the patient is tingling, burning, or pricking. This sensation is aggravated by sweating and disappears completely when sweating stops. A point of particular note is that the affected areas show either hyperhidrosis or a normal sweat response. Usually over 90% of the glands function normally. The clinical features result from the occluded glands, which comprise only a small percentage of the total number of sweat glands. It is only in the very severe, recurrent *miliaria rubra* and *profunda* that anhidrosis is seen clinically. In these instances, the percentage of occluded glands is greatly increased.

The sites of predilection for *miliaria rubra* are the antecubital and popliteal fossae, the chest, the abdomen, and all areas of friction. It is never seen on the palms or soles, although it may occur anywhere else. It is usually

bilateral and symmetrical. It never occurs in any area in which the sweat gland is absent or not functioning. At times, this is pointed out dramatically in patients who have had a sympathectomy. No miliaria will be seen in the areas affected by the sympathectomy, but it may be prominent elsewhere on the body. Prickly heat may affect nearly everyone if the climatic conditions are sufficiently severe. It is very common in infants who are overclothed. The course of miliaria rubra varies. Initially, a minimum latent period of from two to three days of profuse sweating is necessary, although a person may spend months in the tropics before the disease appears. Miliaria rubra persists and increases in severity on continuous exposure to heat.

Miliaria Pustulosa—Miliaria pustulosa or pustular miliaria is a special type of miliaria seen as a secondary complication in numerous skin diseases.⁴ It also develops secondary to the blocking of the sweat duct or pore. The clinical manifestation is numerous pustules not associated

of the glands are affected, gross anhidrosis is clinically evident. In the absence of sweating, the skin changes are minute and may be unobserved. There are no skin symptoms, but marked heat intolerance because of generalized anhidrosis may be seen in persons with miliaria profunda.

Fig 3—Miliaria rubra. A arrow points to primary lesion, a papule on erythematous base. B diagram shows keratinous plug extending into sweat duct and retention of sweat within epidermis.

COMMENT

From the histological standpoint, all four of these skin diseases have a basic common denominator, namely the blocking of the free flow of sweat to the surface of the

Fig 2—Miliaria crystallina. A arrow points to typical translucent vesicle. B diagram shows changes in skin and sweat gland with keratinous plug in orifice and retention of sweat in stratum corneum.

with hair follicles (fig 4A). Pruritus is severe and associated with sweating. The purulent material is white and is usually sterile. At times, however, the purulent material may become yellow, especially if a secondary invasion by *Staphylococcus aureus* occurs. The pustules are always limited to the areas or sites of the previous or concurrent skin disease. Again the percentage of glands affected is small, so no anhidrosis is clinically evident.

Miliaria Profunda—Miliaria profunda is the term designating the cutaneous changes that occur in patients suffering from tropical anhidrotic asthenia.⁵ The affected skin is studded with numerous noninflammatory papules that show a sweat pore arrangement (fig 5A). None of the papules is found at the site of hair follicles. As in all miliarias, the cardinal diagnostic sign is the increase in size of the papules whenever vigorous sweating occurs. Although clinically the lesions are papules, actually they are collections of fluid in the dermis, and accordingly, at times, it is possible to release free fluid from the papule simply by breaking it with a needle. Generally, since most

Fig 4—Miliaria pustulosa. A arrow points to typical white pustule not associated with hair follicle. B diagram shows sweat retention in epidermis and leukocytic response.

skin by an obstruction of the sweat duct or pore. In miliaria crystallina, the obstruction is extremely super-

4 Lobitz, W. C. Jr. Pustular Miliaria: Sweat Retention Phenomenon Complicating Common Dermatoses. *J. A. M. A.* 148:1097 (March 29) 1952.

5 Shelley, W. B., Horvath, P. N., and Pillsbury, D. M. Anhidrosis: An Etiologic Interpretation. *Medicine* 29:195, 1950.

ficial and the trapped sweat remains within the outer dead skin layer (fig 2B). In miliaria rubra, the sweat is trapped within the epidermis (fig 3B). Miliaria pustulosa presents the same picture except that numerous leukocytes are seen in the epidermal lesion, and a pustule results (fig 4B). In miliaria profunda or the deep type of miliaria, the obstructive changes in the sweat duct extend down through the epidermis resulting in sweat retention in the dermis proper (fig 5B). In all, the prime feature is sweat retention, sweat is secreted into the skin instead of onto the skin.

From the etiological standpoint, it is now possible to unify these miliarias on the basis of a common pathogenesis. In the primary types of miliaria, prolonged maceration of the skin surface with sweat serves as a minor, nonspecific epidermal injury that produces abnormal keratinization and resultant occlusion of the sweat duct orifice. This is the usual antecedent history in miliaria crystallina and miliaria rubra. In miliaria

Fig 5—Miliaria profunda. A, arrow points to typical flesh-colored papule. Entire area is studded with papules except elliptical portion from which a biopsy was taken. B, diagram shows deep keratinous plug and sweat retention in dermis.

pustulosa, the changes are usually produced by a preceding dermatitis. It is interesting that miliaria profunda commonly arises as a disturbance secondary to prolonged, recurrent miliaria rubra. Miliaria rubra and miliaria pustulosa are both accompanied by pruritus that probably arises as a result of stimulation of free nerve endings by sweat seeping into the epidermis. Neither miliaria crystallina nor miliaria profunda show any skin symptoms.

Experimentally it has been possible to induce all four types of miliaria by various injuries to the sweat duct orifice.⁶ From a differential diagnostic standpoint, miliaria probably is not recognized oftener than it is misdiagnosed. Secondary miliaria is extremely common in

the presence of various dermatitides in patients in warm environments. Failure to recognize the presence of secondary miliaria leads to several pitfalls. In many instances, it may be felt that the primary dermatosis is becoming worse, and, therefore, a more intensive program of topical medication is undertaken. This causes unnecessary alarm to the patient and to the physician, it adds to the danger of inducing a sensitivity reaction. At other times, miliaria pustulosa is misdiagnosed as a secondary bacterial folliculitis, and consequently useless antibiotic therapy is employed. Finally, the most important consequence of the failure to recognize the presence of miliaria is that the patient is not advised of the importance of sweat reduction.

THERAPY

This, fortunately, is a group of diseases in which the cause can be removed. Elimination of sweating will bring a prompt improvement in all of these miliarias. This reduction in sweating must be achieved by physiological measures. In other words, the stimulus to sweating must be removed by reduction of the internal heat load or the environmental heat load. Drugs should not be used. In many patients in whom primary or secondary miliaria is a prominent, chronic problem during the long summer months, the use of an air-conditioner is of great benefit. In this regard, it is important to emphasize the fact that residence for eight hours a day in a room kept at moderate temperatures is sufficient to eliminate the major portion of miliaria. In lieu of air-conditioning, measures should be instituted to improve ventilation and to reduce the atmospheric humidity. The use of fans is also of benefit, since they increase heat-loss by evaporation and reduce maceration. Particular note should be made of the fact that, in the case of troops in the tropics, those persons with a high susceptibility to miliaria should be transferred to a temperate zone. The patient not only should be advised of the dangers of prolonged macerative effects of sweating but should also be warned of the danger of using any agents on the skin that are even mildly injurious to the epidermis. This includes too frequent bathing, excessive use of soap or detergents, and use of irritating topical medicaments and clothing or accessories that cause friction.

Although this is a group of diseases in which the cause is known and for which measures can be taken to produce a cure, economic and practical considerations are often such that persons are forced to work under atmospheric conditions that produce and accentuate miliaria. As a result, patients and physicians alike turn to topical medicaments as a means of relieving the condition. These preparations actually offer little more than a token of psychotherapy, yet tons of lotions, powders, and ointments are expended yearly in the fight against miliaria. It is doubtful that any beneficial effect is achieved by this mass attack on a self-limited although extremely annoying dermatitis. I inveigh against the use of such preparations, since they are double-edged swords. Any irritative effects they have on the skin are rapidly transformed into more plugging and obstruction of the sweat gland orifices.

SUMMARY

As a result of recent clinical and laboratory research, it is possible to integrate our knowledge concerning the obstructive disorders of the sweat gland. Miliaria is the generic term for cutaneous changes occurring when sweat is trapped in the duct of the sweat gland by an obstruction of the terminal end of the duct. The four types of miliaria that are seen depend on the depth at which sweat is trapped within the skin. These four types are miliaria crystallina, miliaria rubra, miliaria pustulosa, and miliaria profunda.

Diagnosis of the miliarial group rests on the correct recognition of vesicles, pustules, or papules, with or without erythema, which appear dramatically whenever sweating is induced. The development of secondary miliaria of all types commonly occurs in areas of dermatitis in patients in warm environments and, as such, is a prime factor in the flare-ups and chronic nature of skin disease during the summer. Treatment is specific and effective. It includes all measures that reduce the need for sweating. Topical and systemic therapy are without specific value.

SUCCESSFUL RESECTION OF ANEURYSM OF THORACIC AORTA AND REPLACEMENT BY GRAFT

Michael E. De Bakey, M.D.

and

Denton A. Cooley, M.D. Houston, Texas

Various procedures have been used in the surgical treatment of intrathoracic aortic aneurysms. These have been recently reviewed¹ and classified as follows: (1) those designed to promote thrombosis and fibrotic organization of the process by ligation, introduction of foreign material, or periarterial fibroblastic reaction, (2) endoaneurysmorrhaphy, and (3) extirpation of the lesion with or without restoration of blood flow through the parent vessel. With the exception of the last method, most of these procedures have proved generally unsatisfactory. Obviously the procedure of choice is extirpation of the diseased part and restoration of normal function, but this has been successfully accomplished in only a relatively small number of cases of sacciform aneurysms¹ or those associated with coarctation.² So far as we have been able to determine, there are no reports of its successful application in a case of fusiform aneurysm of the thoracic aorta. It seems desirable, therefore, to report the following case of a syphilitic aneurysm of the descending thoracic aorta that was successfully resected with restoration of normal blood flow by means of an aortic homograft.

REPORT OF A CASE

A 46-year-old white man was admitted to the Methodist Hospital on Dec. 31, 1952, complaining of lower back, left lower abdominal, and inguinal pain of three months duration. The pain began spontaneously, and at the outset occurred in episodes necessitating hospitalization on several occasions. For the previous few weeks and on admission to this hospital, the pain was constant, sharp, and severe and was partially relieved by lying on the left side. For adequate relief, however, opiates or meperidine (Demerol) was required as often as several times daily. Barium studies of the upper gastrointestinal tract and roentgenograms of the thoracolumbar spine made at the Hertzler Clinic in Halstead, Kan., were interpreted as showing an aneurysm of the terminal thoracic and proximal abdominal aorta producing erosion of the vertebral bodies at the level of the diaphragm. The patient gave a history of treated syphilis. A cholecystectomy had been done five years previously.

Physical examination revealed a well-developed, anxious man who appeared chronically ill. The pulse was regular and the blood pressure was 140/80 mm Hg. The heart was not enlarged, and there were no unusual sounds or murmurs. There was a well-healed subcostal incision on the right side of the

abdomen and no organs, masses, or hernias were palpable. Deep palpation in the left lower quadrant of the abdomen and over the left inguinal ligament elicited pain, but there was no paresthesia or hyperesthesia. Likewise palpation over the lumbosacral region was painful, but there was no specific localization. The findings on neurological examination, including tendon reflexes, were normal. Circulation in the lower extremities was good. Although the posterior tibial pulses were not palpable, the dorsalis pedis pulses were strong and the feet were warm.

Laboratory findings revealed an erythrocyte count of 5.17 million, hemoglobin level of 16.9 gm per 100 cc, and white blood cell count of 10,000, with 80% segmented neutrophils, 3% band forms, 14% lymphocytes, and 3% monocytes. The Kahn serologic test for syphilis was doubtful, and the Kolmer test was negative. The urine was dark amber with a specific gravity of 1.033 and an acid reaction. There were 35 mg of protein per 100 cc, a trace of sugar, and some acetone. There was no diacetic acid, and microscopic examination disclosed no abnormal findings. The blood urea nitrogen level was 14 mg per 100 cc, and the prothrombin activity was 100% of normal. An electrocardiogram revealed no abnormality.

Roentgenographic studies of the chest revealed the heart and lungs to be normal, but a large mass was visible behind the heart and arising at about the diaphragm. Lateral projections of the thoracolumbar vertebrae in the region of the mass revealed extensive erosion of the bodies of the 9th, 10th, 11th and 12th thoracic vertebrae and the first lumbar vertebra; they were most marked at the 11th and 12th thoracic levels (fig. 1). The intervertebral bodies were not eroded. Fluoroscopic copy revealed a pulsatile mass measuring about 20 by 15 by 15 cm behind the heart. The mass appeared to be continuous with the lower thoracic aorta and displaced the esophagus and stomach anteriorly and to the left. Results of an excretory urogram were normal.

On Jan. 3, 1953, with the patient under thiopental (Pentothal) anesthesia, aortography was performed by insertion

From the Department of Surgery, Baylor University College of Medicine and the Methodist Hospital.

The work in this case was aided by a grant from the Houston District Chapter of the Texas Heart Association.

of a no 10 French woven catheter into the left brachial artery and threading of the catheter under fluoroscopic control into the midthoracic aorta. Then 30 cc of 70% iodopyracet (Diodrast) solution was injected rapidly, and a single film was exposed. The aorta and the extensive aneurysm were moderately opacified. The aneurysm was demonstrated to have a layer of clot on both sides, represented by a nonopacified rim

Fig 1—Lateral roentgenogram of the lower thoracic vertebrae showing extensive erosion of the vertebral bodies from the ninth thoracic to the first lumbar vertebra

of tissue. The aorta was displaced to the left by the aneurysm, which presented primarily on the right and posteriorly. Multiple intercostal arteries were visualized as well as branches of the celiac axis (splenic and hepatic arteries), both renal arteries, and the superior and inferior mesenteric arteries (fig 2).

Operation—On Jan 5, 1953, anesthesia was induced by ether administered by tracheal intubation, the patient was placed in a 45 degree right lateral position, and the pleural cavity was entered through the bed of a resected segment of the ninth rib (fig 3A). The lung was retracted forward, and the aneurysm was exposed. The lower thoracic aorta arched anteriorly on the proximal margin of the aneurysm, which appeared to be about 20 cm in length and 20 cm in its greatest diameter. It was firmly adherent to the vertebrae posteriorly. The mediastinal pleura was incised over the proximal aorta, and the aorta was encircled with an umbilical tape. In order to expose the distal portion of the aneurysm, the thoracotomy incision was extended obliquely across the upper abdomen, dividing the costal margin. The diaphragm was incised, and the esophageal and aortic hiatuses were opened. The spleen was removed to facilitate exposure. Inferiorly the aorta was encircled just distal to the celiac axis but proximal to the renal and superior mesenteric arteries. At this point the aorta was only adherent to but not involved in the aneurysm itself (fig 3B). Atraumatic arterial clamps were then used to occlude the proximal and distal aorta after injection of 10 mg of heparin solution, and the celiac axis was occluded separately (fig 3C). The aneurysm was dissected off adjacent structures anteriorly and partially excised in order to provide adequate space for the homograft.

An aortic homograft measuring approximately 15 cm in length was simultaneously prepared to bridge the defect. The graft had been originally obtained six days previously from

a 21 year old Negro man who had died of acute injuries. The graft was obtained under sterile conditions two hours after the donor died and was kept for 36 hours in sodium chloride solution containing 1 gm of streptomycin and one million units of penicillin. The graft was transferred to Gross's medium, to which no serum had been added, and stored at 4 C. By a continuous through-and-through suture of 4 0 arterial suture the graft was anastomosed to the proximal and distal ends of the aorta (fig 3C).

The blood pressure, which prior to aortic occlusion was 140/100 mm Hg, rose promptly to 200/100 after the occlusion. The pressure decreased to 160/100 during the 45 minute period that elapsed before the clamps were released after completion of the anastomosis. As the aortic clamps were released very slowly, the blood pressure dropped immediately to 80/60 mm Hg and remained at that level throughout the remainder of the operation although the patient's general condition appeared good. There was minimal bleeding from the lines of anastomosis, and after a few minutes this stopped completely. The remaining portion of the aneurysm and its contents were then removed and layers of thrombus in varying stages of organization were scooped out piecemeal, leaving the intact intervertebral cartilages protruding forward several centimeters above the eroded vertebral bodies. Because the graft was suspended across the area excavated by the aneurysm, a portion of the omentum was displaced into the thorax and sutured around the graft to protect it from the rather sharp intervertebral bodies posteriorly and to provide a vascular soft tissue support. The incision in the diaphragm was repaired with interrupted silk sutures, and the thoraco-abdominal incision was similarly closed, leaving an intercostal catheter for underwater sealed drainage. During the procedure, which lasted 4 hours and 40 minutes, the patient received 1,500 cc of whole blood by transfusion.

In the first 24 hour period after surgery the urinary output per Foley catheter was 900 cc. Renal function remained good throughout the patient's hospitalization. Atelectasis of the right upper lobe was demonstrated by roentgenogram on the second day after operation and this was successfully treated by tracheal aspiration and induced coughing. The postoperative course was otherwise uneventful. The patient became ambulatory on the sixth day after operation, and the sutures

Fig 2—A roentgenogram showing aneurysm of descending thoracic aorta. B diagrammatic representation of the aortic tributaries and the involved structures.

were removed on the seventh day. The previous complaint of severe back and left lower abdominal pain was completely relieved, and the patient required no further analgesics. There were no manifestations of cord damage, and the circulation in his extremities appeared much improved. His appetite and spirits were excellent at the time of discharge from the hospital on Jan 18, 1953, 13 days after operation, and he resumed his duties as county sheriff approximately one month later.

COMMENT

The only other case in which a somewhat similar procedure was employed was recently reported by Lam and Aram.³ Their patient also had a large syphilitic fusiform aneurysm of the descending thoracic aorta, but the procedure employed by them differed from that used by us in that the aneurysmal sac was left in situ and an aortic homograft was used to bypass it. The patient died almost three months later from a mediastinal abscess in the aneurysmal sac and secondary hemorrhage. The likely occurrence of such a complication from ischemic necrosis of the sac consequent to its devascularization was pointed out by Tuffier⁴ many years ago and emphasizes the importance of extirpation of the aneurysm under these circumstances. This was forcefully impressed upon us by our experience with two previous cases in which fatal hemorrhage occurred from the aneurysmal sac that was not extirpated.¹

Another important technical consideration in the performance of this procedure is concerned with the potential ischemic hazards of arrest of circulation in the aorta distal to the point of occlusion immediately above the aneurysm, particularly on the spinal cord and the kidneys. The problem here differs from that in coarctation in which a well-developed collateral circulation already exists. To avoid this danger Lam and Aram³ used a Lucite (polymerized methyl methacrylate) tube over which the homograft was placed to permit blood flow between the two ends of the aorta during the anastomosis. In this way it was hoped to minimize the period of arrest of the circulation, the actual time of occlusion in their case being 24 minutes on one occasion and 15 minutes on another. In spite of this, however, their patient manifested some cord damage, with temporary partial paraplegia. In light of these findings our case is remarkable in that there were no postoperative manifestations of ischemic changes in the cord, the kidneys, or other organs, in spite of the fact that the aorta was occluded for a period of 45 consecutive minutes during which the anastomosis was performed. This would suggest that, at least under some circumstances such as these, the aneurysm may stimulate the development of some collateral circulation or may gradually create in the tissues supplied by this part of the aorta an increased tolerance to a diminished blood supply. The operation of these factors, individually or in combination, may thus be sufficiently effective to maintain viability during the period of occlusion of the aorta required for the anastomosis. Although it is not possible to draw conclusions from a single case, the fact remains that the 45 minute period of occlusion was well tolerated by our patient. This is a matter of considerable importance, however, since the feasibility as well as the facility of the procedure is to a great extent dependent upon it.

In this connection there are several technical features of the procedure that deserve consideration. The first is concerned with minimizing the period of occlusion by leaving the actual extirpation of the aneurysm until after

completion of the anastomosis of the graft and release of the occluding clamps. While it may be necessary to excise a part of the sac in order to provide adequate space for placement of the graft, the major portion of the aneurysm and its contents may be removed after restoration of blood flow through the graft. The second point is concerned with the avoidance of thrombosis in the vascular bed distal to the point of occlusion as a possible consequence of the slowing down of the circulation in these vessels. With this objective in mind, a small amount of heparin was injected into the aorta just prior to the application of the occluding clamp. Finally the method of anastomosis employed in our case consisted of a simple continuous through-and-through suture rather than the mattress suture placed so as to fix the intima in an everted

Fig 3—A position of patient and placement of incision. B, anatomical relationships of the aneurysm to the thoracic and abdominal viscera. D, representation of the aneurysm showing the relative position and size of the sac and eroded vertebral bodies.

position. From our experience with resection and replacement by aortic homografts of abdominal aortic aneurysms, we believe that this method of anastomosis provides equally satisfactory results while at the same time facilitating the performance of the procedure.⁵

5 De Bakey M. and Cooley D. A. Surgical Treatment of Aneurysms of Abdominal Aorta by Resection and Restoration of Continuity with Homograft. *Surg. Gynec. & Obst.* to be published.

It is, of course, too early to determine the ultimate results of this method of surgical treatment of these aneurysms. On the basis, however, of experimental observations on aortic homografts and the clinical results obtained by their use in coarctation,⁶ there is reason to believe it provides a better approach to the problem than was hitherto possible. Its ultimate clinical value, as well as certain technical considerations concerned with its performance and the most desirable material for bridging the defect, must await further observation and experience.

SUMMARY

A case is reported of a 46-year-old white man with a huge, probably syphilitic, aneurysm of the descending thoracic aorta producing extensive erosion of the vertebral bodies and incapacitating symptoms. The aneurysm along with the involved segment of aorta was successfully

resected with restoration of normal blood flow by means of an aortic homograft. Although the aorta was occluded for a period of 45 minutes during the anastomosis, there were no residual manifestations of ischemic changes in the spinal cord, the kidneys, or other organs.

ADDENDUM

According to a recent letter, dated May 2, 1953, from his local physician, the patient has continued to show progressive improvement with complete relief of symptoms. He has gained 40 lb (18.2 kg) since his discharge from the hospital and has returned to work apparently completely recovered.

ROENTGENOGRAPHIC DIAGNOSIS OF CALCIFICATION IN CARCINOMA OF THE BREAST

J Gershon-Cohen, M D, Helen Ingleby, M B

and

M B Hermel, M D, Philadelphia

Abnormal calcification of tissue has attracted study from the earliest days of roentgenology, but, so far, calcifying processes in the breast have received little attention. Not until 1949 did an observation appear dealing with the diagnostic importance of punctate calcification in carcinoma of the breast. The significance of this report by Leborgne¹ has become evident to us after comparative x-ray and histological examination of the breasts of 425 patients.

The use of the whole breast slicer technique of Ingleby² and of routine histological examinations have served to check accurately the roentgenographic findings, which are now based on recently improved techniques.³ We suspect that we may have overlooked many cases of carcinomatous calcification in the films made by older techniques. The present method of examination, patterned after that of Leborgne,¹ takes advantage of fine grain, non-screen films and the small focal spot of the latest model, rotating anode, x-ray tube. Without this equipment, it is impossible to delineate the fine structural details and calcification of malignant processes in the breast.

ROENTGENOGRAPHIC APPEARANCE OF CALCIFICATION

The calcium deposits in malignant breast lesions are punctate, but the margins are angular rather than circular or curvilinear. This gives the deposits a crystalline or

granular appearance. Their number and concentration may vary greatly without apparent relationship to the size of the malignant lesion. They may aggregate as a small cluster in the primary malignant lesion itself, or they may be dispersed partially in the surrounding tissues. Rarely, calcium deposits may permeate the breast widely, and this may occur even in the absence of a primary, isolated malignant focus. This poses the hope that some occult carcinomas⁴ may now be diagnosed before symptoms appear or a biopsy is made.

Leborgne¹ believes that small, circumscribed deposits of these granular calcified particles are likely to occur in scirrhous carcinoma, whereas widespread disseminations occur in occult canalicular or comedocarcinoma. These conclusions seem to be substantially valid as judged by our experience so far. Thus the finding of widespread punctate calcium deposits, even in the absence of a palpable tumor or other signs of neoplasm, would indicate the necessity for surgical intervention. Routine use of the x-ray examination as part of diagnostic breast studies, even if only for locating calcium deposits, would thus seem foresighted.

Familiarity with the appearance of these sand-like calcium deposits in malignant breast lesions makes differentiation from other calcifying processes easy (fig 1 and 2). But another form of calcification that also may occur in malignant lesions, as well as elsewhere in the breast, is seen in small sclerotic arteries. These vessels normally are seen in the subcutaneous fat layer and in the breast proper if there is sufficient infiltration of the fat. Calcification in these small vessels may be recognized by the two parallel rows of calcification corresponding to the vessel walls. A calcified vascular pattern is, therefore, quite different from the irregular clusters of calcified particles in malignant tissue.

Calcification due to phleboliths is not easily confused with that in malignant tumors. Phleboliths usually are few in number and are sparsely scattered along the course of the veins, which are seen readily in x-ray films of the breast. Furthermore, phleboliths are larger and smoother in outline than the punctate deposits of malignant processes. Fibroadenomas of the breast often contain calcified deposits. These are flaky, lamellar, or otherwise bizarre in shape and are always localized to the tumor, either inside or in the peripheral encapsulation. Rarely, calcification in ducts, cysts, or periductal tissue may occur after suppurative infection. These calcified deposits may be localized or disseminated and may vary in size and shape. Unlike the clusters in malignant processes, these deposits adhere to the trabecular architecture of the breast.

COMMENT

Abnormal calcification occurs in tissues in which vitality is reduced or absent, usually as the result of inflammation. Fatty degeneration usually precedes calcification. The roentgenologist, like the pathologist, is familiar with calcification in arteriosclerosis, valvular heart disease, pericarditis, old thrombi, and healed tuberculous lesions. Abnormal calcification may also occur in masses of excretion and secretion, as in tonsillar crypts, in the bronchi, or in ducts of various glands. The universal presence of phosphorus in nuclei, the existence of fatty acids in cells and tissue, and the frequent occurrence of fatty degeneration before calcification, set the stage for the formation of calcium soaps, proteinates, phosphates, and carbonates. Concretions that form in areas of long-standing inflammation are usually lamellar or otherwise deposited in fibrous tissue, while the punctate, psammomatous or sand-like deposits of some breast carcinomas seem related more to the finer structures of the parenchyma. The pathologist is likely to give only passing attention to these secondary changes, but the

Fig 1—A roentgenogram of malignant breast infiltrations with granular calcified deposits. B photomicrograph of calcified particles in the same breast.

arresting over-all pattern caused by these changes has diagnostic possibilities for the roentgenologist.

The peculiarities of these calcified deposits may be related merely to the growth characteristics of some breast cancers. The slow growth of comedocarcinoma and some other canalicular neoplasms may lead to degenerative changes eventually resulting in calcification.

Other slowly growing tumors, such as the pearls of epidermoid carcinoma, atrophic portions of rodent ulcer, and old necrosed portions of glandular carcinoma, also often contain much calcium. In psammocarcinoma of the ovary, kidney, or parotid gland, many dense, calcified deposits derived from epithelial concretions may be

Fig 2—A roentgenogram of diffuse occult duct carcinoma with scattered calcified deposits. B photomicrograph of a calcified focus in necrotic debris in the same breast.

found. But the deposits in these neoplasms differ in size and shape from those seen in the inspissated detritus of the distended ducts of comedocarcinoma and in some other forms of duct carcinoma of the breast. While the calcified deposits in acanthoma are not like those of breast cancer, the slow growth of calcifying acanthoma is similar to that of calcifying malignant breast lesions.

SUMMARY

Granular or psammomatous deposits of calcium sometimes occur in malignant breast lesions. These deposits may be clustered within a single lesion or they may be dispersed into the surrounding structures. Rarely, these deposits may be found diffusely permeating a breast in the absence of a primary focus and are thus the only indication of an otherwise occult malignant infiltration. Thus, routine x-ray examination would appear to be warranted in studies of breast disease.

York and Tabor roads (Dr Gershon Cohen)

Polio myelitis—Large epidemics of paralytic poliomyelitis seem to be a reflection of the improved living and sanitary conditions of the countries which suffer them. In most parts of the world poliomyelitis epidemics are small or unimportant, and paralysis, when it occurs, is almost limited to children under 5 years old. As the virus is liberally distributed, nearly everybody comes in contact with it before that age, and progressively acquires enough resistance to make a paralytic illness unlikely. On the other hand, in a person not protected by previous exposure to the virus, the likelihood of paralysis rises during childhood, being lowest in infancy and reaching a peak in early adult life. As research on the virus has been almost exclusively carried out in countries where the disease is epidemic rather than endemic, we have come to think of epidemics as the natural host virus relationship. But the reverse appears to be actually the case. Instead of coming recently to prey on man, the virus seems rather to have lived in more or less harmonious relationship with us for centuries, and it is we who, by altering our living conditions, have upset the balance.—P. N. Meenan, M.D., *New Concepts of Poliomyelitis*, *The Lancet*, April 18 1953.

EXPERIENCES WITH CARDIOPERICARDIOPEXY IN THE TREATMENT OF CORONARY DISEASE

Samuel A Thompson, M D

and

Aaron Plachta, M D , New York

For more than 13 years we have been treating a selected group of coronary patients with one particular operation.¹ This operation was devised and adopted as a result of animal experiments, in which it gave complete protection to the animals following the ligation of a main coronary artery, the same ligation without the operation resulted in a mortality of 50%. We believe that this operation, known as cardiopexy, has a definite value, and we now present our experience with 57 of these operations. In discussing coronary disease, we are very much aware of the divergence of opinions expressed by various groups studying this problem, and even of the various persons in each group, however, it is generally accepted that angina, coronary insufficiency, and coronary occlusions are all varying degrees of a common condition, namely, myocardial ischemia.

The enormity of the problem of coronary disease is evident in mortality statistics. The number of persons who died in 1950 from cardiovascular diseases was 745,000. Each day's total was 2,040, and every hour's total was 85, this is more than one every minute and more than from any other cause. Cardiovascular diseases account for over 50% of the total death rate in the United States. Coronary artery disease accounts for one-half of these deaths, or 22% of the total death rate. There has been a general increase in coronary deaths of 114% over a period of seven years, and the increase among physicians in this same time was 240% (Life Extension Institute). Coronary disease appears to be an occupational hazard of the medical profession² and is the only major disease in which the mortality each year has increased over the mortality of the previous year for the past 10 years, it is now at an all-time high, 78.2 per 100,000 (Metropolitan Life Insurance Company).

Of the patients who survive their first coronary artery occlusion, about two-fifths make a complete functional recovery.³ Some of the remaining three-fifths, however, suffer from angina, which increases in frequency and severity and causes a progressive restriction in their physical activities. Some of these patients are partially, and others are completely, incapacitated by the anginal pains and are actually coronary cripples. The medical treatment for this specific group of patients is insufficient and very unsatisfactory. It consists principally of symptomatic relief, dietary regimens, and psychotherapy. We are

not speaking now of every coronary patient but refer to that particular group of patients who are incapacitated. Very few, if any, of these patients are ever rehabilitated to the point where they are relieved of their angina or can return to their former occupations.

METHOD

It is with this same group of cripples that we have been working for many years, and we believe that we have a satisfactory method for the surgical rehabilitation of these patients. The operative procedure is known as cardiopercardiopexy, and the method consists of converting the ischemic myocardium of coronary disease into a hyperemic myocardium. This change from hypoxemia to hyperemia of the myocardium overcomes the mechanical effect and clinical symptoms of the disease. It is accomplished by spreading sterile powdered magnesium silicate over the myocardium inside the pericardial sac. This substance is known as U S P talc, however, it is not the ordinary commercial variety of talcum powder but is a form of powdered silica. When the talc is placed inside the pericardial sac, it acts as an irritant and causes three principal reactions: a talc granuloma is produced that involves the superficial surface of the myocardium, it stimulates the development of interarterial coronary anastomoses, and it produces adhesive pericarditis.

After the introduction of the magnesium silicate inside the pericardial sac, an acute inflammatory reaction takes place that involves all of the structures in the mediastinum, including the pleura, pericardium, epicardium and adjacent myocardium, the esophagus, and lungs. One of the characteristics of this acute reaction is the marked hyperemia of the myocardium that occurs within a very few hours. As a result of this reaction and hyperemia, there is a dilatation of the anastomosing blood vessels that are already present between the main coronary arteries and, also, a stimulation in the formation of new intercoronary blood vessels. As the acute reaction subsides, it is followed by a chronic reaction—a foreign body granuloma that develops on the surface of the myocardium, this is characterized by hyperemia and increased vascularity. This chronic inflammatory reaction may last for many years, since the powder particles remain fixed within the adherent tissues of the myocardium and pericardium for an indefinite period of time. Adhesive pericarditis occurs as a result of the inflammation, but constrictive pericarditis does not take place, nor do any other adverse complications occur as a result of the adhesions. The hyperemia of the myocardium is further enhanced by the free communication of new blood vessels between the mediastinal structures and the adherent pericardium and myocardium.

In coronary disease a constant attempt is made by the myocardium to produce new collateral coronary anastomoses.⁴ If the necessary length of time is given, or a suf-

ficient stimulus exists, the rate at which these new collaterals are formed may become equal to the rate of occlusion produced by the disease process. We believe the irritation and hyperemia of the foreign body (talc) reaction is a sufficient stimulus to the myocardium for the development of new interarterial communications. Even though the hyperemia of the acute reaction subsides and some of the immediate stimulus is thereby withdrawn, the increased collateral formation, once it is started, may continue to form and function for an indefinite period of time, even without further stimulation. It would appear from these reactions that the mechanical effects and clinical symptoms of myocardial ischemia can be mitigated by cardiopericardiopexy, regardless of the underlying cause of the myocardial ischemia.

The possibility has occurred to us that the granulation tissue might eventually change into scar tissue and, with the passage of time, become avascular and thus afford no collateral circulation. We do not believe this occurs. We have slides of autopsy specimens from patients who had been operated on and subsequently died from within a few days up to 10 years after the operation. The characteristic features of all of the specimens are the granulomas, which show marked vascularity and the presence of the talc granules. These autopsy specimens definitely prove that the granulomas remain vascular for at least as long as 10 years.

Fig. 1—Early lesion characterized by serous nonsuppurative pericarditis and marked hyperemia ($\times 74$)

Occasionally the lesion that follows the operation has been compared to and described as similar to the lesions seen in constrictive pericarditis. Such a comparison is erroneous and far from the actual facts. In constrictive pericarditis the pericardium may or may not be adherent

but is usually thickened and is avascular. When the pericardium is removed from the myocardium, little or no bleeding occurs, but, after cardiopericardiopexy, the pericardium is always adherent, has never been found to constrict the myocardium in any degree, and is exces-

Fig. 2—Fibrous adhesive granulomatous pericarditis with persistent uniformity and vascularization. A the abrupt line of the pericardium and its union by delicate fibrous connective tissue stroma to the myocardium without encroaching on the latter; B granulomatous pericarditis; and C large blood vessels within the inflamed pericardium ($\times 46$)

sively vascular and hyperemic. When the pericardium is separated from the myocardium, it is done with great difficulty, as no line of cleavage can be found and bleeding occurs from both pericardial and myocardial surfaces. This condition was found to exist not only in the animal experiments but in one patient who was examined four and one-half years after an operation. Also the autopsy studies, up to almost 10 years after cardiopericardiopexy, show the same lesion still existing.

In the histopathological study of the autopsy cases following the introduction of U S P talc, it is evident that a definite uniform acute inflammatory lesion of the parietal and visceral pericardium is produced. This lesion (fig 1) in the early stage is characterized by an acute nonsuppurative serous and serofibrinous pericarditis, actively stimulating marked hyperemia. The lesion consists of a diffuse infiltration of lymphocytes and monocytes, strikingly confined to the surface of the pericardial membranes. This activity with its maximum reaction persists for about three days.

After the third day of inflammatory activity a marked transition takes place with the appearance of eosinophilic leukocytes, plasma cells, and the deposition of fibrin. Gradual development of multinucleated giant cells in a loose fibrous stroma becomes apparent at about 14 days after surgery, with persistence of the talc crystals. This uniform granulomatous lesion abruptly terminates at the surfaces of the pericardium (fig 2). The junctional union consists of a loose fibrous connective tissue stroma permitting free motion of the myocardium. This active pericarditis is associated with an extracardiac inflammatory reaction in the adjacent viscera, such as lungs, mediastinum, and diaphragm, resulting in anastomosis of extracardiac vessels with the intercoronary vessels through the bridge formed by the adherent granulomatous pericardium (fig 3), housing multiple blood vessels, the inter-

nal diameter of which is far above the so-called critical 40μ .⁵ The striking features of the lesion, when fully produced, are the persistence, uniformity, and stability, which do not deviate with a lapse of many years following surgery (fig 4). A report of the pathology in combina-

face of the myocardium. The tissues are then closed in anatomic layers without drainage. It is a simple operation and does not, of itself, carry any great risk.

RESULTS

In order to fully determine the effects of the operation, no patient has been included in this series who has been operated on less than one year previously. The total number of operations was 57. Deaths attributed to the operation and all hospital deaths after the operation numbered seven, giving an operative and hospital mortality of slightly more than 12%. Of the 50 remaining patients who have been followed up to the present time, or the time of their death, 37 were men and 13 were women. This is a ratio of slightly less than three to one. The youngest patient was a woman of 35 (the youngest man was 36), and the oldest patient was also a woman, aged 68 (the oldest man was 64). The average age of the entire group was 51, and the majority of patients (23) were in the sixth decade. Three were in the fourth decade, 19 in the fifth, and 5 in the seventh. Thirty-three of the patients are living at the present time.

The duration of the symptoms before the operation has been recorded from the patients' histories. The shortest duration of symptoms before the operation was three months and the longest was 15 years, giving an average of $3\frac{1}{2}$ years. There is a sharp difference, however, in the

Fig 3.—Persistent uniformity of granulomatous pericarditis in a patient 10 years after cardiopericardioplexy. A, granulomatous pericarditis and B, large vascular channels leaving the pericardium and extending by branches into the interstitia of the myocardium ($\times 68$).

tion with visual dissection and roentgenographic studies will be published in detail in an article to follow.

In the past we have severely limited the indications for operation and accepted only those who had more or less critical forms of coronary disease with a marked degree of disability.⁶ In view of the results that we have obtained, we now believe that with more liberal indications the operation can be successfully applied to a much larger group of patients. Since the rationale of the operation is to produce a myocardial hyperemia, it could be used to counteract the effects of those lesions that produce myocardial ischemia. The majority of lesions producing myocardial ischemia fall into three groups, namely, coronary artery disease, hypertension, and rheumatic disease. Together they are responsible for about three-fourths of all cardiovascular deaths.

Because of a previous description,¹ we will not now describe the operation more than to say that it consists of removing a small piece of the fifth cartilage on the left side of the chest. The pericardial sac is opened, and the magnesium silicate powder is spread widely over the sur-

Fig 4.—Polarized photograph of figure 3 showing persistence of talc crystals within the areas of granulomatous pericarditis in a patient 10 years after cardiopericardioplexy.

duration of symptoms of the patients who are still living and in those who have died. The living patients had had their symptoms for an average of two and three-quarters years, while the patients who have died had symptoms for an average of four and one-half years before operation. In 37 patients angina was the first symptom, and coronary

5 Zoll P M, Wessler S and Schlesinger M J. Interarterial Coronary Anastomoses in the Human Heart with Particular Reference to Anemia and Relative Cardiac Anoxia. *Circulation* 4: 797 (Dec) 1951.

6 Thompson S A. and Raisbeck M J. Surgical Rehabilitation of Coronary Cripple. *Ann Int Med* 31: 1010 (Dec) 1949.

occlusion was the first symptom in 13. Three of the patients had congestive failure, and seven had hypertensive disease.

The shortest length of life after the operation was two months and the longest 13¾ years, with an average of about 5 years, however, 33 of the patients are still living, so this average is subject to an increase from time to time. Of the 17 patients who were followed up to the time of their death, the average duration of symptoms before operation was four and one-half years and the average life span after operation was five years. Thus the span of life of these patients from the first symptom was nine and one-half years. This compares very favorably with the span of life of the average coronary patient who is not operated on. Statistics on these patients vary with each group reported, but averaging all the groups gives a life span of four to five years from the onset of the first symptom.

While our group of patients is small and no definite conclusions should be drawn from a small group, we nevertheless believe that the span of life for these patients has been markedly increased by the operation for two reasons. First, the average length of life after appearance of symptoms for coronary patients not operated on is four to five years, and that for our group of patients is nine and one-half years. Second, the large majority of patients operated on were in a terminal state and were completely incapacitated, having experienced one or more occlusions, and very few of them could be presumed to continue life for any length of time. They had already lived for four and one-half years and were thus at the end of the average life span for coronary patients, yet they continued to live after the operation for an additional average of five years.

Because there are no satisfactory objective tests by which we can measure the postoperative improvement or prognosis, it has been necessary for us to rely on subjective tests. There are four tests that we use to determine the postoperative benefits: first, the decrease in the amount of anginal pain, second, the increase in the exercise tolerance, third, the improved ability to attend to daily needs, and fourth, a return to the former or some other gainful occupation. Using these four tests as a guide, we have divided the patients into three groups. The first group, with less than 50% improvement, we classify as having poor results. The second, with 50 to 75% improvement, we classify as having moderate results. The third group, with more than 75% improvement, we classify as having marked results.

The first patient who had had a cardiopericardiopexy is still alive and in excellent condition almost 14 years later. Of the 50 patients followed, 5, or 10%, have received less than 50% improvement and are classed as poor results. The remaining 45 patients, or 90%, have received more than 50% improvement. Twenty of these patients, or 40%, have received more than 75% improvement as measured by the four tests and are classed as markedly improved. Some of the patients in this last group are subjectively normal and have no angina and no decrease in the exercise tolerance. For a group of patients who were medical failures and almost all of whom

were completely incapacitated, this operation has produced very satisfactory results, which we could not duplicate with other measures.

CONCLUSIONS

In conclusion, it should be emphasized that we have operated on a group of patients almost all of whom were in a terminal state, were medical failures, and were completely incapacitated. They had everything to gain and nothing to lose from the operation, and very few of them were satisfactory surgical risks. In spite of these handicaps, we have been able, by means of this operation, to rehabilitate these patients so that 90% are more than 50% improved and 40% are more than 75% improved. In addition to their physical improvement, the patients who have since died lived an average length of life after the operation of five years, giving them an average life span of nine and one-half years from the onset of the first symptoms. We do not believe these patients would have survived this length of time without the operation.

Anemia of Infection.—The anemia associated with infection is one of the most commonly encountered forms of anemia, if not the most common of all. With the newer means for controlling infections, it may be anticipated that the incidence of the anemia of infection will be greatly reduced. Already the incidence of such diseases as empyema, lung abscess, and chronic osteomyelitis has been lowered significantly.

The factors which determine whether or not anemia will develop in a patient with an infection deserve careful analysis.

No information is available whether the location of the infection (in bones, lungs, liver, subcutaneous tissue, or else where) is of any importance in the development of the anemia. Whether one type of organism, e. g., streptococcus, pneumococcus, aerobacter, is more likely to produce anemia than another is not known. James et al., in a study of patients with various suppurative lesions, presented evidence that in those patients whose infections were due to several different organisms, the greater the number of different genera of organisms, the lower were the hemoglobin levels. It is our impression that the severity of the infection, as indicated by the severity of the accompanying systemic reaction, is probably the most important factor in determining whether or not anemia will develop, provided the infection persists for a sufficiently long period of time. Infections of mild degree are generally not accompanied by anemia. Infections of less than a month's duration as a rule are not accompanied by a significant anemia. Since the normal life span of erythrocytes is approximately 4 months, this would be expected if it is admitted that the anemia is due to decreased production of erythrocytes by the bone marrow.

The anemia of infection occurs commonly in infants and children [but] no age group is spared. It is generally assumed that more severe and prolonged infections are likely to develop in inadequately nourished individuals.

The anemia associated with chronic infection, as indicated by the quantity of hemoglobin per unit volume of blood, is generally mild in degree. A severe anemia is so rare that its presence should make one suspect the presence of another cause for anemia, such as renal disease, iron deficiency, or increased blood destruction.—G. E. Cartwright, M.D., and M. M. Wintrobe, M.D., *The Anemia of Infection*, in "Advances in Internal Medicine," Chicago, The Year Book Publishers, Inc., 1952, vol. 5, p. 165.

HYPERCHOLESTEREMIA

EFFECT ON CHOLESTEROL METABOLISM OF A POLYSORBATE 80 CHOLINE INOSITOL COMPLEX (MONICHOI)

The demonstration by Anitschkow¹ that cholesterol is the biochemical factor responsible for the experimental production of atherosclerosis marked the beginning of modern experimental and clinical investigation into the cause, prevention, and treatment of atherosclerosis. The extent and variety of studies initiated by those original findings almost half a century ago is evidenced by the profuse bibliography appended to any of the recent reviews of the subject. Although the observations noted in this mass of reports are often contradictory and controls adequate to allow for correlation between different studies has been lacking, the general idea is well established that there is an important relationship between the concentration of cholesterol in the blood plasma and the development of atherosclerosis. Recent studies, notably those by Kellner and his associates,² stressed the importance of the physicochemical phenomenon associated with the maintenance of cholesterol and serum lipids in a stable emulsion.

The present paper has a two-fold purpose: (1) to evaluate the significance of elevated serum cholesterol levels in the general medical population of a large hospital and (2) to give a preliminary report on the clinical use of a chemical complex that, through its effect on the serum lipid emulsion, seems to open new channels for the investigation of the physiological role of cholesterol.

SERUM CHOLESTEROL LEVELS IN A HOSPITAL POPULATION

The first portion of this study is concerned with a survey of the serum cholesterol levels in 960 consecutive patients admitted to the medical services of the Fordham Hospital. Blood was drawn for serum cholesterol determinations from all patients within 72 hours after admission, except from those who were near death and diabetic patients who showed evidence of instability in their diabetic status. Patients who were seriously ill were included

in the study on their recovery, and patients with poorly controlled diabetes were included in the study after control was established.

All chemical determinations were performed by the same technician in the Metabolic Research Laboratory of Fordham Hospital. Serum cholesterol levels were determined by a modification of the Bloor method as reported by Abell.³ The values ranged from 44 mg per 100 ml in a patient with extensive tuberculosis to 1,334 mg per 100 ml in a patient with myxedema. When the patients studied were discharged from the hospital, the final diagnosis was added to the laboratory record. Patients having a serum cholesterol level of 300 mg per 100 ml or over were considered hypercholesteremic for the purposes of this study. The following tabulation shows the diagnoses established in the 960 patients studied.

	No	%
Cardiovascular disease	572	59.57
Diabetes	110	11.46
Pneumonia	107	11.15
Arthritis	9	0.94
Carcinoma of the lung	6	0.63
Cholelithiasis with obstruction	8	0.81
Gout	3	0.31
Hypothyroidism	2	0.21
Other	148	15.43
Total	960	100

Note that 59.6% of the patients were discharged from the hospital with a diagnosis of cardiovascular disease. This group plus the patients discharged with a diagnosis of diabetes accounted for 71% of the hospital admissions.

One hundred thirty-one (13.7%) of the 960 patients studied had serum cholesterol levels above 300 mg, ranging from 300 mg to 1,334 mg per 100 ml. The following tabulation shows the incidence of hypercholesteremia in relation to diagnosis.

	Patients with Hypercholesteremia	
	No	%
Cardiovascular disease	91	69.46
Diabetes	27	20.77
Pneumonia	2	1.54
Arthritis	3	2.03
Carcinoma of the lung	1	0.77
Cholelithiasis with obstruction	8	6.03
Gout	1	0.77
Hypothyroidism	2	1.54
Other	1	0.77
Total	131	99.68

Note that almost 70% of the patients with hypercholesteremia are found in the cardiovascular group. Addition of patients with diabetes and associated hypercholesteremia bring this number up to 90% of the total number of patients with hypercholesteremia. The patients in both groups account for 71% of the total number of patients studied. Table 1 shows the sex distribution and

the incidence of hypercholesteremia among 572 patients with cardiovascular disease and 110 diabetic patients. An analysis of the relationship of hypercholesteremia to age and sex is shown in table 2. Study of these statistics indicates that between 30 and 79 years of age (for which age groups the number of patients studied is adequate for statistical evaluation) there is a steady rise in the mean serum cholesterol value, starting at 211.2 mg per 100 ml and increasing through each decade to a mean value of 275.6 mg per 100 ml. Note also that the incidence of hypercholesteremia increases in each decade up to 80 years of age. It is equally significant to note the fact that between 40 and 70 years of age the incidence of hypercholesteremia is greater in women, reaching a definite peak between 50 and 60 years of age. A possible explanation for this sex difference in hypercholesteremia will be discussed later.

BACKGROUND FOR PRESENT STUDY

Kellner's observations on the inhibitory effect of polysorbate 80, a surface active agent, on the deposition of cholesterol in the vessels of cholesterol-fed rabbits² and the report of Krantz and co-workers⁴ on the toxicologic, pharmacodynamic, and clinical observations on oral ingestion of polysorbate 80 prompted a clinical evaluation of polysorbate 80 in patients with hypercholesteremia. Kellner reported a rise in the blood cholesterol level and diminished atheromatous deposition in the rabbit with intravenous use of polysorbate 80. The report of Krantz and his associates showed no evidence of toxicity in the human in amounts of 6 gm a day taken orally over a period of four years. Analysis of the urine and stools of subjects studied by them showed complete elimination of the polyoxyethylene moieties of the emulsifier from the body, about 5% was excreted in the urine and 95% in the stool. The continued administration of polysorbate 80 in over 100 human subjects for periods up to four years failed to show any alteration of the metabolic rate, blood chemistry, or excretion of water-soluble vitamins or evidence of damage to the liver, kidneys, or hematopoietic system. Specifically, their studies on blood cholesterol in normocholesteremic patients failed to show any change in serum cholesterol values during the period of polysorbate 80 intake.

Polysorbate 80 in a 30% aqueous solution was accordingly administered, under our supervision, to a number of patients with hypercholesteremia in amounts of 20 cc daily divided into four doses. No appreciable change was observed in the serum cholesterol levels. At the same time, six other hypercholesteremic patients were given a standard commercial preparation of choline, inositol, and methionine, with no change in the serum cholesterol levels.

As a result of these preliminary observations, an experimental mixture of polysorbate 80, choline, and inositol was prepared, containing 500 mg of polysorbate 80, 500 mg of choline dihydrogen citrate, and 250 mg of inositol in each 5 cc of the solution. From June, 1951, to December, 1951, this mixture was given to six patients at the Fordham Hospital. All were controlled diabetics on a standard diet, and all were hospitalized during the experiment. All patients had pretreatment serum cholesterol levels above 300 mg per 100 ml on at least two

occasions before medication was started. The pretreatment of cholesterol levels ranged from 320 to 521 mg per 100 ml. In each instance, there was a significant drop in the serum cholesterol value while the patient was taking the polysorbate 80-choline-inositol complex. Serum cholesterol values were determined once weekly during this study. A significant drop in the serum cholesterol level was noted within two weeks after the start of therapy. At the end of three weeks' treatment, the greatest fall in the serum cholesterol values had been noted in all patients. This drop ranged from 93 to 216 mg per 100 ml. The greatest reductions in serum cholesterol values were noted in patients with the highest pretreatment levels. The reduction persisted as long as the patients were maintained on the polysorbate 80-choline-inositol complex. When medication was discontinued, there was a prompt rise in the serum cholesterol value, usually approximating the pretreatment values (table 3).

TABLE 1—Sex Distribution and Incidence of Hypercholesteremia Among 572 Cardiovascular Patients and 110 Diabetic Patients

Because of these observations, it was decided to broaden this aspect of the clinical investigation and study the action of the polysorbate 80-choline-inositol complex on serum cholesterol and its related compounds. The high content of cholesterol in the adrenal cortex, the work of Conn and co-workers⁵ demonstrating a significant decrease in circulating serum cholesterol on persistent stimulation of the adrenal cortex, and the report of elevated serum cholesterol associated with Addison's disease⁶ prompted the inclusion of a survey of the urinary steroids and urinary cholesterol in association with the serum cholesterol studies.

METHODS AND MATERIAL

The first step was to establish a set of normal values. One hundred thirty-six serum cholesterol level determinations were done on serum obtained from adults in whom this level was persistently below 300 mg per 100 ml. These specimens were taken from subjects of all ages, all of whom were patients in the hospital on a standard hospital diet. The values ranged from 168 to 286 mg per 100 ml. One hundred thirty-nine determinations of 24 hour urine cholesterol excretion were done on the same subjects, according to the method described by Davidson.⁷ These values ranged from a low of 0.28 mg to a high of 0.45 mg per 24 hours. One hundred eighty determinations of the urinary excretion of formaldehydrogenic steroids were done on the same patients by the method described by Daughaday.⁸ The values ranged from 120 to 162 μ g per 24 hours. Fifty-five determinations of urinary 17-ketosteroid excretion were done on

TABLE 4—Mean Serum Cholesterol and Urine Cholesterol, Formaldehydrogenic Steroid, and 17-Ketosteroid Levels in Untreated Normocholesteremic Patients

	Mean	Standard Deviation	Standard Error	Coefficient Variation, %
Serum cholesterol	222.3 mg /100 ml	80.9	8.7	13.9
Urine cholesterol	0.35 mg /24 hr	0.04	0.01	11.4
Urine formaldehydrogenic steroids	137.3 μ g/24 hr	10.39	2.52	7.6
17 ketosteroids, males	15.5 mg /24 hr	1.43	0.63	9.3
17 ketosteroids, females	9.8 mg /24 hr	0.99	0.46	10.5

TABLE 5—Mean Serum Cholesterol and Urine Cholesterol, Formaldehydrogenic Steroid, and 17-Ketosteroid Levels in Untreated Hypercholesteremic Patients

	Mean	Standard Deviation	Standard Error	Coefficient Variation, %
Serum cholesterol	333.7 mg /100 ml	50.9	6.2	14.9
Urine cholesterol	0.48 mg /24 hr	0.20	0.03	42.2
Urine formaldehydrogenic steroids	127.3 μ g/24 hr	30.10	6.00	23.6
17 ketosteroids, males	15.2 mg /24 hr	1.51	0.50	9.9
17 ketosteroids, females	8.4 mg /24 hr	1.85	0.39	21.9

male patients according to the method of Dreker,⁹ the values in this series ranged from a low of 11.1 mg to a high of 18.6 mg per 24 hours. An equal number of determinations were done on female patients using the same method, and the values varied from 7.8 to 12.2 mg per 24 hours. The mean values in normocholesteremic patients are shown in table 4.

A similar statistical survey was done on patients with hypercholesteremia (serum cholesterol levels above 300 mg per 100 ml). The following laboratory studies were done: 210 serum cholesterol determinations ranging from 300 to 785 mg per 100 ml, 143 determinations of urine cholesterol excretion ranging from 0.21 to 1.8

mg per 24 hours, 81 determinations of urinary formaldehydrogenic steroid excretion ranging from 40 to 196 μ g per 24 hours, 69 urinary 17-ketosteroid determinations were done on male patients with hypercholesteremia, with values ranging from 12 to 18.8 mg per 24 hours, 72 similar determinations were done on female patients with hypercholesteremia, ranging from 3.1 to 14.2 mg per 24 hours. Table 5 shows the mean values.

Serum protein-bound iodine determinations were done periodically, by a modification of the method reported by Harsha,¹⁰ on the hypercholesteremic patients treated with the polysorbate 80-choline-inositol complex to demonstrate normal thyroid function. The normal range is from 3 to 10 μ g per 100 ml. Studies on blood surface tension and the urinary excretion of alcoholic sterols have not as yet been completed and will be reported at a later date.

The subjects chosen for this study were inpatients on the medical services of the Fordham Hospital. The diabetics included in the study were well controlled, and their diet did not vary appreciably while they were under observation. Patients with myxedema, biliary obstruction with icterus, nephrosis, and uncontrolled diabetes were not included in this group. Patients with hypothyroidism and frank myxedema have been evaluated according to the method described but will be reported on separately because of the interesting results obtained.

Before the study of the effects of the polysorbate 80-choline-inositol complex on any given patient was begun, a minimum of two serum cholesterol determinations as well as urine cholesterol and steroid studies were done. Determinations of the serum protein-bound iodine level were done sporadically during the course of any individual study to indicate the constancy of thyroid function during the period of observation.

RESULTS

Sixteen patients with hypercholesteremia (serum cholesterol levels ranging from 306 to 521 mg per 100 ml) were studied in the manner described. After pretreatment cholesterol levels had been determined, all patients were given daily 20 cc of the polysorbate 80-choline-inositol complex divided into four doses. While these patients were being supervised in the hospital, the medication was given with reasonable regularity. Occasionally a dose was missed, because either the nurse was occupied with urgent duties or the patient was absent from the ward for a diagnostic procedure. The patients' diet did not vary during the observation period.

Of the 16 patients studied, only one failed to show evidence of response to the complex by revealing no significant change in the serum cholesterol or urinary steroid levels. This patient had a carcinoma of the lung with metastases. There was no evidence of diminished liver function, although the patient continued to lose weight and had no appetite. Fifteen patients showed a definite response, characterized by a significant fall in the serum cholesterol level, usually evident during the second week of treatment and reaching its lowest level between the fifth and sixth weeks. In no patient treated were hypocholesteremic levels reached. The fall in cholesterol ranged from 59 to 233 mg below the pretreatment levels. Usually, the higher the pretreatment serum cholesterol level was, the greater the fall observed.

during treatment. The fall in serum cholesterol concentration was accompanied by a significant rise in the output of urinary cholesterol, which seemed to reach a peak during the second or third week of treatment and then gradually returned to pretreatment levels. There was also a significant rise in the urinary output of formaldehydogenic steroids (table 6), this rise was more protracted than that noted for urine cholesterol, but as the length of the study period increased, a decrease toward the pretreatment level occurred. No change was noted in the output of urinary 17-ketosteroids as compared with pretreatment levels in any patient. No change in the serum protein-bound iodine level was noted at any time during the study. All the observations on this series of

§ D Treated hypercholesteremic patients

patients are listed in table 7. The chart shows a characteristic pattern of the changes in the serum cholesterol, urinary cholesterol, and urinary formaldehydogenic steroid levels as noted in 1 of the 15 patients who responded to treatment with the polysorbate 80-choline-inositol complex.

Cessation of treatment resulted in a prompt rise of serum cholesterol values to pretreatment levels. In two patients who showed the described changes in serum cholesterol, urinary cholesterol, and urinary formaldehydogenic steroid levels medication was stopped after four weeks, and in both instances all values studied promptly returned to pretreatment levels. After three weeks with no therapy, both were started on treatment with daily doses of 20 cc of a 30% polysorbate 80 solution. The only change noted was an increase in the total 24 hour urine output. No change whatever was noted in

the values for serum cholesterol, urinary cholesterol, or urinary formaldehydogenic steroids. After three weeks polysorbate 80 therapy was discontinued, and, treatment with the polysorbate 80-choline-inositol complex was reinstituted. A prompt fall in the serum cholesterol values was noted in both patients, associated with a corresponding increase in the output of urinary cholesterol and formaldehydogenic steroids. The observations on one of these patients are shown graphically in the chart.

All patients with hypercholesteremia who were treated with polysorbate 80-choline-inositol complex experienced a feeling of well-being that cannot at present be explained physiologically, although it was consistently noted and may possibly be attributable to increased adrenal cortical function as manifested by an increased urinary output of formaldehydogenic steroids. All of these patients noted increased diuresis, especially during the first weeks of treatment (see the chart). Preliminary observations would indicate that this is related to the administration of polysorbate 80.

Typical response of a hypercholesteremic patient (a 67 year-old woman hospitalized for a cardiovascular accident) to treatment with the polysorbate 80-choline inositol complex.

Ten patients with normal serum cholesterol levels, below 300 mg and ranging from 192 to 288 mg per 100 ml, were studied in the same manner. After adequate pretreatment levels were recorded, they were given 20 cc daily of the polysorbate 80-choline-inositol complex for periods up to nine weeks. As in the hypercholesteremic patients, the serum and urinary cholesterol and urinary 17-ketosteroid and formaldehydogenic steroid levels were determined frequently. In no patient was there a change in any of these values beyond the normal variations (table 8).

The data shown in table 6 were obtained by applying statistical techniques to the observations to test their significance. The figures reveal that for each criterion the effects created by the medicament could not be due to chance, because, in each instance, the calculated T is higher than the T at the 99% or 99.5% levels, respectively. In part C of table 6, where the calculated T was lower than the T at the 99.5% level, it was logically expected to be so, as in the case of the comparisons

between treated and untreated normocholesteremic patients, between untreated normocholesteremic and hypercholesteremic patients, and between treated normocholesteremic and untreated hypercholesteremic patients

One patient with Addison's disease was studied. This patient had hypercholesteremia and was given the polysorbate 80-choline-inositol complex prior to treatment with desoxycorticosterone acetate for adrenal inadequacy. No change in the serum cholesterol level was evidenced either with the complex alone or with the complex in combination with desoxycorticosterone acetate. Throughout the observation period the urine cholesterol excretion ranged from 0 to 0.2 mg per 24 hours. The value for 17-ketosteroid excretion was 2.6 mg per 24 hours, and the formaldehydogenic steroid value ranged from 21 to 34 μ g per 24 hours. The serum protein-bound iodine value was 6.8 μ g per 24 hours (table 9).

COMMENT

It would appear from this study that the polysorbate 80-choline-inositol complex has physiochemical properties not manifested by any of its component parts. The use of either polysorbate 80 or choline and inositol preparations individually have, in our experience, failed to produce any of the changes reported in this paper. The combination of these substances resulted in a "complex" that lowered the serum cholesterol levels while increasing the urinary cholesterol and formaldehydogenic steroid output in a limited number of hypercholesteremic patients.

These facts strongly suggest that the mechanism for the lowering of the serum cholesterol level in these patients is related to adrenal cortical function. In addition, the increase in urinary cholesterol output associated with the fall in the serum cholesterol level would suggest a change in the character of the lipid molecule that enhances glomerular filtration. Such an action can be rationalized for this complex by an evaluation of its components. Polysorbate 80 is an effective dispersing agent and, as Kellner has demonstrated, it produces a profound change toward increasing the stability of lipid emulsions. Choline and inositol are also essential in the formation of substances necessary for fat transport. Although the previous reports of the action of the individual components on serum cholesterol have been largely confusing, the therapeutic preparation described seems effective in lowering serum cholesterol in the presence of an intact adrenal cortex. In view of the fact that the preparation produces no apparent change in the serum cholesterol level or urinary excretion of cholesterol and corticosteroids in normocholesteremic persons, it would seem that at least in the hypercholesteremic patients reported the state of serum cholesterol is such as to hinder its utilization by the adrenal cortex. The use of the polysorbate 80-choline-inositol complex seems to alter the state of serum cholesterol to make the cholesterol molecule more easily filterable through the renal glomerulus and more accessible to the adrenal cortex for its requirements.

Verification of these facts requires the study of a much larger series of patients than has been reported. In addition to continuing these studies, the Metabolic Research Laboratory at Fordham Hospital is conducting investiga-

tions into surface tension phenomena in normocholesteremic and hypercholesteremic patients before and after treatment with the polysorbate 80-choline-inositol complex. A more thorough investigation of urinary steroids has been started with chromatographic techniques.

With regard to additional hormonal factors in the regulation of the serum cholesterol level, it is interesting to note that in our survey the incidence of hypercholesteremia was greater in women between the ages of 40 and 70 years, reaching its peak between 50 and 59 years. A possible explanation may be that this greater incidence of hypercholesteremia is related to the gradual diminution in ovarian hormone production, with consequent increase in serum cholesterol. This increment may represent that portion of serum cholesterol previously utilized in the production of ovarian hormones.

SUMMARY

In a survey of the serum cholesterol levels in 960 consecutive patients admitted to the medical services of Fordham Hospital, 13.7% were found to have serum cholesterol values of 300 mg per 100 ml or over, 69.5% of the patients with hypercholesteremia had cardiovascular disease, and 20.7% had diabetes. Analysis of these data revealed that the mean cholesterol value increases with each decade as does the incidence of hypercholesteremia. A sex difference in the incidence of hypercholesteremia between the fifth and seventh decades was noted. During this period, the incidence of hypercholesteremia is greater in women, reaching a peak between 50 and 59 years of age. The possible role of the ovary in this sex difference is mentioned.

The effect of a polysorbate 80-choline-inositol complex on the serum cholesterol and protein-bound iodine levels and urinary cholesterol, 17-ketosteroid, and formaldehydogenic steroid excretion in 16 hypercholesteremic patients is reported. In 15 of the 16 patients studied, there was a significant drop in the serum cholesterol level associated with a rise in the output of urine cholesterol and formaldehydogenic steroids. No change in the 17-ketosteroid excretion was noted. No such changes were noted in a patient with Addison's disease and hypercholesteremia or in normocholesteremic patients. The role of the polysorbate 80-choline-inositol complex in changing the state of the serum cholesterol emulsion and the enhancement of cholesterol utilization by the adrenal cortex are discussed.

CONCLUSIONS

The long-range value of the lowering of elevated serum cholesterol levels could not be discussed in this report. The number of patients studied and the length of the study were too limited, and it was inexpedient in the preliminary report to record occurrence of any changes relative to atherosclerosis. This is the subject for a long term study, which is now under way. The use of the polysorbate 80-choline-inositol complex has, however, given some indication of the role of the adrenal cortex in the control of cholesterol metabolism and the influence of the state of the serum cholesterol emulsion on adrenal cortical function. This will, we hope, on further study, shed some light on the physiological role of cholesterol in man.

LIGATION OF HEPATIC AND SPLENIC ARTERIES IN TREATMENT OF CIRRHOSIS WITH ASCITES

William Francis Rienhoff Jr, M D

and

Alan C Woods Jr, M D, Baltimore

The surgical treatment of disturbances of the blood flow through the liver resulting from intrahepatic disease and caused, in the majority of patients, by one of the various types of cirrhosis of the liver, has been and continues to be unsatisfactory in many patients. There is no question that, at present, medical management in cases of cirrhosis of the liver is the treatment of choice. In spite of commendable adherence by a patient to any particular medical regimen, however, such treatment is too often ineffectual, and the patient succumbs to progressive liver failure, in addition to wasting ascites and/or exsanguination, with one or more repeated bouts of bleeding from esophageal varices. The inability to judge clinically and by liver function tests the degree of irreversible damage in the parenchyma of the liver and, thus, the extent of the departure from normal and the reduction of liver function often makes it impossible for the surgeon to determine preoperatively the severity of the operative risk with which he is faced.

The problem that confronts the surgeon is gradual failure of the patient because of wasting ascites and/or exsanguination caused by bleeding from esophageal or gastric varices. For many years, correction of these two complications by operative measures has been the surgical goal. The results of the many and varied procedures that have been suggested in the past have been gratifying, the patient has been restored to a life of activity in numerous instances. In many other instances, however, disappointing failure has been experienced.

There exists today a great difference of opinion as to the proper surgical methods to be employed in the treatment of ascites and bleeding esophageal varices, and this lack of unanimity of opinion will certainly continue until surgeons are able to determine the true hepatic function and, thus, the condition of the patient by laboratory procedures or liver function tests that are more accurate than those at hand today. At the present time, regardless of the operation employed, the postoperative course is unpredictable, and any attempt to foretell the outcome, on the basis of preoperative or postoperative liver function tests or the gross and microscopic appearance of the liver is prone to error.

As an indication of the lack of uniform success attending surgical treatment, we might cite the number and variety of procedures utilized in the past. Direct cauterization of esophageal varices by the injection of solutions causing sclerosis, resection of the lower end of the esophagus, ligation of the splenic artery with or without splenectomy, creation of a connection between portal and systemic circulation, such as splenorenal or porta-caval shunts, and omentopexy (Talma operation) have all raised the hope that a definitive solution of this problem had been accomplished. These procedures have

often failed in critically ill patients, primarily because of insurmountable technical difficulties.

The purpose of this paper is to present further clinical experiences in the treatment of ascites and hemorrhage from esophageal varices resulting from cirrhosis of the liver by ligation of various branches of the arterial supply to the liver and spleen. In a preliminary report, one of us¹ described six patients so treated. This paper describes 23 patients operated on since 1947 and adequately followed.

PREOPERATIVE PREPARATION

The patients on whom we operated were all suffering from uncontrolled, wasting ascites, hemorrhage from esophageal varices, or both. Each patient had previously been treated by medical means and was presented for surgical consideration after failure of medical management was evident. Each patient was extensively studied prior to operation in an attempt to assay accurately the liver function, and each was considered to be in the poor risk category. All were given antibiotics, penicillin and aureomycin, for at least five days preoperatively. Bleeding, if present, was controlled with a Sangstaken tube and blood lost was replaced with whole blood to a minimum of 12 gm of hemoglobin per 100 cc. Though we preferred to operate when there was no evidence of hemorrhage, surgery was performed during a hemorrhagic episode in several patients. Patients with massive ascites were subjected to paracentesis one or two days prior to operation.

OPERATIVE TECHNIQUE

Cyclopropane anesthesia was the anesthesia of choice in these patients because of its high oxygen content and rapid induction and because it allowed the patient to return to consciousness before leaving the operating room. It is felt that in a patient with a damaged liver thiopental sodium, ether, or even nitrous oxide might have deleterious effects.

A high upper midline incision was preferred, although a transverse incision was employed in some instances. Both give adequate exposure. In the majority of patients, there was a large collection of ascitic fluid that was first siphoned off completely. The peritoneum was always thickened and did not have the usual sheen, indicative of chronic peritonitis. After removal of the ascitic fluid and freeing of adhesions, if present, the liver was inspected. The gallbladder was usually distended and enlarged, and the hilar lymph nodes were grossly enlarged, as were the

lymphatic channels about the hilum of the liver and along the common duct. To a greater or lesser degree, there were extraperitoneal dilated varicose veins of different sizes that appeared to be collateral venous circulatory channels between the portal and the caval systems. It was rarely difficult to control bleeding from this source during the dissection of the branches of the celiac axis. The index finger was placed in the foramen of Winslow, and the common hepatic artery was palpated in the gastrohepatic ligament. In all but a few persons, this vessel was enlarged over two and one-half times its normal size, tortuous, and thin walled, a definite thrill could be felt that indicated, it seemed to us, a marked increase in arterial blood flow. Next, the gastroduodenal artery was identified in juxtaposition to the posterior surface of the first portion of the duodenum. This vessel was then traced cephalad to its parent trunk, the common hepatic artery. The gastroduodenal artery arises from the common hepatic artery, regardless of whether this latter vessel arises from the celiac axis or from the superior mesenteric artery, a relatively common variation. The departure of the gastroduodenal artery from the common hepatic artery forms an arch beneath which the portal vein passes in oblique direction. Identification of these vessels, therefore, enables the surgeon to measure the pressure in the portal vein. We used an ordinary spinal manometer filled with saline solution for this purpose or a more accurate strain gage manometer attached to a commercial Hathaway oscillograph equipped with a camera for permanent recording. Portal pressures, in those patients in whom we measured them, were in the range of 400 mm H₂O or above. We thought it essential to make all measurements of portal pressure at this stage of the operation, because, as the dissection is carried further toward the celiac axis, numerous collateral branches of the portal veins are encountered and are frequently divided and tied, rendering measurements possibly inaccurate. In the first six patients, the common hepatic artery was ligated distal to the departure of the gastroduodenal artery, however, in the other patients, additional ligatures were placed on the hepatic artery proximal to the gastroduodenal artery in order to prevent the development of collateral circulation through this vessel from the superior mesenteric artery. In those patients with ascites alone, the splenic artery was ligated as well as the hepatic artery. In those in whom bleeding occurred, the left gastric artery was doubly ligated as well as the hepatic and splenic arteries.

If difficulty is experienced in locating the common hepatic artery by palpation, this can best be accomplished by placing the index finger in the foramen of Winslow and determining the area of pulsation in the gastrohepatic ligaments by pressure between the thumb and index finger. As a rule, a thrill can be elicited because of enlargement and increased blood flow through the common hepatic artery. In two of the patients in whom it was difficult to dissect out the branches of the celiac axis, the common hepatic artery was ligated at the level of the foramen of Winslow. This, of course, placed the ligatures distal to the departure of the gastroduodenal artery and prevented the development of any collateral circulation from this source. The lesser peritoneal cavity was then exposed through the gastrocolic omentum, and the

splenic artery was located along the superior border of the pancreas and doubly ligated. This method of ligating the branches of the celiac axis somewhat distal from their origin may be helpful in accelerating the operating time.

Pressure measurements in the portal vein were made after the arterial ligation and liver biopsy. In all patients fresh bleeding was still encountered from the cut edges of the liver and was controlled by suture as in a normal person. The wound was then closed. The usual operating time was approximately one to one and one-half hours.

POSTOPERATIVE COURSE

Postoperatively, the patients were given antibiotics for from 10 days to two weeks. Fluids were given intravenously, and blood transfusions were given when indicated. Fluids were given orally immediately after surgery, and, if necessary, paracentesis was resorted to as indicated. Paracentesis should not be performed more often than necessary not only because of the waste of protein but also because frequent tapping seems to encourage the re-formation of ascitic fluid more rapidly. Postoperative hospitalization ranged from 10 days to a month.

RESULTS

The over-all mortality in this series of 23 patients was 30.4%. Six patients died in the immediate postoperative period while they were still in the hospital, and one died three months after operation of recurrent hemorrhage from esophageal varices. All of the patients who died in the hospital were studied at autopsy. Two deaths, including the one that occurred outside the hospital, were clearly due to continued hemorrhage. One patient died of cardiac failure and pneumonia of the left lower lobe. The other patients died of less distinct causes. We attributed death in two patients to progressive liver failure caused probably by alteration of the circulation in rapidly advancing cirrhosis. Both of these patients showed clinical and chemical evidence of a gradual loss of liver function after operation. Oliguria developed in both, and both died in coma. The death of one patient was attributed to uremia, oliguria developed, and the man died with a high nonprotein nitrogen level, although results of liver function studies did not change appreciably from the preoperative values. The cause of death in one patient was not determined. He died 18 hours after operation, without regaining consciousness. An autopsy failed to reveal any cause of death. He had had a convulsion just before he died, and it was assumed he might have had a cerebrovascular accident, but we could not obtain permission to examine the brain. In these patients, the microscopic appearance of the liver at post mortem did not vary from the tissue obtained by biopsy at the operating table. We observed no gross infarction of the liver. There were microscopic areas of central lobular necrosis of the liver in three patients, but these areas were small and had been seen in the surgical biopsies at the time of operation.

Although all of the 23 patients were thought to have Laennec's cirrhosis clinically, there were two diagnostic errors found at operation. One patient who was thought to have cirrhosis with intractable ascites was found to have extensive carcinomatous metastases in the liver from a lesion in the esophagus. The hepatic artery was ligated in the hope that cutting down the oxygen satura-

tion of the blood reaching the metastases would retard growth. The patient survived and left the hospital improved as far as ascites was concerned. He was still improved three months after operation, with normal liver function, but has not been heard from since. Another patient with a large nodular liver and ascites was found to have huge multiple hemangiomas. Hepatic and splenic artery ligation was done in the hope that ascites might be reduced. The patient is living and well 20 months after operation and no longer has demonstrable ascites, despite the fact that she has had no other treatment. The other 21 patients had periportal cirrhosis that was proved microscopically.

COMMENT

We have, then, 16 patients who survived hepatic artery ligation, with additional ligation of the splenic artery in most of the patients with ascites and of the splenic and left gastric arteries in those with bleeding esophageal varices. Eliminating the patient with carcinoma of the esophagus, 15 patients remain as a determinate group. They were observed for a period varying from several months to six years after surgery. All are improved. Two patients, who were operated on because of bleeding, had subsequent small hematemeses. In neither was this bleeding as massive or as fulminant as prior to operation. One patient, who hemorrhaged to shock levels several times prior to hepatic artery ligation, has had several small hemorrhages since but none massive enough to require transfusion. All of the patients with ascites are improved. The degree of improvement ranges from that in several patients in whom all evidence of ascites is absent to that in a man who requires paracentesis at intervals of six weeks to two months in contrast to once a week before operation.

This number of patients is obviously too small for statistical analysis. It is interesting to note, however, that 13 patients presented themselves for operation primarily because of ascites. Of this group, 2 are dead and 11 are improved, a mortality rate of about 16.3%. Ten were operated on primarily for hemorrhage. Of this group, five are dead and five are alive, a mortality rate of 50%. Of the five dead, only two died of continued bleeding. Two of those who survived have had small but definite recurrent hemorrhages. The presence of ascites in cirrhosis, therefore, is not considered a contraindication for hepatic artery ligation, and, in this group of patients, ligation was apparently successful in reducing intractable ascites.

Comparison of preoperative and postoperative liver function studies shows no common pattern of change in these patients. Four patients who were jaundiced prior to operation showed a rise in serum bilirubin and alkaline phosphatase levels after hepatic artery ligation. Two of those patients died, the two whose death was attributed to progressive liver failure. One patient became deeply jaundiced after operation, but this began to clear after two weeks, and she has been free from clinical jaundice for many months. The fourth patient who had a marked increase in serum bilirubin after operation has been studied on several occasions at the Mayo Clinic. Each time there has been a slight elevation of the serum bilirubin, but clinical jaundice has not been noted. Thymol turbidity and cephalin flocculation tests have shown higher values postoperatively in several patients.

Perhaps the most significant chemical change noted has been an increase in total serum protein and return to nearly normal of the albumin-globulin ratio in several instances. This is probably a reflection of the decrease in ascites and waste of protein in ascitic fluid. The prothrombin time has improved postoperatively in several patients. The sulfobromophthalein (Bromsulphalein) retention has remained unchanged in one patient and has decreased in another. Unfortunately, follow-up blood chemistry studies are not available for many of these patients.

Portal venous pressure measurements were not determined postoperatively in these patients, for we have had no reason or opportunity to subject any of them to another laparotomy. We believe, however, that the portal hypertension is probably significantly reduced in some of the patients. This is because of reduction of size of the esophageal varices and other collaterals in some of the patients and because of the change in character and amount of bleeding in the two patients still alive who had postoperative hematemesis. In both of these patients, postoperative bleeding was small or occult, whereas prior to operation it was massive and exsanguinating. Probably portal hypertension was not relieved in those patients who bled to death through hematemeses after operation.

SUMMARY AND CONCLUSIONS

Our results appear to show that the greatest benefit from ligation of the common hepatic and splenic arteries occurs in those patients with intractable ascites only. When the common hepatic, splenic, and left gastric arteries were ligated to prevent further bleeding from esophageal varices, the results were, to say the least, equivocal and certainly not as favorable as the results in the patients with ascites alone.

In an effort to explain the beneficial effects of diminishing the arterial blood flow to the liver, it occurred to us that the production of ascites was mainly a result of chronic passive congestion of the liver, with a marked increase in the flow of lymph from the liver. The mechanism of the production of portal hypertension, which almost always must precede the development of esophageal varices, may vary from that producing ascites. We observed in all of the patients with ascites that lymphatic fluid from the dilated lymphatic vessels and enlarged lymphatic glands dripped, as a transudate, from the hilum of the liver. The chronic passive congestion of the liver in these cirrhotic patients develops, we believe, as a result of the normal reparative processes. Liver tissue is regenerated not in its normal lobular pattern but in irregular nodules between inelastic scars. This haphazard growth of new liver tissue and old scar tissue interferes with the outflow of blood through the efferent hepatic veins by causing pressure on these veins. The liver becomes overloaded with blood from the afferent vessels, the total of the normal blood flow through the portal vein plus the apparently increased blood flow through the hepatic artery. Diminishing the blood flow to the liver by blocking the hepatic arterial flow and removing the contribution of the splenic artery to the portal venous flow seemed to us, therefore, a logical procedure.

Although our observations of the patients in whom the portal pressures were measured show that ligation

of the hepatic and splenic arteries causes a drop in portal pressure, we have no proof that this drop is sustained over any length of time. Ligation of the branches of the celiac axis undoubtedly causes changes in the blood flow through the liver but may not produce a sufficient drop in portal pressure to protect the patient completely from further hemorrhage. Although it is difficult to draw conclusions from this small series of patients, we believe that for the patient with ascites alone ligation of the hepatic and splenic arteries is the operation of choice. Our results in patients with bleeding esophageal varices were not as successful as in those with portacaval shunts.

There were no instances of gross liver necrosis in this series, and we think that, with the preoperative preparation of the patients with antibiotics, they will survive ligation of the common hepatic artery. Ligation of the common hepatic artery at the level of the foramen of Winslow distal to the departure of the gastroduodenal and the splenic arteries in the lesser peritoneal cavity along the superior margin of the pancreas eliminates a great deal of the difficulty and the time-consuming dissection of the celiac axis. The ligation of these vessels would seem to be sufficient for either the cure or the amelioration of ascites. We feel that double ligation of the arteries is sufficient and that division of the vessels is not necessary. We believe that ligation of the hepatic artery should not be done proximal to the departure of the gastroduodenal artery but distal to that departure to avoid development of a collateral circulation through the distal hepatic artery from the gastroduodenal artery, which would nullify any benefits from ligation of the common hepatic artery.

We believe that the occasional increase in jaundice and serum bilirubin after ligation of the arterial branches may be due to edema and loss of the squamous character of the epithelium in the intrahepatic bile ducts. These ducts receive their blood supply from the branches of the hepatic arteries. A temporary obstructive jaundice is, therefore, superimposed on a cirrhotic condition, which would explain the postoperative increase in the blood phosphatase and serum bilirubin. Even in the very poor risk patient, whether ligation of the arterial supply to the liver will prove to be efficacious in controlling bleeding from esophageal varices is still unproved. It is to be emphasized that all patients treated in the series were, clinically and from the standpoint of liver function studies, in the poor risk category. There was no selection of patients, because it is well known that of those suffering from hemorrhage due to esophageal varices 80% will be dead within a year to one and one-half years, if not operated on. In the patients in this group who died because of continued bleeding, ligation of the esophageal varices in the esophagus was not done. Perhaps this procedure should be employed in all instances of severe bleeding before either ligation of the arterial supply to the liver or some form of portacaval shunt is undertaken. At this time we feel that one should be cautious about drawing any conclusions until many further clinical studies and experimental observations have been made. At the same time, however, it would seem that ligation of the hepatic and splenic arteries is of definite benefit in patients with ascites alone, and we feel that this procedure should be continued so that its value may be firmly established.

FAILURE OF CONVALESCENT GAMMA GLOBULIN TO PROTECT AGAINST HOMOLOGOUS SERUM HEPATITIS

*Miles E Drake, M D , Jeremiah A Barondess, M D , Winslow J Bashe Jr , M D , Gertrude Henle, M D
Werner Henle, M D , Joseph Stokes Jr , M D , Philadelphia*

and

Robert B Pennell, Ph D , West Point, Pa

Reports on the efficacy of gamma globulin (immune serum globulin) prepared from normal adult human serum in the prevention of homologous serum hepatitis (viral hepatitis B), while indicating some prolongation of incubation period¹ or some degree of protection against the disease in battle casualties who have been given transfusions,² have provided evidence that this

material is considerably less potent in prophylaxis against this disease than against infectious (epidemic) hepatitis (viral hepatitis A). In addition, a previous attempt^{1b} to neutralize homologous serum hepatitis virus in icterogenic serum with 20 ml of normal gamma globulin was unsuccessful. In view of the frequency and importance of the problem of homologous serum hepatitis, effective prophylactic measures would be of great value in making the administration of blood or blood products safer. Since there does not exist at present a satisfactory method for inactivation of hepatitis virus in these materials before injection, and in view of the high degree of protection afforded by gamma globulin in infectious hepatitis,³ further exploration of the efficacy of this material in homologous serum hepatitis appeared to be of value.

Since the number of persons in the general population who have had homologous serum hepatitis is probably relatively small, it was felt that the comparatively low

degree of protection against this disease and the failure of neutralization afforded by gamma globulin prepared from plasma pools drawn from the population at large might reflect low titers of antibodies against homologous serum hepatitis in such pools. It was considered, therefore, that gamma globulin prepared from plasma pooled from patients convalescent from homologous serum hepatitis might contain larger amounts of antibodies and thus afford passive protection against the disease. Consequently, such a preparation was obtained and its value studied in two sets of experiments in volunteers. 1 A protection test was conducted, in which the specially prepared gamma globulin was administered intramuscularly at the same time that infected whole blood was administered intravenously and again four weeks later. This test was designed to simulate the common situation in clinical practice, in which patients become infected during the intravenous infusion of whole blood or plasma contaminated with the virus. The protection test was extended to an additional group of volunteers who received icterogenic serum intramuscularly, this group also received gamma globulin twice by the same route. 2 A neutralization test was also done, in which infectious serum was mixed *in vitro* with the specially prepared gamma globulin and the mixture, after incubation, was injected intramuscularly into volunteers.

MATERIALS AND METHODS

A plasma pool was prepared from male volunteers, convalescent for periods varying from four months to six years from experimentally induced homologous hepatitis with jaundice due to the Fort Bragg strain of the virus (see table 1). This pool was fractionated and gamma globulin prepared by the method of Cohn and Oncley and their co-workers.⁴ This is the same technique that has been used in this country in the preparation of the various lots of Red Cross gamma globulin, which have afforded high degrees of protection against hepatitis A.³ Gamma globulin preparations thus prepared represent, as a rule, twentyfold to twenty-five-fold concentrations of antibodies, as compared to the titers of the original plasma pools, when tests for commonly present and detectable antibodies are employed in the evaluation.⁵ The preparation of convalescent gamma globulin used in these studies was stored at 4 C until used.

In the first experiment (1A) the whole blood used for infection was obtained from a volunteer at the onset of his illness, 74 days after inoculation with icterogenic material. This blood, taken during the acute stage, represented the third experimental human passage of the Fort Bragg strain of homologous serum hepatitis virus. In the second and third experiments (1B and 2) the serum used represented the second experimental human passage of the Fort Bragg strain and was obtained from a volunteer at the onset of his illness, 77 days after inoculation with icterogenic material. In neither of these materials was the amount of virus per milliliter of inoculum known.

Equal volumes of gamma globulin and infectious serum (diluted 1:50 in sterile broth) were mixed in a test tube yielding a final dilution of serum of 1:100. This mixture was incubated at 37 C for 1 hour and then at 4 C for 20 hours prior to administration. Control preparations of gamma globulin mixed with broth and of infec-

tious serum diluted 1:100 were incubated at the same time.

The volunteers were healthy, young institutionalized men between 18 and 35 years of age. The methods used in the volunteer studies have been described previously.⁶

EXPERIMENTS

Experiment 1A—In simulation of the common clinical mode of infection with homologous serum hepatitis, and in order to determine whether the specially prepared gamma globulin might protect against the transmission of the disease by transfusion, each of 11 volunteers received 50 ml of infectious type O whole blood by the intravenous route. Five of these men (group 1) served as controls, the other six (group 2) received 2 ml of gamma globulin intramuscularly at the time of transfusion and again 40 days later.

Experiment 1B—In view of the possibility that the amount of antibody in the gamma globulin used in ex-

prepared gamma globulin intramuscularly in the opposite arm. This dose of globulin was repeated 40 days later.

Experiment 2—Study of the *in vitro* neutralizing ability of the specially prepared gamma globulin was carried out as follows. Each of four volunteers (group 5) received 4 ml of a 1:100 dilution of infectious serum intramuscularly. Four additional volunteers (group 6) received intramuscularly 4 ml of a mixture of the specially prepared gamma globulin and diluted infectious serum, prepared and incubated as described. The final dilution of infectious serum was 1:100. Finally, each of four volunteers (group 7) received 4 ml of the specially prepared gamma globulin intramuscularly, to demonstrate the presence or absence of homologous serum hepatitis virus in the globulin used.

RESULTS

The results of these experiments are summarized in table 2. It will be seen that cases of hepatitis occurred in all groups of volunteers except group 7, and that, considering the 28 volunteers at risk in the other six groups, the over-all incidence of hepatitis with jaundice was

this result exist. Circulating antibodies after the occurrence of homologous serum hepatitis may exist in some fraction of the plasma other than the gamma globulin fraction. In this connection, it has been demonstrated^{1b} that typhoid O antibodies and antibodies against pneumococci and plague bacilli in animals are found in Cohn's "Fraction III-1." On the other hand, Stokes and his co-workers^{1b} have reported a negative neutralization test when using whole plasma taken from a volunteer two and one-half months after his recovery from experimentally induced homologous serum hepatitis. This would suggest the absence of neutralizing antibodies in the plasma used. Unfortunately, the small volume of data bearing on this point precludes final conclusions. Further examinations of single serums may clarify this possibility.

Antibody may have been present in the gamma globulin used in these studies but may have been inadequate in titer, and the dosage used may have been too small to protect against or neutralize the amounts of virus in the infectious materials employed. The high proportion of volunteers in whom hepatitis developed, and especially the fact that in 50% of those at risk in groups 1, 2, 3,

TABLE 2—Results of Protection and Neutralization Tests in Volunteers

* Gamma globulin

50%, while that of anicteric hepatitis was 18%. The incubation periods observed were characteristic of homologous serum hepatitis and ranged from 43 to 134 days, with a mean of 86 days.

It is perhaps of some interest that in group 6, in which neutralization was attempted, and in which there were two cases of hepatitis with jaundice and one case of anicteric hepatitis, the incubation periods of all three cases were relatively long, i.e., 113, 119, and 134 days, as compared with the usually shorter incubation periods of the cases in the other groups. It will be noted, however, that one patient in group 2 had an incubation period of 107 days, and one patient in group 5, the group that received diluted infectious serum as the inoculum, had an incubation period of 112 days. Thus, the apparent prolongation of incubation period noted in group 6 may reflect either the natural range of incubation periods with this strain of the virus or may be due merely to dilution of the virus, as used in groups 5 and 6.

COMMENT

The specially prepared gamma globulin, in the dosage used in this study, when employed in both protection and neutralization tests, failed to prevent homologous serum hepatitis in volunteers. Several possible explanations for

4, 5, and 6 hepatitis with jaundice developed, may indicate that high titers of virus were present in the blood and serum used, although this could also reflect the virulence of the strain. On the other hand, it might be expected that dilution of the infectious serum to 1:100 with gamma globulin would, to some extent, reduce this possibility. As noted, the apparent prolongation of the incubation period in group 6 may represent only the natural range of incubation periods with this strain, or an effect due to dilution of the virus, rather than a more favorable ratio between gamma globulin and number of infectious units, with resulting neutralization.

Antibodies may appear in the circulation after recovery from homologous serum hepatitis but may be lost relatively soon, so that plasma pools from persons more than a few months convalescent would not contain high titers. It should be noted that the mean length of convalescence of the donors contributing to the fractionated plasma pool for this study was 47.6 months, however, it should be pointed out in this connection that immunity to this disease may not be solid, even relatively early in convalescence. Thus, Neefe, Stokes, and Gellis,⁷ on re-challenging nine volunteers recently convalescent from experimentally induced homologous serum hepatitis,

found transient mild symptoms and/or laboratory findings "suggestive of transient hepatic disturbance" in five of the nine, although none of these men became jaundiced as a result of the rechallenge. Similar results have been obtained more recently⁸ in volunteers who were five months to six and one-half years convalescent at the time of challenge. On this basis, one might assume, in interpreting the protection against homologous serum hepatitis by normal gamma globulin that has been reported, that, by chance, the plasma pools from which those globulins were prepared contained a relatively high proportion of recent homologous serum hepatitis convalescents. Since such plasma pools may represent 2,000 or more donors, and in view of the relatively low incidence of this disease in the population at large, such a circumstance would appear to be highly improbable.

Homologous serum hepatitis may not cause the production of circulating antibodies in appreciable amounts, and the degree of homologous immunity that has been demonstrated may reflect the presence of fixed tissue antibodies or some other form of tissue resistance. Antibodies against this disease may be altered or destroyed in the fractionation process. This has not been demonstrated in the case of antibodies against other infectious agents and certainly does not appear to occur in the case of infectious hepatitis.

Although the incidence of a blood stream carrier state after apparent recovery from homologous serum hepatitis is unknown, there is evidence⁹ that this may occur after inapparent infection. Thus, the remote possibility exists that if one or several of the contributors to the gamma globulin preparation used in this study had been carriers, the virus might have combined with antibody in the pooled plasma before fractionation, with the result that

the remaining antibody, in the gamma globulin fraction, would have been insufficient to protect or neutralize in the challenge experiments. The apparent absence of homologous serum hepatitis virus from the gamma globulin prepared for this study accords with previous experience,¹⁰ demonstrating the safety of this material as far as contamination with this virus is concerned.

SUMMARY

Gamma globulin prepared from the blood of homologous serum hepatitis convalescents, in the dosage used, did not protect volunteers against the disease after injection with an unknown amount of virus as contained in blood or serum obtained during the early acute stage of illness from other volunteers. Attempts to neutralize the virus in icterogenic serum with this gamma globulin preparation also failed. Explanations for this failure of protection and neutralization are discussed. The gamma globulin used failed, by itself, when administered intramuscularly, to induce viral hepatitis. Of 28 volunteers receiving the Fort Bragg strain of homologous serum hepatitis, virus hepatitis with jaundice developed in 50% and anicteric hepatitis in an additional 18%.

SUBSEQUENT CAREERS OF APPLICANTS FOR POSTDOCTORAL MEDICAL RESEARCH FELLOWSHIPS

Lois G. Bowen, M A, Washington, D C

In 1922, the Rockefeller Foundation established a program of fellowships in the medical sciences under the administration of the medical fellowship board, National Research Council. Comparable programs in the physical and biological sciences were initiated in 1919 and 1923, respectively, with the support of the foundation. These fellowships were designed to provide experience at the postdoctoral level for persons with promise in research and teaching. It was anticipated that fellows would undertake academic careers and would play an important role in the development of future investigators. Since an adequate number of fellowships has been granted and sufficient time has elapsed to permit analysis, it seems pertinent to evaluate the results of the Rockefeller Foundation-National Research Council medical research fellowship program. A preliminary survey of past fellows and rejected applicants has, therefore, been made for the purpose of comparing the subsequent careers of these two groups.

The following general question formed the basis of the evaluation. Do past fellows differ significantly from

rejected applicants with respect to subsequent success in academic and research work, as indicated by the positions they now hold? From this analysis of the total group of applicants, a supplementary problem arises, i.e., to what extent are the results affected by controlling the following factors: field of interest, nature of doctorate, other fellowships held by rejected applicants, sex, age, and selection ratio? Should the first general question be answered in the affirmative, a second might be asked. To what degree has the method employed produced better results than would have been obtained by use of a chance mechanism?

METHOD AND MATERIAL

During its 30 years of activity, the medical fellowship board has reviewed more than 2,500 applications and has awarded about 450 fellowships. The program was

This study was supported by a grant to the National Research Council from the Rockefeller Foundation.

This work was done in partial satisfaction of the requirements for the degree of Master of Arts at George Washington University.

restricted during World War II by the dearth of qualified applicants, and data for this period probably are not typical. Since evaluation of awards made since the end of the war should be deferred for several years, this study was limited to the 1,136 persons who applied for fellowships in the medical sciences during the 20-year period 1922 through 1941.

TABLE 1—Comparison of Careers of the Total Groups of Past Fellows and Rejected Applicants

Criterion	Fellows (Total = 265)		Applicants Rejected (Total = 707)		P *
	No	%	No	%	
Listing in American Men of Science	221	83.4	331	46.8	<0.001
Listing in Medical Sciences Information Exchange	114	43.0	137	19.4	<0.001
University appointments	197	74.3	396	56.0	<0.001
Academic positions	110	41.4	180	25.6	<0.001
Professorships	49	18.5	54	7.6	<0.001
Senior academic positions	104	39.3	140	19.8	<0.001
In practice	30	11.3	195	27.6	<0.001
Without concurrent university appointment	15	5.7	118	16.7	<0.001

* P = the probability that a difference of the magnitude indicated would occur as the result of chance factors alone.

Choice of Criteria—After preliminary analysis, several objective criteria were selected. While it was recognized that no one of these alone would be a wholly satisfactory index, it was felt that, taken in combination, they would serve as the best available yardstick for evaluation of the program. These criteria are as follows:

1. Inclusion in "American Men of Science." Since the most recent of these fellowships began in 1941, the youngest fellows completed them six years before the 1949 edition of "American Men of Science" was compiled. It would be anticipated, therefore, that the entire group would have had an opportunity to attain the recognition implied by inclusion in this volume.
2. Listing by the Medical Sciences Information Exchange. The Medical Sciences Information Exchange was established in 1946 by the U. S. Public Health Service and was transferred to the National Research Council in 1950. At the present time, its records include data concerning research grants awarded since 1946 by the six government agencies concerned with medical and biological research and by about 50 private foundations operating in these fields. This record was consulted to determine the proportion of fellows and rejected applicants who were principal investigators under the grants.
3. University Positions. This category includes all persons holding part-time or full-time clinical or academic appointments. The group in university work also was analyzed in terms of the following more specific categories: (a) academic positions, this category is limited to full-time university appointments, and clinical positions have been eliminated; (b) professorships, this includes only full-time academic appointments; (c) senior academic positions, consisting of full-time academic appointments as deans, heads of departments, professors, and associate professors.
4. Private Practice. This negative criterion was analyzed in terms of the proportions of the two groups in

full-time practice regardless of whether they held other appointments as well. Those in practice without concurrent university appointments were included in this category and also were analyzed separately.

Sources of Data—A major portion of the data was obtained by means of a questionnaire sent to the 1,136 persons included in the survey. Information from this source was supplemented by data from the files of the fellowship board and, as indicated, from "American Men of Science" and the Medical Sciences Information Exchange.

Statistical Method—Past fellows and rejected applicants were compared with respect to the criteria listed by determining the significance of the difference between the proportions of each group falling in a given category. The technique recommended by McNemar¹ for dealing with the difference between independent proportions was followed. Yates' correction was applied to all computations. For purposes of this analysis, a probability level of 0.01 or less was accepted as representing a significant difference; however, probability values ranging between 0.001 and 0.05 are reported for the information of those holding more or less rigorous views.

In an attempt to determine the degree to which the method employed has been more effective than a chance mechanism, a procedure has been devised for estimating its efficiency. The number of fellows who would have been expected to appear in each criterion category as a result of the use of a chance mechanism was computed. Using this expected frequency as a base line, the increase achieved by the present method was determined as well as the maximum increase possible had a perfect method been available. The ratio of the actual to the potential increase, expressed in percentages, was defined as an "index of efficiency." This index provides a measure of performance that is not dependent on the number of cases involved, whereas the probability levels are influenced by the size of the sample as well as the effectiveness of the program.

TABLE 2—Comparison of Careers of Past Fellows and Rejected Applicants Now Working in Preclinical Fields

Criterion	Fellows (Total = 124)		Applicants Rejected (Total = 207)		P
	No	%	No	%	
Listing in American Men of Science	117	94.4	205	79.8	<0.001
Listing in Medical Sciences Information Exchange	65	52.4	79	30.7	<0.001
University appointments	92	74.2	150	58.4	<0.01
Academic positions	79	63.7	131	51.0	<0.05
Professorships	29	23.4	38	14.8	>0.05
Senior academic positions	70	56.5	99	38.5	<0.01

RESULTS

Of the 1,136 persons to whom the questionnaire was sent, 998 (87.9%) replied. Questionnaires were returned by 265 (97.1%) of the 273 past fellows, 707 (84.6%) of the 836 whose applications were not successful, and 26 (96.3%) of the 27 who did not accept the appointments offered them.

Total Group—The results obtained by comparing the careers of all past fellows with those of all rejected appli-

cants are shown in table 1. The data indicate that, for each of the eight criteria, the differences between the two groups are highly significant. Moreover, these differences all suggest that past fellows have surpassed rejected candidates with respect to these indexes. Analysis of the universities in which the two groups hold positions indicates that both fellows and rejected candidates have

TABLE 3—Comparison of Careers of Past Applicants* Working in the Preclinical Field and Those in the Clinical Field†

* Includes both fellows and rejected applicants.

† The interests of 20 past applicants could not be categorized as clinical or preclinical on the basis of the information submitted. Most of these were engaged in administrative work or had retired.

obtained positions in the major universities in this country.

Field of Interest—The sample was dichotomized on the basis of whether the major field of interest was clinical or preclinical. The clinical group included 136 fellows and 435 rejected applicants, while 124 and 257, respectively, were classified as preclinical. When fellows and rejected candidates in the clinical area were compared, the results were essentially the same as those for the total group, with all probability values falling below 0.001. Table 2 indicates that the pattern for the group with preclinical interest differs in certain respects from that for the total group, especially in the analysis of academic positions and full-time professorships. Failure to find highly significant differences between fellows and rejected applicants for these two criteria is associated with a relatively high standing for the combined groups in the preclinical as compared with the clinical field. Table 3 compares the total clinical and preclinical groups and indicates differences of a high order of significance for five of the six indexes.

Individual Fields—The pattern for the field of medicine resembles that for the entire group and for the clinical field, with two exceptions. The difference between the proportion of fellows and rejected applicants holding full-time academic positions is not highly significant, and the difference between the proportions of the two groups in full-time practice is significant only at the 0.02 level of confidence. In the field of surgery, most of the obtained differences are significant at the 0.01 rather than the 0.001 level. The pattern for the surgical group differs considerably from that for the clinical group only in the failure to show a true difference between the proportions of fellows and rejected applicants engaged in practice.

In the preclinical fields of biochemistry, pathology, and physiology, the established criteria did not distinguish between the two groups with any degree of consistency. There were no highly significant differences in biochemistry or physiology, although a few were found

to be significant at the 0.02 or 0.05 level of confidence. In pathology, differences significant at the 0.01 level or above were obtained for three of the indexes (inclusion in "American Men of Science," listing in Medical Sciences Information Exchange, and senior academic positions). The trend away from true differences between fellows and rejected applicants, indicated in table 2 for the preclinical group, thus is intensified when this area is divided into separate disciplines.

Doctorates—The survey included 151 fellows and 402 rejected applicants who hold the M.D. and no other doctoral degree. There were 65 fellows and 199 rejected applicants holding only the doctorate in the basic sciences. These two groups were analyzed separately. The pattern for the M.D. category was comparable to that obtained for the clinical breakdown. Differences between past fellows and rejected applicants were significant at the 0.001 level for all criteria. When past fellows and rejected applicants holding only the doctorate in the basic sciences were compared, the difference in the proportion listed in "American Men of Science" was found to be significant at the 0.02 level. All other probability values were greater than 0.05. Thus, the results for this group resemble those for the preclinical fields of biochemistry and physiology.

Fellowships Under Other Auspices—Seventy-one past fellows and 274 rejected applicants reported that they had held fellowships under other auspices. The rejected applicants who had held such fellowships were compared with those who had not, the results are shown in table 4. A larger proportion of those who had held other fellowships were listed by the Medical Sciences Information Exchange, and the difference was significant at the 0.01 level. No other significant differences were found. Table 5 compares the rejected applicants who had held other awards with the total group of past fellows.

TABLE 4—Comparison of Careers of Rejected Applicants Who Held Fellowships Under Other Auspices and Those Who Did Not

Criterion	Held Other Fellowships (Total = 274)		Held No Other Fellowships (Total = 433)		P
	No	%	No	%	
Listing in American Men of Science	136	49.6	183	42.0	>0.05
Listing in Medical Sciences Information Exchange	67	24.4	70	16.2	<0.01
University appointments	168	61.3	228	52.7	<0.05
Academic positions	81	29.6	104	24.0	>0.05
Professorships	22	8.0	32	7.4	>0.05
Senior academic positions	61	22.3	79	18.2	>0.05
In practice	74	27.0	121	27.9	>0.05
Without concurrent university appointment	38	13.9	80	18.5	>0.05

The differences between these two groups were significant in every criterion category, providing a clear-cut contrast to the results in table 4.

Age and Sex—Women constituted less than 8% of the sample surveyed. Their elimination from the total group did not alter essentially the results shown in table 1. The mean age of past fellows was 50.20 years (standard deviation = 6.49), and that of rejected applicants was 48.08 (standard deviation = 6.74). This difference in ages is significant at the 0.001 level of con-

fidence To hold constant the factor of age, a sample was selected in the following manner Within each three year age group, cards were chosen on a random-sampling basis in the ratio of three rejected applicants to one fellow In the sample thus selected, there were 207 fellows and 620 rejected applicants The mean age for fellows was 48.91 (standard deviation = 6.56) and for

TABLE 5—Comparison of Careers of the Total Group of Past Fellows with Those of Rejected Applicants Who Held Fellowships Under Other Auspices

Criterion	Fellows (Total = 205)		Rejected Applicants Who Held Other Fellowships (Total = 274)		P
	No	%	No	%	
Listing in American Men of Science	221	83.4	136	49.6	<0.001
Listing in Medical Sciences Information Exchange	114	43.0	67	24.5	<0.001
University appointments	197	74.3	168	61.3	<0.01
Academic positions	115	43.4	81	29.6	<0.01
Professorships	49	18.5	22	8.0	<0.001
Senior academic positions	104	39.3	61	22.3	<0.001
In Practice	35	13.2	74	27.0	<0.001
Without concurrent university appointment	15	5.7	38	13.9	<0.01

the others, 48.80 (standard deviation = 6.54) When this group was analyzed it was found that differences were significant at the 0.001 level for all criteria

Selection Ratio—The selection ratio was about five to one in the second decade of the program as compared with two to one in the first decade The two decades were analyzed separately, and in both instances significant differences between past fellows and rejected applicants were found for all indexes The difference in selection ratio was not accompanied by significant change in the relative status of fellows and rejected candidates with respect to the criteria, however, 53.9% of those who held fellowships in the second decade are listed in the Medical Sciences Information Exchange as compared with 36.2% of the fellows in the first decade This difference is significant at the 0.01 level of confidence

Indexes of Efficiency—In accordance with the procedure described previously, indexes of efficiency were computed for the total group, the preclinical group, and the five fields analyzed The results appear in table 6 The indexes for the total group show considerable variation from one criterion to another Apparently the method operated with an efficiency of 61.6% if listing in "American Men of Science" is used as the criterion of success It was somewhat less effective in selection and development of men who would resist the temptation to enter full-time practice With respect to full-time academic work, its efficiency was only 18.1% The efficiency indexes for the preclinical group follow the same pattern, with one exception When the criterion of number of professors is used, a somewhat lower efficiency is indicated in the preclinical area as compared with the total group In the analysis of individual fields, indexes of efficiency in general are higher for the clinical fields of medicine and surgery than for biochemistry and physiology in the preclinical area More specifically, somewhat higher indexes are found for surgery than for medicine The widest deviation occurs in the analysis

of academic positions, with an index of 15% in medicine and 60% in surgery Pathology tends to follow the pattern of the clinical fields, with relatively high indexes of efficiency for all criteria

IMPLICATIONS OF RESULTS

Conclusions must be drawn with caution on the basis of a survey of this nature While the sample is large and the criteria employed are objective, it is clear that additional study is needed Moreover, development of more discriminating criteria of "success" in the fields of scientific research and academic work is a major prerequisite for such investigation In the meantime, certain trends and implications emerge from the data at hand It appears, for example, that the persons who received fellowships during the first 20 years of this program were, as a group, more "successful" than those who were rejected during that period with respect to the criteria selected To the extent that these indexes reflect the purpose of the fellowships, there are indications that the program has been effective in selecting personnel with potentialities for leadership in medical investigation and teaching and in affording opportunity for development along these lines The implications are the same and are equally clear-cut when the past fellows and rejected candidates working in the clinical area are compared The pattern for the specific fields of medicine and surgery is sufficiently similar to that for the clinical group as a whole to reinforce the inference that the program in this area has, in some degree at least, achieved its goal

This conclusion is not wholly justified for the preclinical field on the basis of the evidence at hand There are true differences for the entire preclinical group on four of the six pertinent criteria, and the indexes of efficiency follow the pattern for the total group for all except one of the criteria No highly significant differences were found, however, between fellows and rejected applicants working in physiology and biochemistry, and there are indications that the program operated with less effectiveness in

TABLE 6—Indexes of Efficiency

Criterion	Total Group %	Pre-clinical %	Medicine %	Surgery %	Biochemistry %	Pathology %	Physiology %
Listing in American Men of Science	61.6	63.6	59.0	58.0	44.8	79.6	60.7

Professorships	27.9	16.9	46.0	77.3	21.4	51.1	29.8
Senior academic positions	21.1	21.7	23.3	60.0	19.5	37.9	18.0
In practice	44.2	37.3	37.3	36.9	48.7	100.0	0.0
Without concurrent university appointment	58.6		72.4	40.6	10.7	100.0	0.0

these two fields than in the specific clinical fields analyzed The contrast is even sharper when the group holding only the M.D. degree is compared with that holding only the doctorate in the preclinical sciences These facts would not, on the other hand, justify the inference that the selection program has been unsuccessful in the preclinical sector The percentages of past fellows exceed those of rejected candidates for all of the six pertinent criteria, not only for the preclinical area as a whole but for the individual fields analyzed The trend is clear, even

though the differences are not consistently large enough to be statistically significant. Moreover, the total pre-clinical group (including all applicants) surpasses the combined group in the clinical field on five of the six criteria.

Some conjectures may be advanced concerning the reasons for these differences between the clinical and pre-clinical groups. Men with clinical training have ample opportunity to leave the academic field, either to enter private practice or to accept positions in hospitals or other organizations. For the most part, financial rewards are substantially greater if they choose the latter course. This is not true of the preclinical group, a majority of whom do not hold the M.D. degree. While there is opportunity in government and industry, the number of such positions is limited in comparison with the academic appointments available to these men. It may be that in the past industrial and governmental positions have not held as much appeal for this group as have academic careers. In any case, applicants in the preclinical fields appear to have remained in research and academic work to a greater extent than those in the clinical fields. These considerations further emphasize the fact that the criteria selected are not adequate indexes of "success" in the preclinical field. Conclusive evidence as to whether differences exist between past fellows and rejected applicants in such fields as physiology and biochemistry can be obtained only when more effective criteria have been established.

It will be recalled that rejected applicants who had held other fellowships differed from those who had not with respect to only one criterion, while significant differences were found for all criteria when past fellows were compared with rejected candidates who had held other fellowships. Assuming that the questionnaire data regarding other awards are accurate, they were comparable to National Research Council fellowships in that they were on the postdoctoral level and offered opportunity for full-time research experience. A major portion of these other fellowships were, however, supported by local universities or hospitals and cannot be considered comparable in this sense. The data indicate, then, that the results of this program compare favorably with those of the other agencies that supported the fellowship awards made to the 274 rejected candidates. No conclusion is warranted as to the relative outcomes of this and other national programs.

The evidence, for the most part, supports the view that the comparative status of the two categories with respect to the various criteria is not related to age. The pattern of results was unchanged when the groups were equalized as to age. The difference in the percentage of fellows listed in the Medical Sciences Information Exchange in the first and second decades suggests the possibility that, for fellows, an inverse relationship may exist between age and the likelihood of holding a research grant. It is equally possible that this difference may be a function of selection ratio.

Three possible reasons may be advanced for the differences found in favor of the past fellows. 1. The selection process has been effective. 2. The opportunity provided by the fellowship has been valuable. 3. The

prestige of holding a National Research Fellowship was a contributing factor. It is impossible to separate the effects of these factors, but certain rough indications of their relative importance may be noted. It probably is correct to assume that the control group who held other fellowships had an opportunity for research experience somewhat comparable to that offered the Council's fellows. The fact that they differed on all criteria from past fellows and only on one criterion from other rejected applicants might be construed as an indication that the fellowship experience is not wholly responsible for the obtained differences and that effective methods of selection and/or the prestige of the Council's program have played a part. Since details are lacking concerning the administration and nature of the opportunity offered by the other programs, this is advanced merely as a conjecture.

A second control group is available, consisting of the 26 persons who were offered fellowships but did not accept the awards. No significant differences were obtained when this group was compared with past fellows or with rejected applicants, however, when the obtained frequencies and percentages for these persons are compared with the data in table 1, the percentages for this small group fall between those for past fellows and rejected applicants in each criterion category. No conclusions can be drawn in the absence of statistical evidence. Nevertheless, if this trend were corroborated by future research when a larger control group is available, it would indicate that both the value of the fellowship experience (possibly in combination with its prestige) and the effectiveness of the selection techniques are associated with the observed differences between the two major groups.

2101 Constitution Ave., N.W.

Drug Addiction.—The many investigations of the past two years indicate an upward trend in drug addiction, predominantly among the younger members of urban populations.

Informed sources now are of the opinion that the crest of the wave has passed and that increased facilities for vigorous law enforcement are bringing about a downward trend. No one can say with definiteness how many addicts there are today in the United States (one conservative estimate is 1 in 3,000 of our population), but whatever the figure, an established addiction is like a contagious disease and the more our attitude toward and handling of addiction approximates our attitude toward and handling of recognized contagious diseases the better will be our understanding and control of addiction. Physicians can do much to foster this attitude and handling by keeping themselves thoroughly informed of the characteristics and recognition of addictions, including addiction to the barbiturates and to the new potent analgesics, all of which unfortunately have shown addiction liability and some of which already have appeared in illegitimate narcotic traffic. Physicians can help, too, by an informed attitude toward the handling of an addict and by their constant urging of local facilities for the treatment of addiction. Physicians cannot supply drugs to addicts simply to maintain their addiction and the advocated establishment of government clinics for the purpose has been tried and failed. Adequate quarantine and institutional treatment is the best line of attack and this means not only treatment during the acute phase of withdrawal but, even more importantly, prolonged rehabilitative treatment directed toward adjustment of the individual to his environment so that he does not have to seek escape again with drugs.—N. B. Eddy, M.D., Foreward, Symposium on Drug Addiction, *The American Journal of Medicine*, May, 1953.

CLINICAL NOTES

DANGER OF FISH LENS PROTEIN INJECTION AS TREATMENT FOR CATARACT

Goodwin M. Breinin, M.D., New York

The currently much-publicized use of fish lens protein injections as a treatment for cataract¹ has aroused great interest in the lay public and the medical profession both here and abroad. Lens protein from various sources, administered orally or by injection, has been used by numerous investigators in the therapy of cataract, but the arrest or cure of cataracts so treated has never been proved.²

The antigenic properties of lens protein are well known, and the occurrence of the clinical entity endophthalmitis phacoanaphylactica, described by Verhoeff and Lemoine in 1922,³ although debated for many years, has now achieved wide acceptance.⁴ Kirby^{5b} has cited the danger of sensitization to lens protein inherent in such methods of treatment, and recently Posner⁵ reported the case of a patient in whom uveitis developed after receiving a four months' course of fish lens protein injections for cataract. This subsided after an intracapsular cataract extraction. He warned that in patients known to have received such therapy every effort must be made to do an intracapsular extraction.

The following case reports are important because they are additional examples of the development of uveitis in the course of fish lens protein injections. In the first and second patients uveitis developed bilaterally, and in the first bilateral secondary glaucoma developed. The first case also points up the good result obtained by intracapsular cataract extractions plus corticotropin and cortisone therapy. Furthermore, in the first case hypersensitivity of the patient to her own lens protein was shown by skin tests. In the third patient, uveitis immediately followed an extracapsular extraction.

REPORT OF CASES

CASE 1—A 55-year-old white woman became aware of failing vision in June, 1952, and was told by an ophthalmologist that she had cataracts, the one in the left eye being more advanced. In July, 1952, she began a course of fish lens

protein injections, which were given three times a week for about four and one half months, after which this treatment was temporarily stopped. Several weeks later, her left eye became inflamed and painful. The physician who had given her the injections referred her to an ophthalmologist, who told her she had uveitis and glaucoma. He prescribed cortisone drops, which the patient used for about one month. Several weeks before she came to my office, her right eye also became inflamed. Vision rapidly decreased, until, two days before her visit, she realized it was almost gone. Results of an examination made Feb. 28, 1953, were as follows:

Vision

Right eye—counts fingers at one foot

Left eye—light perception

Right Eye

Conjunctiva—hyperemia and ciliary injection

Cornea—epithelial edema folds in the lamina elastica posterior (Descemet's membrane) many gray keratic precipitates and pigment particles

Anterior chamber—deep minimal aqueous flare a few floating cells

Pupil—small but dilated to 4 mm, much iris pigment on the lens capsule

Lens—nuclear and cortical cataract moderately advanced

Fundus—not seen

Left Eye

Conjunctiva—slight injection

Cornea—clear

Anterior chamber—deep a few cells flare minimal

Pupil—small no synechiae

Lens—mature cataract, solid white appearance

Fundus—not seen

Visual Fields

Full to light and hand movements

Ocular Tension

Right eye—38 mm Hg Schiøtz

Left eye—48 mm Hg Schiøtz

After moderate pupillary dilatation with 10% phenylephrine hydrochloride and epinephrine hydrochloride in 1:1,000 dilution, the ocular tension remained the same. With 2% pilocarpine hydrochloride, however, the tension of the left eye was reduced to 34 mm Hg. The hourly use of 2½% cortisone acetate drops was prescribed. After two days the tension was 34/34 mm Hg, and the patient was hospitalized March 4, 1953. Tension in the left eye remained well controlled, but in the right eye fluctuated widely. On March 6, a combined intracapsular extraction was done on the left eye. Three 6-0 chromic absorbable surgical corneoscleral sutures were placed. On the evening before the operation, 75 mg of corticotropin had been given intramuscularly. Cortisone ointment was instilled postoperatively at the time of daily wound dressing. On the fourth postoperative day, the tension in the right eye was 55 mm, and it did not respond to the use of miotics or mydriatics. Therefore, a combined intracapsular extraction was performed on the right eye. Corticotropin was given intramuscularly daily for a week, and cortisone ointment was instilled when dressings were changed. Despite the hypertension and uveitis, the operative procedures and the postoperative course were completely uneventful. The tension was immediately normalized, and the eyes became white within two weeks. The patient was discharged March 22, 1953. Final corrected vision in each eye is 20/20.

CASE 2—A 44-year-old white man has severe myopia and complicated cataracts, consisting chiefly of posterior cortical rosettes, in each eye. In May, 1952, visual acuity was 20/50 in each eye. The patient was next seen on Feb. 5, 1953, when he complained of pain in the left eye and photophobia in the right. A positive aqueous flare and cells were present in both eyes. Vision was 20/70 in each eye. The anterior chambers were deep. The use of cortisone drops and ointment was prescribed. On March 6, 1953, the flare and cells were still present in the left eye and, to a lesser extent, in the right eye. When last seen, April 2, 1953, the patient's visual acuity was 20/100 in each eye and the cataracts had increased in size and density. At this point the patient admitted that since October, 1952, he had received about 40 injections of fish lens protein. After the 30th injection, pain and photophobia developed in the left eye. The patient attributed this to dental complications, and, after a brief lapse, received 10 more injections. Vision had then definitely decreased, prompting his visit of February, 1953, described above.

CASE 3—A 59 year-old white man was first seen Sept 26, 1952. He had a cataract in the right eye, consisting of moderately advanced, posterior subcapsular and cortical opacities, with vision of 20/200. The left eye showed early cortical changes, with vision of 20/30. A week previously, the patient had begun taking fish lens injections. He received 34 injections over a three month period. On Nov 28, 1952, the cataract in the right eye showed complete maturity. The left lens showed progressing cortical opacities. The rapidity of maturation of cataract in the right eye was striking. In January, 1953, an extracapsular extraction was performed on the right eye. The eye remained congested, and numerous mutton fat keratic precipitates appeared. With foreign protein injections and topical administration of cortisone the uveitis has diminished. A secondary membrane is present, and corrected vision is 20/30.

COMMENT

Shropshire,⁶ in 1937, in a completely undocumented article, propounded the value of fish lens protein in the treatment of cataract. He quoted Hektoen (no source cited) as stating, "an animal sensitized with mammalian lens protein gave a positive precipitin reaction with the extracts of lenticular protein of all the living organisms tested except fish. In animals sensitized with extracts of fish lens protein a markedly positive reaction was obtained with the lenticular protein of all the species of fish tested but with no other available type of lenticular protein." This is incorrect, for Hektoen and Schulhof,⁷ in 1924, apparently the source cited, actually made the following statement: "Injecting rabbits with solutions of Menhaden lens induces the formation of precipitins for the lens of this and other salt water fish. At the same time but not nearly in the same concentration, precipitins for beef, human, rabbit and swine lens are called forth. Serum against beef, human or swine lens also contains small amounts of precipitin for Menhaden lens. While the fish lens contains antigenic elements of the same kind as the mammalian lens, it also contains antigenic elements that are different and specific for fish. As the serum against Menhaden reacts with beef and swine crystallins and anticycrallin serum may react with Menhaden lens, it seems that these crystallins constitute at least a part of the element common to both fish and mammalian lens." Hence, fish lens may not only elicit antibodies for human lens but also may induce sensitivity to fish itself, a notoriously allergenic material. In addition, according to Burky,⁸ should bacterial contamination of the lens protein occur or should a focus of infection exist in the body, a great increase in antibody formation would be expected.

Human hypersensitivity to lens protein has been adequately shown to occur.⁹ Tissue specificity, rather than species specificity, a characteristic of all lenses studied, is based on common protein constituents. Thus, it is to be expected that man may be sensitized by fish lens injections to all lens protein, including that of his own lens.

The uveitis and secondary glaucoma that appeared during fish lens injections in the patient in case 1 could not be adequately controlled by medical measures. Since it seemed probable that an induced antigen-antibody reaction was occurring through the intact capsule of the patient's lens, removal of the source of antigen, the lens, appeared necessary, despite the unpleasant complications. The use of corticotropin and cortisone to allay the inflammation appeared to be a wise measure. It also constituted a precaution against severe phacoanaphylaxis

should extracapsular extraction have occurred inadvertently. There was no delay in healing. The visual result is excellent (20/20 in each eye), the eyes are quiet, there is no trace of inflammation, and the tension is normal. To test the sensitivity hypothesis, the patient's own lens was employed as an antigen, since commercial preparations of lens protein are not available. The lens was expressed from its capsule and triturated in 2 cc of isotonic sodium chloride solution with 2 drops of dilute thimerosal (Merthiolate) added. The resulting solution was tested for sterility. Prior to the second cataract extraction, an intradermal injection of 0.05 cc of the antigen solution produced a pronounced erythema and wheal, appearing within 20 minutes and lasting about two hours. A control injection of 0.05 cc of the sodium chloride solution and thimerosal diluent produced a slight wheal without erythema. Repetition of the test three weeks later gave similar results. The antigen and control solutions were similarly administered to 11 patients with various ophthalmic conditions (7 with cataract, 2 with glaucoma, 1 with retinal detachment, 1 with enucleation, and 1 who had had a plastic operation on the lid). None showed more than slight whealing with both the antigen and control solutions.

The occurrence of uveitis during fish lens injections in the patient in case 2 makes it the third such case known to me. The sequence of events is characteristic. Many more instances will doubtless come to light. The reluctance of the patient to tell all the facts points up the importance of obtaining a reliable history, for on this, as Posner has noted, may depend the patient's visual outcome. The value of skin testing for lens protein sensitivity is now evident. Lens antigens may be readily prepared from human or animal sources according to the method described above or by the method of Verhoeff and Lemoine.³

Case 3 is an illustration of the typical phacoanaphylactic uveitis produced by the liberation of lens protein in the eye of a patient sensitized by the fish lens injections. The outcome in this case must be considered fortunate. Severer reactions may be anticipated in other patients, perhaps with loss of the eye. So far as these cases show, fish lens protein was of no therapeutic value, the cataracts matured rapidly. Moreover, definite harm was done.

SUMMARY AND CONCLUSIONS

Promiscuous use of fish lens protein in the therapy of cataract is a dangerous procedure that may induce a state of hypersensitivity. This may be manifested in the development of uveitis due to an antigen-antibody reaction with the patient's own lens, and secondary glaucoma may also occur. Rapid maturation of cataracts has occurred during fish lens protein treatment. These complications necessitate cataract extraction, despite the additional hazards. Corticotropin and cortisone are valuable adjuncts in the management of such complicated cataracts. Patients subjected to fish lens therapy

are potential victims of endophthalmitis phacoanaphylactica. The importance of intracapsular cataract extraction in such patients should be widely publicized, since many will undoubtedly come to surgery. Skin testing for sensitivity to lens protein provides valuable diagnostic information.

RENAL VEIN THROMBOSIS IN INFANTS

Hugh Warren, M D

McLemore Birdsong, M D

and

Robert A Kelley, M D, Charlottesville, Va

In clinical practice, thrombosis of the renal vein is rare, but, when encountered, it requires prompt urologic evaluation. The diagnosis has been established most frequently at operation or autopsy, and it was not until 1942 that the first preoperative diagnosis of renal vein thrombosis was confirmed at operation by Campbell.¹ With the modern facilities now available to the urologist, the correct diagnosis should be easier to make. Two instances of thrombosis of the renal veins are presented here to re-emphasize the importance of a correct preoperative diagnosis.

Thrombosis of the renal vein occurring in infancy is usually of the primary type, the thrombotic process arises in the renal vein or in its intrarenal tributaries. In 1945, Abeshouse² reviewed 228 cases of renal vein thrombosis and found that 98 of those cases were in children less than one year old and, that, of this total, 90 occurred in infants during the first two months of life. A secondary type, resulting from a direct extension of a thrombosis in the vena cava or extrarenal branches of the renal vein, occurs more frequently in adults. Since this communication reports two cases of renal vein thrombosis in infants, our discussion will be limited to the primary type.

The literature is replete with factors that may cause primary thrombosis of the renal vein. Among the main predisposing causes suggested are ileocolitis and associated dehydration, sepsis, omphalitis, and focal infection. The relationship of these factors to the cases being presented will be discussed later. The signs and symptoms of renal vein thrombosis are usually flank pain, a palpable abdominal mass, hematuria, albuminuria, pyuria, anorexia, leukocytosis, and fever. Although not present in our cases, cylinduria is said to occur, as well as diarrhea, constipation, overwhelming sepsis, oliguria, or even anuria. A diagnosis of renal tumor or hydronephrosis is compatible with the above-mentioned symptom complex, and this, in the past, has probably led to many incorrect diagnoses. The possibility of renal vein thrombosis should be given full consideration in any distressed infant who has a palpable abdominal mass and hematuria. With the

use of intravenous urography and retrograde pyelography, sufficient data in most cases can be obtained to establish a correct diagnosis.

If clinical evaluation indicates a unilateral thrombosis of the renal vein surgical intervention is mandatory. The preoperative care consists of general supportive measures, such as blood transfusions, correction of electrolyte imbalances, and the use of antibiotics if indicated. When the prothrombin time is abnormally low, the use of vitamin K is helpful. The treatment of choice is nephrectomy through a lumbar approach. The suggested use of anticoagulant therapy has its disadvantages if an operative procedure is contemplated, but, when the clinical findings indicate a bilateral renal vein thrombosis, anticoagulant therapy becomes of prime importance.

REPORT OF CASES

CASE 1—A male infant was born on Sept 10, 1948. The baby was full term and was delivered from a left occiput transverse position with low forceps. The mother was 30 years old, and this was her first pregnancy. There were no complications of pregnancy or delivery, although the mother had arrested tuberculosis. The first stage of labor lasted six and one half hours, the second stage lasted 58 minutes. At birth the child weighed 7 lb 11 oz. (3,487 gm), and the physical examination revealed no abnormalities. The postnatal course was satisfactory until Sept 19, 1948, the ninth day of life, when projectile vomiting occurred. The next morning the baby again vomited. On physical examination at that time the baby was uncomfortable and in some distress. The abdomen was tender and moderately distended. On careful palpation, a mass that measured approximately 9 by 4 cm could be felt in the left flank in the general area of the left kidney. A specimen of urine was obtained that, on examination, revealed innumerable red blood cells, 4+ albumin, but no casts or white blood cells. Urine studies repeated over the next four days showed a decrease in albumin and in red blood cells, but a definite pyuria had developed. With 20 to 30 white blood cells per high power field. Blood studies on Sept 20, 1948, showed a hemoglobin level of 101% (15.5 gm, Haden), red blood cells, 4,660,000, white blood cells, 17,400, and blood urea 52 mg. per 100 cc. Clotting and bleeding times were normal. Two days after the onset of symptoms, intravenous urograms were obtained, but there was no visualization of the dye in either the right or the left kidney. Three days later, more urograms were made, and no dye was seen to come from the left kidney, although some secretion was evident from the right kidney. Unfortunately, retrograde pyelograms were not obtained.

On Sept 27, 1948, one week after the onset of symptoms, surgical exploration was undertaken with a preoperative diagnosis of Wilm's tumor. For this reason a transperitoneal approach was chosen. With the patient under general anesthesia, a left rectus incision was made from the costal margin to below the umbilicus. The surfaces of the peritoneum were found to be smooth with no excess fluid present. The small intestines were delivered onto a warm laparotomy pad, and the transverse and descending colon were exposed. Through the posterior peritoneum, a rather large mass was evident. To gain added exposure a "T" extension of the rectus incision was made laterally. The descending colon was then reflected mesially, and the posterior peritoneum was incised and dissected from the renal mass. No perirenal hemorrhage was noted. The renal mass was dark red and strongly suggestive of tumor tissue. The pedicle was then doubly clamped and transected and the kidney removed. Chromic surgical sutures were employed to secure the pedicle. The small intestines were replaced and the incision closed in layers with continuous absorbable sutures. During the operation, the patient received a blood transfusion. He was returned to the ward in good condition.

The pathology report described a kidney measuring 6 by 4 by 4 cm. The fecal lobulations were prominent. The mass of kidney tissue was soft and deep red. On section, the pelvis was found to be filled with old blood. The renal vein contained a large, firm blood clot. The kidney tissue was hemorrhagic.

From the departments of urology and pediatrics, University of Virginia Hospital.

Drs. T. J. Humphries and G. G. Gooch III gave permission for the report of case 2.

1. Campbell M. F. and Matthews W. F. *Renal Thrombosis in Infants: Report of Two Cases in Male Infants Urologically Examined and Cured by Nephrectomy at 13 and 33 Days of Age*. *J. Pediat.* 20: 604, 1942.

2. Abeshouse B. S. *Thrombosis and Thrombophlebitis of the Renal Veins*. *Urol. & Cutan. Rev.* 49: 661, 1945.

throughout, and no normal renal tissue was evident. Microscopic examination showed, in all portions, considerable destruction of renal tissue and marked engorgement with blood. In only a few regions of the cortex could any normal renal tissue be found. Inflammatory infiltration was evident in the form of polymorphonuclear leukocytes, lymphocytes, and plasma cells. Based on these findings, the diagnosis was extensive thrombosis of renal vein and hemorrhagic infarction of the kidney.

The postoperative course was uncomplicated, and the child was discharged on the 38th day in good condition and above his birth weight. After his discharge from the hospital, the patient did well and was examined at monthly intervals. On April 26, 1950, where the patient was 19 months old, acute intestinal obstruction developed. Two days later, he was brought to the hospital in a moribund state and died eight hours later. Autopsy showed extensive fibrous adhesions around the old operative site in which the small intestines were involved with mechanical obstruction to the ileum.

CASE 2—This patient was a white male infant born on Sept 15, 1951. The child's mother was a nurse, and her pregnancy was considered normal. At the time of labor, the mother's membranes were ruptured surgically. Three and one half hours after rupture of the membranes, the infant was delivered with outlet forceps while the mother was under saddle block anesthesia. The baby voided in the delivery room, but no notation was made of the character of the urine. Physical examination carried out approximately 12 hours after birth revealed an apparently normal, although slightly premature male infant. There was a small bruise on his right ear and cheek from the application of forceps. His birth weight was 5 lb 9 oz. (2,524 gm). A notation was made in the nurse's notes approximately 24 hours after delivery stating that the diaper was stained red. Forty-eight hours after delivery, the same observation was made twice by the nurse, and examination of a voided urine specimen revealed innumerable red blood cells. Four days after delivery, the baby was circumcised, and, at that time, a palpable mass was noted in the right flank. The baby appeared to be toxic, he ate poorly, and progressive weight loss was noted. Eight days after delivery, oxytetracycline (Terramycin) medication was started, but no change was noted in the urinary findings. Ten days after delivery, intravenous urograms were obtained that revealed a good concentration of the dye in the left kidney, which was considered to be normal. There was no evidence of any excretion of the dye in the right kidney. There was a large, soft tissue shadow occupying a great portion of the right side of the abdomen. The radiological impression was that the left kidney was normal and that the right kidney was nonfunctioning.

On Oct 1, 1951, 16 days after the baby's delivery, lumbar exploration of the right kidney was carried out. The preoperative diagnosis was probable Wilms' tumor. At operation, an infarcted kidney was found and a right nephrectomy carried out. The pathological report described a hemisected kidney measuring 2.5 by 3.5 by 1 cm. The pelvis was normal in appearance. The kidney tissue was soft, necrotic, and hemorrhagic. Microscopic examination showed extensive necrosis involving all areas. Some glomerular structures were preserved, as well as some tubular structures. The medium sized and small vessels showed necrosis, and there were many recent small thrombi. A diagnosis of extensive necrosis of kidney with many vessels thrombosed was made.

Postoperatively the urine was normal in appearance, and the baby gained weight steadily. Approximately eight months after the patient was discharged from the hospital, his local physician was contacted. The physician reported that the child was progressing normally. The only significant finding on repeated urine analysis was an occasional trace of albumin.

COMMENTS

In a consideration of the etiology of this condition, the high incidence of its occurrence in infants less than 2 months of age is striking. It usually occurs shortly after delivery, as exemplified by the two cases reported here.

It seems reasonable to assume that the thrombotic process is gradual rather than instantaneous. It is conceivable then that the occlusion of the renal vein manifested by signs and symptoms at the age of 2 months could have been initiated earlier. In case 2 there is strong evidence to indicate that it could have been initiated in utero, in support of this contention is the observation of gross hematuria within the first 24 hours of life and an abdominal mass palpable on the fourth day. Furthermore, study of the histological sections in both of these cases indicates that the degenerative changes in case 2 are of greater duration than those in case 1.

It is notable that none of the common causative factors described in the literature were present in these two cases. This would indicate to us that there are some causative factors as yet undescribed. The trauma of birth must be considered, but opposed to this possibility is the absence of thrombosis of the renal vein following deliberate, temporary occlusion during renal operations. This is much greater than any trauma that might conceivably occur during birth. In reviewing our cases, it is equally difficult to accept the role of hemoconcentration, associated with dehydration, as causing the selective thrombosis of a large and active renal vein. For the same reason, any systemic condition such as sepsis would seem to be equally unlikely. A more plausible explanation for this localized venous thrombosis is some local predisposing factor in the renal vein. Such a factor, aside from trauma, would seem to require some intrinsic congenital vascular anomaly, an obstructive lesion could account for a progressive thrombosis that becomes evident clinically only when the occlusion has become complete. Unfortunately, the search for such an anomaly is made doubly difficult by the thrombosis per se and the small segment of renal vein available for study after nephrectomy. In future cases devoid of trauma and constitutional disease, a thorough study of venous circulation of the kidney is indicated.

From our experience in these two cases, the choice of surgical approach should be emphasized. The lumbar or retroperitoneal approach precludes development of postoperative peritoneal adhesions and subsequent complications as demonstrated in case 1. Transperitoneal exposure of the kidney in the very young is unnecessary and unwise.

SUMMARY

Two cases of renal vein thrombosis in infants are reported. Full consideration of the signs and symptoms together with the urographic findings is of invaluable aid in ruling out renal tumors and recognizing this condition preoperatively. That renal vein thrombosis usually occurs in infants within the first two months of life is again emphasized. The possibility that thrombosis occurred in utero in case 2 is suggested. In these two patients, the absence of any of the accepted predisposing conditions gives rise to speculation about some additional causative factor. The possibility of a congenital vascular anomaly of the renal vein leading to occlusion is advanced. The lumbar surgical approach is advocated in preference to a transperitoneal approach.

STAPHYLOCOCCIC ENDOCARDITIS TREATED WITH NEOMYCIN

REPORT OF A CASE

Charles E. Reed, M D

and

Eugene A. Wellman, B S, Corvallis, Ore

The problem of staphylococcic endocarditis has recently been reviewed by Dowling and his associates¹, the reader is referred to his review for a complete bibliography. The following case illustrates the value of bacteriological control in therapy. To our knowledge this is the first report of successful use of neomycin in staphylococcic endocarditis, although Kenoyer² reported its use in endocarditis resulting from *Pseudomonas*.

REPORT OF A CASE

A 24-year-old white housewife was admitted to the Good Samaritan hospital in April, 1952, in a semicomatose state. She had been in good health during an uneventful pregnancy until two weeks prior to admission, when cough and fever developed. She was hospitalized elsewhere and was given penicillin and streptomycin. Because the cough, fever, and dyspnea rapidly became worse, she was given successively aureomycin, chloramphenicol (Chloromycetin), oxytetracycline (Terramycin), and *p*-aminosalicylic acid without improvement. One week after the onset of her illness, she delivered a stillborn infant of eight months gestation. Her course continued downhill and, three days before admission to Good Samaritan Hospital, she was given digitoxin and cortisone. The day before admission she had pleuritic chest pain and hemoptysis for the first time. Her history was unremarkable except for a spontaneous abortion one year before the present illness. There was no known heart disease or rheumatic fever, and there was no history of rheumatic fever in the family.

Physical examination showed an acutely and critically ill young woman who was semicomatose. Her temperature was 101.2 F rectally. There was no cyanosis, but the skin was *cafe-au-lait* colored. The respirations were grunting, and the rate was 32 per minute. Coarse and crepitant rales were present throughout both lungs. The heart was enlarged to the left to the anterior axillary line in the fifth interspace. There was a forceful thrust over the right ventricle. P-2 was accentuated and M-1 was muffled. Loud systolic and diastolic murmurs were heard at both apex and base. There was a sinus tachycardia of 120, blood pressure was 100/60 mm Hg. The remainder of the examination was normal except that the Babinski sign could be elicited on the right. No petechiae were seen, the liver and spleen were not felt, and the fingers were not clubbed.

The hemoglobin level was 10.1 gm per 100 cc, red blood cell count per cubic millimeter was 3,150,000, and white blood cell count 14,200, with 85% polymorphonuclear leukocytes, 1% eosinophils, 13% lymphocytes, and 1% monocytes. The

sedimentation rate was 45 mm in one hour (Westergren). Urinalysis was normal, and the initial blood culture was sterile. A roentgenogram of the chest confirmed the presence of cardiac enlargement and showed a bizarre pulmonary infiltration with mottled density throughout the left lung field and the lower half of the right lung field. An electrocardiogram showed digitalis effect and inverted T waves in V-1, V-2, and V-3 suggesting acute right ventricular strain.

The patient was given oxygen, maintained on digitalis and given anticoagulants, but the dyspnea and rales became worse, and the anemia increased. Rectal temperatures ranged from 98 to 101 F. On the fourth hospital day, administration of cortisone was resumed, and transfusions were given, she then improved slowly. The patient's chest cleared both to physical and roentgenographic examination, and the sedimentation rate returned to normal, but the low grade fever and leukocytosis continued.

On the presumptive diagnosis of bacterial endocarditis, the patient was given 2 million units of penicillin and 1.5 gm of streptomycin daily without any change in her course. Meanwhile, three successive blood cultures and a bone marrow culture had been taken, and three more blood cultures were taken during the penicillin and streptomycin therapy. All of these cultures were positive, yielding a nonpigmented *Micrococcus*. The organism produced acid from glucose, maltose, sucrose, and lactose but not from mannitol. Hydrogen sulfide was not formed, gelatin was liquefied slowly, and ammonia was produced from peptone. There was no hemolysis on blood agar and no coagulase production. From these and other characters, a tentative identification of *Micrococcus epidermis*³ (*Staphylococcus epidermis*) was made.

Sensitivity tests by means of disk technique (Difco Discs) demonstrated that the organism was resistant to the following antibiotics: penicillin, streptomycin, aureomycin, chloramphenicol, bacitracin, and oxytetracycline and, also, that its growth was simulated by these antibiotics. The sulfonamides were likewise incapable of inhibiting growth. Tests by means of the tube dilution technique,⁴ with penicillin, disclosed maximum growth at a concentration of 50 units of penicillin per milliliter of solution. It was also found that no synergism existed between penicillin and streptomycin. Polymyxin was ineffective. Neomycin sulfate assayed by this method demonstrated an inhibitory effect at a concentration of 0.1 to 0.2 µg per milliliter.

On the 26th hospital day, therapy with 0.25 gm of neomycin sulfate administered intramuscularly every six hours was started. One week later, the amount of neomycin sulfate was reduced to 125 mg every four hours. Blood levels were 0.8 to 1.2 µg per milliliter, well above the bacteriostatic level. There was prompt clinical response. The patient's temperature returned to normal in 24 hours, and she was subsequently afebrile. Therapy with cortisone was discontinued before the administration of neomycin was started, and her sedimentation rate remained normal. There was no flare up of the pneumonia. Urinalyses performed each day during therapy with neomycin consistently showed a trace of albumin and a few hyaline casts after the first week, but there was no evidence of progressive kidney impairment. The blood urea nitrogen was never elevated. Administration of the neomycin was continued for five weeks, until the patient complained about buzzing in the ears and slight decrease of auditory acuity. Her auditory acuity has remained impaired, but vestibular signs have not developed. She has remained well for one year and has resumed her former activity. There is no cardiac failure, but the left ventricle is enlarged laterally and posteriorly. Auscultation of the heart reveals a harsh systolic and a soft blowing diastolic murmur at the base. No murmurs are heard at the apex. Many blood cultures taken over the four months following hospitalization were sterile. The patient is no longer anemic and her urine is normal except for a trace of albumin. The electrocardiogram indicates that the heart is in a vertical position and that there is left ventricular hypertrophy.

COMMENT

Although renal and eighth nerve damage are known to occur after parenteral administration of neomycin, there have been no reports of toxicity in cases in which the dose was limited to 1 gm a day for a period of 7 to 10 days.⁵ We elected to continue use of the antibiotic as long as possible because of the possibility of a bacteriological relapse on premature discontinuance of therapy and the possibility that the organism might then be resistant to neomycin as well as the other antibiotics. The occurrence of buzzing in the ears and slight decrease in hearing after five weeks of therapy was considered the indication to discontinue therapy with the drug.

SUMMARY

The case of a 24-year-old pregnant woman with endocarditis complicating active rheumatic carditis and rheumatic pneumonia is reported. The causative organism was resistant *in vitro* to all available antibiotics except neomycin. The patient recovered after prolonged administration of neomycin.

GLOSSOPHARYNGEAL NEURALGIA WITH SYNCOPE AND CONVULSIONS

P L Richburg, M D

and

C E Kern, M D, McKinney, Texas

It is our deep conviction that a report of one case, no matter how interesting to an isolated group, should not be undertaken lightly. It is our opinion, however, that a rare syndrome that combines complete disability, unbearable pain, and convulsions, and that is cured by a simple neurosurgical procedure constitutes a situation in which the report of an isolated case is justifiable. The syndrome we would present is readily diagnosed by the symptoms and is completely cured by the intracranial section of the glossopharyngeal nerve. The symptoms are pain in the region of one ear and one side of the throat, occurring at brief intervals, of short duration, and accompanied by bradycardia, at times resulting in attacks of syncope and convulsions.

Glossopharyngeal neuralgia has been a recognized entity for 30 years, and it is similar to tic douloureux except for the location of the pain and the trigger zone. It occurs about 1/40th as often as trigeminal neuralgia and is sufficiently rare that many experienced neurosurgeons have never seen a case. As pointed out by Pastore and Meredith in 1949¹ when they reported eight cases, this neuralgia is completely cured by intracranial section of the ninth nerve. The association of the neuralgia with the carotid sinus syndrome or cardiac arrest and convulsions is apparently a very rare condition but has been recognized for the last 10 years. Riley and associates² in 1942 reported such a case and suggested that during these attacks of pain excessive stimuli to the carotid sinus reflex pathway was the cause of the syncope and cardiac arrest. In 1948 Ray and Stewart³ reported

a similar case, which was cured by ninth nerve section. They suggested that atropine might have abolished the cardiac response and therefore the syncope, however, they did not test this presumption because the patient was in intense pain and demanded immediate relief.

We wish to present in some detail another example of this syndrome, in which we were able to dissociate the cardiac response from the pain by the use of atropine, suggesting that temporary control of convulsions and cerebral manifestations may be achieved until complete cure by surgery can be effected.

REPORT OF A CASE

A 36-year old north Texas farmer first came to the hospital July 2, 1950. He was in a deplorable condition, and the principal complaint was pain. The pain was an intense, lancinating, burning, shock-like sensation occurring at brief intervals and lasting only a short while, starting deep within the left ear, and spreading to the deep structures of the upper portion of the throat on the left side. The attacks of pain were almost always brought on when the patient swallowed, particularly if he swallowed cold liquids, and they were frequently induced by simply clearing the throat or by talking. On at least 12 occasions the pain had been accompanied by sudden loss of consciousness, so sudden that he would fall. He had been told that during these short periods of unconsciousness that there were jerking movements of the extremities, the eyes would roll, and he apparently had great difficulty with breathing. Although he had fallen during attacks, he had never been incontinent nor had he ever bitten the tongue. After regaining consciousness he would be perfectly normal except that there would be severe sweating and weakness for a short period of time. The patient was so certain that swallowing caused the pain that for days at a time he would forego eating, to the point where he had lost 25 lb (11.3 kg) in the six weeks before coming to the hospital. He frequently refused to talk and would communicate only by writing. He even refused to swallow saliva and would permit it to drool from the side of the mouth into a cup. The history indicated that in March, 1949, what was considered to be a cold in the left ear developed prior to which he had always considered himself to be in good health. After this rather obscure cold in the left ear, he had the first attack of pain and unconsciousness, during which he fell and sustained abrasions to the face and nose. There had been recurrence of mild episodes in December, 1949, and in February, 1950, but the pain was not accompanied by syncope. The attacks, which began about six weeks prior to entering the hospital, had steadily increased in severity and frequency to the point where at times he might have 20 or 30 attacks during a 24 hour period. He consulted several physicians, including an otolaryngologist, but without diagnosis or any relief of his symptoms. In an effort to obtain relief he had the upper and lower molars on the left side extracted without the slightest benefit.

Physical examination on admission showed a haggard, unshaven, chronically ill, white man in his middle 30s. He carried a tin cup for the purpose of permitting saliva to drool from the right side of the mouth. The man talked, on those rare occasions when he would talk, in a coarse weak whisper. There was slight weakness of the right internal rectus muscle, known to have been present since at least the age of 13, with a slow minor nystagmus present on directing the eyes to the right. Complete neurological examination was otherwise entirely normal. Except for some degree of pyorrhea and evidence of recent extraction of the upper and lower molars on the left, the oral cavity and pharynx appeared normal. Gag reflex was hyperactive. There

3 Ray B S and Stewart H J. Glossopharyngeal Neuralgia. Cause of Cardiac Arrest. *Am Heart J* 35: 458 (March) 1948.

were no cardiac abnormalities, and rate and rhythm were normal. Repeated tests for carotid sinus hyperactivity were negative, and there was no evidence of postural hypotension. Blood pressure was 110/70 mm Hg. The remainder of the physical examination was within normal limits. Laboratory studies, including spinal fluid examination, were normal. Roentgenograms of the skull, sinuses, mastoid, chest, and esophagus demonstrated no abnormality. Minimal osteoarthritic changes were noted in the cervical spine films. Electroencephalograms and electrocardiograms were within normal limits.

During the first few days of hospitalization several attacks of pain and syncope were observed. On examination of the throat in the ear, nose, and throat department it was found that mechanical stimulation in the left tonsillar fossa would produce a typical attack of pain, and on the first occasion a brief clonic convulsion occurred that lasted about 20 seconds. Several attacks were induced before and subsequent to the administration of atropine. During the procedure the auscultatory blood pressure readings and electrocardiogram were recorded. After mechanical stimulation of the trigger zone in the left tonsillar fossa there was marked sinus bradycardia to about 15 per minute with transient drop in blood pressure from about 120/70 to 40/0 mm Hg and even occasionally to unobtainable levels, at which time marked facial pallor, brief unconsciousness, and convulsive movements of the extremities would appear. After each attack in which consciousness was lost there was prompt recovery, but weakness, sweating and headache were noted. On one occasion nodal rhythm was recorded, with a completely blocked ventricular response. The blood pressure dropped to 80 systolic with some pallor but no unconsciousness on this occasion. After intravenous administration of 1.2 mg ($\frac{1}{50}$ grain) of atropine another attack of severe pain was unaccompanied by cardiac slowing and the blood pressure remained unchanged at 130/80 mm Hg. After a number of induced attacks the trigger zone in the left tonsillar fossa became refractory to mechanical stimulation, and he experienced only mild twinges of pain thereafter during the hospital course. He was given belladonna tincture, 20 drops three times a day, and had no recurrence of syncopal episodes. He was discharged Aug 11, 1950, having gained 20 lb (9.1 kg) during his hospital stay.

He was readmitted to the hospital Nov 28, 1950, because of severe recurrence of pain, suffering 20 to 30 attacks daily. He had not, however, had a syncopal or convulsive episode while continuing to take belladonna. He presented the same appearance as on the first admission, except that he refused to utter a sound. He had lost weight and would not eat. He remained in bed, had repeated attacks of pain, and drooled constantly into tissue papers, which he deposited in wastebaskets at the bedside. Physical examination gave the same results as on the previous hospital admission. Prior to the administration of atropine, convulsive seizures appeared with the attacks of pain. Again the effect of atropine in blocking the cardiac slowing was demonstrated although the typical neuralgic pain was unaffected. On one occasion an attempt was made to block the glossopharyngeal and vagus nerve with local injection of procaine, following which stimulation of the tonsillar fossa had no effect. Shortly after the procedure he had a typical spontaneous attack, this occurring before an adequate block should have completely lost its effect. An electroencephalogram was again obtained, and after hyperventilation a typical seizure occurred, associated with moderate frontal slowing (frequency 6 cycles per second).

The patient was transferred to the neurological service. On Dec 7, 1950, with the patient in the upright cerebellar position, the left glossopharyngeal nerve and the upper two filaments of the vagus nerve were sectioned through the usual left suboccipital craniotomy. Atropine was administered before the nerves were approached. No lesion was observed in the area exposed by the operating surgeon, which included for the most part the cerebellopontine angle area. Except for some nausea and vomiting for four days, the postoperative course was uneventful. He remained free of his presenting symptoms and was discharged without medicaments of any type on Dec 22, 1950.

He returned for a follow up examination Jan 15, 1952 and considered himself to be well. There had been no recurrence of his previous symptoms. He was employed eight hours a day in an aircraft factory and worked an additional eight hours a day on his farm. He had noted occasionally that water came out of his nose if he drank rapidly and that he gagged fairly easily.

Physical examination was within normal limits. Neurological examination revealed a mild degree of loss of pain sensation over the second and third divisions of the left trigeminal nerve. It was thought this might be related to the fact that the trigeminal nerve had been deliberately exposed and examined during the surgery. Sensations of taste and smell were normal. The gag reflex appeared hyperactive. Stimulation in the area of the left tonsillar fossa produced no pain, and no vagal effect on the heart rate could be demonstrated by electrocardiography during such stimulation. Massage of each carotid sinus, separately and together, produced no evidence of increased sensitivity. An electroencephalogram was normal, as were skull and chest films.

COMMENT

We have presented a case characterized by pain typical of glossopharyngeal neuralgia and accompanied by cardiac slowing and periods of unconsciousness frequently with convulsions. No demonstrable lesion existed to explain this syndrome. The cause of glossopharyngeal neuralgia, as well as the cause of the other major neuralgias, is unknown.

The autonomic centers in the brain that regulate the cardiovascular and respiratory systems receive afferent impulses from many points throughout the body, however, stimuli arising in the carotid sinuses and aortic arch are known to be especially important in regulating blood pressure and cardiac rate. It is known that the glossopharyngeal nerve is an important contributor, together with perhaps the vagus, hypoglossal, and cervical sympathetics, to the carotid sinus. Intracranial section of the glossopharyngeal nerve and part of the vagus has been recommended for cure of syncope caused by hypersensitive carotid sinus.⁴ It is our assumption that, during the attacks of neuralgic pain, the glossopharyngeal nerve and its central pathways, which are presumably the principal pathways over which carotid sinus impulses are carried, are bombarded with an intense overload of afferent impulses. These travel to the autonomic centers of the brain and find their way to the vagus, which mediates the increased "vagal effect" with cardiac slowing and blood pressure fall, to the point where cerebral ischemia occurs. This results in syncope and convulsions exactly like that seen in the carotid sinus syndrome. We have demonstrated that atropine will abolish the vagal response even though the neuralgic pain is unaffected. Atropine or its derivatives can be used, at least temporarily, to prevent the syncope and convulsions until complete cure can be effected surgically. Topical anesthesia to the trigger zone should be effective for brief periods of time in abolishing the attacks so that the patient can take nourishment and thus avoid severe dehydration and weight loss. It should also be possible to control this syndrome for short intervals by the use of the procaine block of the glossopharyngeal and vagus nerves on the side involved.

The permanent cure is easily effected, as demonstrated in this case, by intracranial section of the glossopharyngeal nerve and the upper two filaments of the vagus nerve. The operation is so simple and safe that we believe it should not be withheld from such a suffering patient for any undue length of time.

TABETIC CRISES TREATED WITH CORTICOTROPIN

REPORT OF A CASE

Alfred L. Weiner, M.D.

and

Harry R. Mendelsohn, M.D., Cincinnati

The lack of definitive treatment and the consequent difficulties that arise in the management of the patient with severe crises of tabes dorsalis are well known. At the same time, the capricious nature of this syndrome makes the evaluation of any therapeutic measure difficult and generally unsatisfactory. Because the patient in the case report that follows failed to respond to some of the more usual therapies for gastric crises, corticotropin was administered intravenously. The apparent favorable response together with our failure to find any recorded reference to such treatment of tabetic crises prompted us to report this experience.¹

REPORT OF CASE

The patient, a white woman, aged 40, first came under observation of one of us (H. M.) on Dec. 24, 1947, when she was complaining of cramping pain in the upper abdomen and persistent vomiting and nausea of four days' duration. This illness did not respond to symptomatic medication, and the patient was admitted to the Mercy Hospital on Dec. 27. At this time the positive physical findings consisted of moderate dehydration, atonic bladder, fixed unequal pupils, hyperactive tendon reflexes, and positive Romberg sign. The abdomen was soft and no masses or organs were palpable. The gastrointestinal series and flat plate x-ray examinations of the abdomen revealed no abnormalities. The diagnosis of tabes dorsalis with gastric crises was made on the basis of the history of the present illness and findings, the history of previous antisyphilitic treatment, persistently strongly positive serologic tests for syphilis (blood), and spinal fluid studies that showed positive Wassermann, Kolmer and Eagle reactions, 4 white blood cells per cubic centimeter, and a first zone gold curve reaction. The protein content was not determined.

The patient was treated with Wangensteen irrigation, repeated catheterizations, various sedative, antispasmodic and anodyne medicaments, and injections of aqueous penicillin in divided doses of 30,000 units every four hours (a total of 9 million units was administered during this hospitalization). The nausea and vomiting persisted unabated until Jan. 2, 1948, however. The patient also began voiding voluntarily on this date and had made a complete recovery by Jan. 13 when she was discharged from the hospital. After this she was given daily injections of penicillin in oil and beeswax (300,000 units each) to a total of 10 million units and then weekly or semiweekly phenarsone (Aldarson), oxophenarsine (Mapharsen), or bismuth subsalicylate injections (30 each) were administered. There were no further disturbances, and reexamination in October, 1948, showed no additional neurological findings except that the bladder was functioning normally. The Kahn, Kline, and Pangborn reactions were strongly positive in a dilution of 1:8 and the spinal fluid showed a strongly positive Wassermann reaction, third zone gold curve, 20 mg per 100 cc of protein and 2 lymphocytes.

The patient had no further difficulty until Dec. 10, 1952, when she again began to have persistent and severe nausea and vomiting together with epigastric pain radiating to the anterior part of the chest. These vomiting attacks continued despite symptomatic ambulatory treatment. The patient became exhausted and dehydrated and was readmitted to the Mercy Hospital on Dec. 16, 1952. At this time the abdomen was again

soft, and no masses or organs could be felt. The significant physical signs consisted of severe dehydration, distention of the bladder, fixed unequal pupils, and hyperactive tendon reflexes. In view of the previous episode and the absence of other apparent causes in explanation of the patient's symptoms, the diagnosis of tabetic crises was again made. She was treated by means of sodium chloride and glucose intravenously, with and without the addition of vitamin B complex mixtures, and received meperidine (Demerol) and sodium phenobarbital (Luminal) injections at frequent intervals. The nausea and vomiting persisted during the next two days. On Dec. 18, at which time the nausea and vomiting had been persistently present for eight consecutive days, 10 mg of corticotropin in 500 cc of 5% glucose in normal sodium chloride solution were administered. Within four hours the patient was more comfortable and, although there was some nausea, the vomiting had ceased. Ten milligrams of corticotropin in sodium chloride and glucose solution were given intravenously on Dec. 19 and the dosage was increased to 15 mg on Dec. 20 and Dec. 21. There was no vomiting and very little nausea on Dec. 19, 20, and 21, and the patient voided a small amount of urine for the first time on Dec. 22. Corticotropin therapy was discontinued on Dec. 22 and cortisone in a dosage of 100 mg daily was given. By Dec. 23 the patient was completely comfortable and was voiding normally. There was no pain, nausea, or vomiting. The improvement continued, and there were no further symptoms. The patient was not discharged from the hospital until Dec. 28, although she had for all practical purposes fully recovered by Dec. 24. The serologic tests of the blood showed a positive reaction with the Venereal Disease Research Laboratory test and the spinal fluid Wassermann reaction was negative, as was the gold curve reaction. The spinal fluid contained 10 mg. per 100 cc of protein and three lymphocytes.

SUMMARY AND CONCLUSIONS

While one cannot exclude the possibility of spontaneous arrest of the symptoms in patients with tabetic crises, it appears most probable that intravenous administration of corticotropin was responsible for the rather dramatic response in this patient. In the 1947-1948 episode the total duration of the attack was some 13 days and seemed entirely unaffected by the various treatment measures. In the 1952 attack relief was observed on the eighth day in a matter of hours after the initial dose of corticotropin. Since intravenous administration of glucose alone has been known to be followed by relief of crises, it is noteworthy that this did not occur until the corticotropin was added in this instance. One can only speculate as to the mechanism of the apparent beneficial effect of corticotropin in this patient. On the basis of this limited experience, however, we believe that this method of therapy should be tried in additional patients with crises and perhaps even in other acute manifestations of tabes dorsalis.

Artificial Pneumothorax.—As a major weapon in the treatment of tuberculosis, pneumothorax has been defeated by the deceptive simplicity of its technique, which encouraged its employment in unsuitable cases and in unsatisfactory conditions.

Its limitations are clearly understood now, it is being practiced with greater care and discrimination than ever before, but developments in other fields have provided alternatives, and it is doubtful if in the future pneumothorax will occupy more than a minor place in treatment. It is rapidly becoming extinct in areas where surgical facilities are readily available.

Lack of surgical facilities in certain regions will ensure its survival for some time yet, but on a gradually diminishing scale.—R. Y. Keers, M.D., Complacency or Conquest?, *Edinburgh Medical Journal* March, 1953.

METHEMOGLOBINEMIA RESULTING FROM THE ABSORPTION OF SODIUM NITRITE

REPORT OF A CASE

*Capt Irving H Rozenfeld (MC), U S A F
Oklahoma City*

The occurrence of methemoglobinemia in children as a result of the ingestion, absorption, and inhalation of a great variety of chemical compounds is well recognized. The chemicals most commonly reported to be ingested are nitrates and nitrites, although such compounds as aniline dyes, acetophenetidin, sulfonamides, toluene, and others¹ have also been implicated. Stevens² has reported a case of methemoglobinemia in infancy resulting from the inhalation of nitrobenzene. Methemoglobinemia resulting from absorption of aniline compounds through the skin has frequently been reported since Rayner's³ case in 1886. In most of these cases, aniline dye used as laundry identification marks in diapers was the causative agent, but industrial compounds such as 2-anilinoethanol can also cause methemoglobinemia.⁴ Following is the report of a case of acute methemoglobinemia resulting from the absorption of sodium nitrite through a burned area.

REPORT OF A CASE

A 3½-year-old white boy was admitted to the hospital on March 27, 1952, with first, second, and third degree burns involving an estimated 45% to 55% of the body area. On initial examination he appeared to be in a semishock state with first, second, and third degree burns noted about the chest, neck, back, right arm, right thigh, and right leg, and second degree burns about the face. The initial blood studies revealed a white blood cell count of 18,200 per cubic millimeter, 13.8 gm of hemoglobin per 100 cc, and a hematocrit reading of 40 cc. The burns were covered initially with pressure petrolatum (Vaseline) dressings. At that time the administration of plasma, blood, and fluids intravenously was started through a cut-down in a superficial vein of the leg. The patient's fluid and electrolyte balance was followed closely for three days, after which he took adequate fluids and food by mouth although he still required transfusions from time to time.

The dressings were first changed on April 4, 1952, with the patient under general anesthesia. Dressings were removed, the burns were débrided carefully and cleansed thoroughly with benzalkonium (Zephiran) chloride solution (1:1,000), and the patient was returned to the ward in good condition. The next change of dressing was accomplished on April 11, 1952, again with the patient under general anesthesia. The patient's condition on entering surgery was good. The burned areas were again débrided and irrigated thoroughly with the benzalkonium chloride solution. While the petrolatum pressure dressings were being applied the patient was noted to be cyanotic, but his pulse was only moderately elevated from the rate observed at the beginning of the procedure. His airway and oxygen supply appeared adequate, and respirations were normal. He was receiving a blood transfusion at the time the cyanosis occurred. Approximately 100 cc of blood was forced into the vein under pressure and 100% oxygen was given through an endotracheal tube but the patient's bluish gray discoloration did not improve. The cyanosis actually appeared to be somewhat worse after the transfusion.

The patient was returned to the ward and placed in an oxygen tent, however, his color continued to be grayish blue. No other abnormal physical findings were noted. A complete blood cell count performed at this time revealed 31,000 white cells with 69% neutrophils, 28% lymphocytes, and 3% monocytes. The red blood count was 4,300,000, with 13.1 gm of hemoglobin. A roentgenogram of the chest showed no abnormality. Inquiries in both surgery and pharmacy departments about one and one half hours after the patient had returned from surgery revealed that the benzalkonium chloride (1:1,000) solution used to irrigate the burns also contained sodium nitrite. Approximately 7 grains (0.5 gm) of sodium nitrite, ordinarily used to prevent oxidation of surgical instruments had been added inadvertently to 4,000 cc of the benzalkonium chloride solution. A tentative diagnosis of methemoglobinemia as a result of the absorption of sodium nitrite through the burned area was made. A sample of blood was collected under oil and the patient was then given 2 cc of 1% methylene blue intravenously over a three minute interval. Within 20 minutes the patient's color was normal, and all evidence of cyanosis was gone. The blood specimen collected under oil was examined spectrophotometrically, and the analysis confirmed the diagnosis of methemoglobinemia.

COMMENT

This case demonstrated the fact that methemoglobinemia can result from the absorption as well as the ingestion of nitrites. It reemphasizes the fact that absorption through a burned area is increased and that the composition and identity of all medicaments must be repeatedly checked.

Cancer in Children—Contrary to popular belief, cancer in children is primarily a problem for general practitioners and pediatricians and only secondarily for surgeons and radiologists. After all, the success or failure of the latter's technical therapy depends on an early diagnosis by the family physician.

The most important single factor in the early diagnosis of cancer is that the physician should be constantly on the alert for its occurrence, and that his mind should be so conditioned to suspecting its presence that he includes it in virtually every differential diagnosis. The early symptoms of childhood cancer are often vague and obscure, and frequently are similar to those seen in the usual childhood diseases. It is only in the late phases that the commonly described signs of anorexia, weight loss, anemia, large palpable masses, etc., are seen. To diagnose it early, one must suspect its possibility in any child with enlarged lymph nodes which have persisted beyond the usual few days when they are due to infection, intermittent fever, anorexia, weight loss, vague, persistent slowly increasing bone pain in one extremity, even though no tumor is palpable, dilatation of one pupil, especially if a white or grayish reflex is present, recurrent dizziness, headache, vomiting without nausea, unsteadiness of limbs, partial loss of vision, sensory changes, lack of sphincter control, bleeding from any body orifice, painless masses of any kind in any location. In other words, cancers of all types occur in children and no organ can be considered immune. —J H Bufkin, R.N., R.R.L., and W C Davison, M.D., *Childhood Cancer (Tumors, Leukemia, and Hodgkin's Disease), The Journal of Pediatrics*, May, 1953.

SPECIAL ARTICLE

MR R F SHROPSHIRE'S NONSURGICAL TREATMENT OF CATARACT

The following report was prepared by the Committee on Ophthalmology of the Division of Medical Sciences of the National Research Council—Ed

On Sept 12, 1952, there appeared in *Science* an article by R F Shropshire, Jacob R Ginsberg, and Mendel Jacobi¹ reporting beneficial effects from the nonsurgical treatment of cataract with injections of fish lens protein. Because of the widespread public interest that it aroused and because of the inadequacy of the evidence presented, the Council of the American Academy of Ophthalmology and Otolaryngology petitioned the National Research Council to investigate the authors' claims. An investigation was made by the National Research Council Committee on Ophthalmology, whose findings and recommendations form the basis for this report.

The hypothesis that lens antigens might be useful in the treatment of cataract is not new. In 1908 Romer² reported success in treating cortical cataract with tablets of mammalian lens protein. In 1923 Davis,³ in this country, attempted active immunization with bovine lens material. The latter's favorable reports led to a number of other investigations.⁴ These, however, failed to confirm Davis' findings, and the proposed therapy lapsed into obscurity.

The use of fish lens protein was attempted in 1933 by Lewis,⁵ with whom its present proponent, Mr R F Shropshire, was then associated. Again favorable results were claimed but the ophthalmologic details presented were unconvincing, and the report aroused little interest on the part of the profession.

Mr Shropshire's interest, however, continued, and in 1937 he published two papers⁶ on the subject. In addition to reviewing Lewis' work, he cited a paper by

Hektoen and Schulhof⁷ as evidence that the lens proteins of fish are immunologically different from those of mammals. In fact, these authors had specifically stated that fish lens contains antigens that interact with mammalian lens, in addition to others that are species specific. Shropshire also reported chemical differences between piscine and mammalian lenses, being able to account for only a part of the sulfur content of fish lenses, he postulated the existence of a previously undescribed sulfur-bearing amino acid of therapeutic value. Unfortunately his analytical methods were not suitable for the detection of either cystine or methionine, the latter alone accounts for about half of the sulfur present, and cystine and cysteine almost completely account for the rest.⁸

The chemical argument is extended in the recent paper of Shropshire, which reports that differences were found between the electrophoretic and ultracentrifugal patterns of mammalian and piscine lens proteins. According to the detailed report furnished the committee, these studies were performed by Dr Kurt G Stern with human and piscine lenses. Since the patterns of bovine and human lens proteins are also very different from one another, the observations of Stern do not support Shropshire's claim that fish lens has distinctive qualities of possible therapeutic value. In any case no deductions as to antigenic behavior can be made legitimately from physicochemical measurements of the type described.

The article in *Science* is chiefly notable for its reports of the successful treatment of cataract in rats and humans with injections of fish lens protein. On investigation, it developed that cataracts had been induced in the rats by feeding them galactose. Since such cataracts appear superficially to clear when the administration of galactose is stopped regardless of treatment, these observations do not provide convincing evidence in favor of the fish lens therapy.

The most impressive claim was that of improved visual acuity in the patients treated by Shropshire's co-authors, Drs Ginsberg and Jacobi. The article referred to an initial group of 14 patients, described in general terms, and an additional 12 whose acuities before and after treatment were given in a table. In order to provide an independent evaluation of these claims, arrangements were made to have a subcommittee of the Committee on Ophthalmology examine a group of patients selected by the proponents of the therapy. Eleven patients were examined, all of whom were enthusiastic about the benefits that they had obtained. The findings were compared with those recorded when the treatment was begun. In six patients the visual acuity was less than before treatment, and the cataracts appeared to have progressed steadily in the usual fashion. Two others showed little or no change. Three showed slight or questionable improvement, two of these had vitreous opacities, and their subjective reports clearly supported the conclusion that the improvement had been due to shifting of these opacities out of the line of vision. In only one patient did the data appear to suggest an actual improvement, since, however, neither Shropshire nor his collaborators were ophthalmologists, their original estimate in this case may have been in error.

The subjective improvement, in most cases, was in near vision, the obvious explanation of this is the development of functional myopia in a progressing cataract. Two patients, as mentioned, were pleased because their vitreous opacities seldom bothered them, and another because his sensitivity to light and multiple vision when looking at lights had disappeared. With the possible exception of one patient, therefore, there was no evidence that the normal course of the cataracts had been affected by the treatment.

A later report received by the committee described the results of treatment administered independently by an ophthalmologist on the staff of a recognized medical school, using fish lens protein supplied by Mr. Shropshire. The cases were unselected, and included 14 eyes with cataracts in 9 patients. No objective change in the cataracts could be discovered, in four cases vision as measured by the test chart was slightly improved, while in two it was worse. Seven patients reported subjective improvement, which the physician considered to be psychological, one felt that she was worse.

Further evidence indicates that treatment with foreign lens proteins is not merely ineffective but also hazardous to the patient. Posner⁹ has recently called attention to serious reactions, leading in one case to total blindness, in patients sensitized to their own lens protein by injections of both beef and fish lens extracts, he warned ophthalmologists of the dangers that may arise when such patients come to operation. This was corroborated by a member of the committee, who referred to the unfortunate postoperative histories of patients treated unsuccessfully with beef lens protein. It should further be noted that of 12 sample bottles of the fish lens preparation furnished to the Ocular Research Unit of the Walter Reed Army Hospital by the Cataract Institute, 10 were contaminated with pathogenic organisms.

The committee also inquired into the backgrounds and qualifications of the proponents, to determine how much credence might be given to their reports. No evidence was found that Mr. Shropshire had any formal scientific training, claims that he was a graduate physician and had conducted research in ophthalmological chemistry at two universities were not substantiated by the institutions concerned. He has, however, tried his hand at a variety of scientific undertakings. As noted above, he was an assistant to the late Dr. F. Park Lewis, an ophthalmologist, about 1933, at which time he published a paper on the eye of the trout. Subsequent activities included two appointments as a laboratory technician in pathology, from which he was dismissed for lack of competence and for unreliability due to drug addiction, and brief experience in research in underwater sound. In 1944 he posed as a pathologist in Florida and, after pleading guilty on three counts of forging prescriptions for narcotics, was sentenced to serve five years on the first count and five on the second, the sentences to run consecutively. About one year later he was paroled. This parole was revoked in 1948, excessive use of alcoholic drinks, suspected use of narcotic drugs, and issuing of bad checks were given as the reasons. It was following a second parole in 1949 that he engaged, with private

sponsorship, in his recent studies on experimental cataract in the rat.

In a chance meeting with Shropshire, a New York business man, Mr. Saul Gaynes, became interested in the financial possibilities of the fish lens preparation. Clinical trials were begun by his brother, Dr. Ginsberg, a general practitioner, and Dr. Jacob, an internist. Encouraged by the early reports, Gaynes and Shropshire incorporated the Kortright Industries to manufacture and sell the preparation. With three others they also established the Cataract Institute, as a nonprofit corporation to conduct research on the pathogenesis and therapy of cataract, and Shropshire was given a five year contract as consultant. A third physician later joined the group, Dr. Jacob Weynert, an orthopedist. For a time patients were examined by opticians in the employ of a New York optical company.

In summary, the committee found nothing in the theoretical background or in the experimental and clinical results of this therapy to recommend it. It did, however, find evidence that the treatment might seriously interfere with the subsequent surgical removal of the cataracts that it had failed to cure. In view of these facts, the committee adopted the following statement of its conclusions:

"Because of the total lack of evidence that the lens antigen treatment of cataract described by Mr. R. F. Shropshire (*Science* 12 September 1952) has any efficacy, because adequate evidence is now available to the Committee that it is, in fact, without demonstrable efficacy, and because treatments of this type have been thoroughly investigated in the past and proved not only invalid but potentially dangerous to the patient, this Committee does not recommend further investigation of this treatment by any agency."

Laboratory Data and Clinical Judgment.—The question sometimes arises as to what extent can one substitute laboratory data for clinical judgment. Also, to what extent can clinical experience concerning the usual course of a disease replace laboratory data. It is apparent that, in general, these two sources of information must be correlated and integrated with one another. It is only through such a combination that one can provide the best possible care for the patient.

The doctor must remember that laboratory data are not necessarily correct. It is necessary to be sure that only verifiable information shall enter into the reasoning of the physician. Abnormal results that may influence diagnosis or therapy should be thoroughly established and verified, particularly if they seem inconsistent with the rest of the laboratory data and clinical picture. It is surprising how often isolated determinations are used as a basis for diagnosis and medication without adequate verification. Not only do analytical errors occur, but there are errors in the collection and preservation of specimens. For example, chloride, carbon dioxide and pH values may be misleading if the blood is not collected correctly. Twenty-four hour urine specimens are very frequently unreliable as indicated by wide variations in creatinine excretion on successive days in the same individual. Furthermore, a specimen may have been collected at a time that was not representative of the patient's condition.—S. Freeman, M.D. *Relating Biochemistry to Clinical Judgment, The Illinois Medical Journal*, May, 1953.

COUNCIL ON PHARMACY AND CHEMISTRY

The following abstract of recent nomenclature decisions of the Council is authorized for publication

R T STORMONT, M D, Secretary

NEW GENERIC AND BRAND NAMES RECOGNIZED BY THE COUNCIL

The Council collaborates with manufacturers in the selection of generic and brand names for marketed drug preparations presented for acceptance and also for new products still under development or clinical trial. The last report on such names appeared in *THE JOURNAL*, March 21, 1953, page 1000.

The following abstract lists the generic designation, the chemical name, where necessary for information, and the brand name or names simultaneously recognized for the stated firms. In general, a generic name should bear recognizable relation to the chemical name and conform as closely as consistent with brevity and practicality to existing systems of scientific nomenclature. The chief requirement for a brand name is that it should not be therapeutically suggestive.

The listing of a brand name is not to be construed as indicating Council acceptance of the product itself. Products accepted for inclusion in New and Nonofficial Remedies are announced separately.

ANTIHEMOPHILIC PLASMA (HUMAN) for a preparation of human plasma designed to preserve the antihemophilic globulin component

ARSTHINOL (formerly **MERCAPTOARSENOL**) for 2-(3'-acetamido-4'-hydroxyphenyl)-1,3 dithia 2 arsacyclopentane 4-methanol Balarsen (Endo Products, Inc)

AUROTHIOGLYCANIDE for aurothioglycolanilide Lauron (Endo Products, Inc)

CHLOROPROCAINE PENICILLIN O for the chloroprocaine salt of penicillin O. Cer O Cillin Chloroprocaine (The Upjohn Company)

CHLORQUINALDOL for 5,7-dichloro 8 oxyquinaldine Sterosan (Geigy Pharmaceuticals)

FUMAGILLIN for the antibiotic produced by certain strains of *Aspergillus fumigatus* Fumidil (Abbott Laboratories)

LEVORPHAN TARTRATE for levo-3 hydroxy N-methylmorphinan tartrate Levo-Dromoran Tartrate (Hoffmann LaRoche, Inc)

NEOMYCIN SULFATE for the antibiotic produced from cultures of *Streptomyces fradiae*

PRAMOXINE for γ -morpholinopropyl 4-n butoxyphenyl ether Tronothane (Abbott Laboratories)

PRIMOSTRUM for a preparation of primiparous colostrum Quest (General Pharmacal Corporation)

RACEMORPHAN HYDROBROMIDE (formerly **METHORPHINAN HYDROBROMIDE**) for dl 3 hydroxy N methylmorphinan hydrobromide Dromoran Hydrobromide (Hoffmann LaRoche, Inc)

SOMATOTROPIN for the somatotropic ("growth") hormone derived from the anterior pituitary gland

STANOLONE for androstan 17(β)-ol 3-one Neodrol (Foundation Laboratories, Inc Syntex)

STILBAMIDINE ISETHIONATE for 4,4'-stilbenedicarboximidine di-(β) hydroxyethanesulfonate

SUCCINYLCHOLINE CHLORIDE for diacetylcholine dichloride Anectine Chloride (Burroughs, Wellcome & Company)

TOLAZOLINE HYDROCHLORIDE for 2 benzyl 2-imidazoline hydrochloride Priscoline Hydrochloride (Ciba Pharmaceutical Products Inc)

REPORT TO THE COUNCIL

The Council has authorized publication of the following report from the Committee on Pesticides

R T STORMONT, M D, Secretary

The following report is the eleventh in a series of published statements by the Committee on Pesticides. Information on previous reports may be obtained from the Committee office

BERNARD E CONLEY, Secretary,
Committee on Pesticides

TOXICOLOGY IN MEDICAL CURRICULUM

Growing recognition of the health problems of pesticides and other commonly used chemicals found on the farm and in the home has fostered numerous suggestions for informing physicians about those products that have obvious or latent potentialities for harm. Greater emphasis on the pharmacological and toxicologic properties of many of the newer agents is being given at medical meetings, in professional journals, and, to some extent, in undergraduate and postgraduate instruction. Despite this activity, a tendency exists to dismiss medical problems involving nondrug compounds as the concern of the rural practitioner or the industrial physician. This attitude is both unjustified and unrealistic in view of the widespread use of pesticidal and other household chemical products.

Exposure to chemical substances capable of causing injury is no longer simply an agricultural or industrial hazard. It exists in and around the home—on the pantry shelf and in the cellar, utility room, garage, tool shed, or workshop where chemical products are employed for the pursuit of a hobby, repair of the premises, or for the cleaning, deodorizing and disinfecting of household goods. Many of these products contain essentially the same chemicals as those encountered in agriculture or industry yet users are often ignorant or neglectful of the hazards attending their misuse.

Practicing physicians as well as medical students should be informed of the dangers of widely used, nonmedicinal chemicals, and should be familiar with methods for the prevention and treatment of accidental poisoning. The great influx of agricultural, industrial, and household chemicals during the last decade taxes the capacities of even those with a special interest in these compounds to keep abreast of current information. An unprecedented demand has arisen to include additional subjects in pharmacology in the medical curriculum. Nevertheless, the increase in the number and availability of poisonous substances in general use warrants not only the interest and attention of all members of the medical community but also favorable consideration of every practical measure for increasing the medical profession's knowledge of these substances.

On several occasions the American Medical Association has officially taken cognizance of this matter. In November, 1948, a Conference on the Health Hazards of Pesticides was called, which subsequently led to the formation of the Committee on Pesticides. A resolution was adopted by the House of Delegates in December, 1951, calling for the accumulation and dissemination of information on potentially poisonous household products. In addition, a statement was presented by the Committee on Pesticides before the 1953 annual meeting of the American Society for Pharmacology and Experimental Therapeutics, urging greater consideration of pesticides and related products in the pharmacology programs of medical schools. These actions represent informed opinion on the need for greater awareness of the health problems of commonly used chemicals.

In the field of pest control compounds, this matter is receiving wide attention. The Committee on Pesticides periodically publishes comprehensive reviews on the pharmacology and toxicology of recent agents that have received general acceptance. To assist instructors in pharmacology, the Committee has prepared outlines of information for short and more extensive lectures on pesticides and related materials for use in teaching. These, and the articles that the Committee has published in *THE JOURNAL*, are available on request.

A MEDICAL FISH STORY

A report of the Committee on Ophthalmology of the National Research Council, Division of Medical Sciences, on the fish lens protein treatment for cataract appears elsewhere in this issue (page 707). As is mentioned in the report, an investigation was made because of widespread public interest in what appeared to be an escape from necessary surgery in the treatment of cataract. Such interest resulted from newspaper stories, which, unfortunately, aroused false hopes in many persons. These stories were based on a report in *Science*, a reputable scientific weekly, in September, 1952.¹ Since that time two or three physicians in the New York metropolitan area have treated many patients. THE JOURNAL has published an earlier warning² of possible untoward results of this injection therapy, and the dangers of this therapy are again mentioned in a clinical note in this issue (page 698).

The principal author of the *Science* report is, according to most recent authentic information, in prison in Florida, awaiting a hearing on the matter of revocation of his parole for alleged violation of the terms thereof. Presumably, these alleged infractions did not involve the matter of participation in the treatment of persons with cataracts with what may well have been contaminated fish lens protein material. Such activity would, however, appear to be the most serious aspect to be considered, from the standpoint of those who received the treatment. His medical confrères should consider seriously these effects.

NUTRITION AND APOENZYMES

One of the most widely used criteria of nutritive success or failure in experimental nutrition has been the change of body weight. Indeed, the entire concept of indispensability of a given dietary factor rests largely on the maintenance or failure to maintain an increase of body weight in young animals or a steady state in adults. This change in mass in experimental animals is tacitly attributed largely to tissue protein, a concept greatly fortified by the demonstration¹ of the large loss of protein from various tissues of the body during relatively brief periods of inanition. Later it was shown² that in a fast of seven days not only the body weight decreased but also a loss of hepatic protein and a decrease in concentration of various enzymes of the liver occurred. Although these losses in hepatic enzymes are greater than the loss of liver protein, they are related to each other.³

When liver tissue is homogenized to a cell-free preparation, the material can be separated mechanically into a nuclear fraction, the large granular fraction or mitochondria, and the residue. An assay of the fractions for succinic dehydrogenase, cytochrome oxidase, and adenosinetriphosphatase shows that these enzymes occur in highest concentrations in the mitochondrial fraction.⁴ Histological examination of liver homogenates shows that during inanition the mitochondria may practically disappear. It appears, therefore, that in a condition of protein starvation both the chemical and the structural features of cellular enzyme activity may be affected.

In recent studies on the effect of dietary protein on the activity of the enzyme xanthine oxidase of the liver, it was shown that the availability of the amino acids in the protein of the ration influences the enzyme.⁵ The xanthine oxidase concentration in this tissue is extremely dependent on the presence of methionine⁶ and, to a lesser extent, of tryptophan.⁷ In all cases studied, realimentation with adequate quantity and quality of dietary protein reestablished the original level of enzyme activity.

Inasmuch as xanthine oxidase is an enzyme complex, a decrease of activity may be due to a deficiency either of the coenzyme part or of the apoenzyme (protein) part. That the diminution of hepatic xanthine oxidase activity is due to the lack of the apoenzyme component has been strongly suggested by experiments⁸ in which the inactive homogenate from the livers of rats on a protein-free diet was supplemented with an appropriate coenzyme preparation without noticeable effect on the activity. Again, when diammonium citrate or urea was added to diets containing the 10 essential amino acids not only the previously demonstrated stimulation of body growth was observed but the level of hepatic xanthine oxidase activity was maintained at the normal level.⁹ The foregoing observations indicate that the formation of enzyme complexes is closely dependent on the adequacy of protein nutrition, probably because of the amino acid requirements for the elaboration of the apoenzyme (protein) part of the enzyme system. The extreme sensitivity of the enzymes that have been studied to the availability of dietary amino acids suggests that many cellular enzymes, both mitochondrial and cytoplasmic, are far more labile than the structural proteins of the cell. Since enzymes are the mediators of metabolism, the importance of these effects is obvious.

WHOLE LIFE RECORDS

Medical records are kept for two purposes to aid in the care of the patient at hand and to provide data from which new knowledge can be gained, for the benefit of future patients. As the goals of medical practice broaden, medical records must become more comprehensive. For the physician whose sole aim is the treatment of diseased persons, a simple record of the course of the disease and the therapeutic agents used may be adequate, but, when the goal is broadened to include the prevention of disease and the cultivation of optimum physical and mental health, then more data on the patient and his environment must be recorded. The many hereditary, congenital, metabolic, traumatic, psychological, climatic, occupational, social, and other factors that may contribute to the production of health or disease must be investigated and recorded so that their medical significance can be determined. With knowledge gained in this way it may eventually become possible to predict, and perhaps to prevent, the occurrence of some of the chronic, degenerative, and neoplastic diseases that form such an important part of medical practice today. Only through the analysis of large numbers of such records, however, will it be possible to evaluate adequately the role of many of the factors mentioned.

The accumulation of large numbers of such comprehensive lifetime medical records from different segments of the population is a tremendous task, but it is being undertaken in a number of research centers in this country. Dr. C. Ward Crampton¹ has presented to the New York County Medical Society a plan that he believes would enable all practitioners to accumulate whole life records. This plan proposes that all persons be given an exhaustive physical and functional examination at six points in life: birth, admission to school, puberty, marriage, climacteric, and old age. At the same time a cumulative and comprehensive personal and medical history should be obtained. These examinations would supplement but not replace the more limited annual physical examination, which usually is used for immediate diagnosis and treatment rather than for long-range research and charting of the patient's future medical course. The examination at birth would normally be preceded by prenatal examination of the mother to determine whether there were any infectious, toxic, nutritional, or other factors that might influence the development of the fetus; a complete family history would also be taken at this time. The preschool examination would include tests of mental, physical, and social development, and a record of personal adjustment to date. At puberty and the climacteric, emphasis would be placed on endocrine and psychological adjustment, and the premarital examination would be regarded as a preparental examination as well. The geriatric examination, performed at about the patient's 65th birthday, would afford an excellent opportunity for the physician to detect early deterioration or chronic illness and correlate it with factors found in earlier examinations. At the time of each examination, the patient's entire life record would be reviewed and necessary corrective or preventive measures instituted. A condensed or coded version of the history might be given to the patient so that he could present it to any physician in an emer-

gency, or to examiners or counselors at schools, camps, and employment or military agencies. Additional data and comments might be added by these examiners. At the person's death the comprehensive history could be correlated with autopsy findings, when possible, and the whole made available to medical statisticians for analysis.

This program deserves careful study. Whether it could be made practical on a large scale, outside of research centers, depends on the thoroughness of the original planning, the interest and enthusiasm of all participating physicians, and the time and facilities available to them for the examinations. Unless a carefully prepared standard form were used, records prepared by many examiners might vary so much in content and detail that they could not be compared directly. Without adequate time or motivation the examiner might fail to fill out a standard form in sufficient detail. Without special laboratory and diagnostic facilities and the services of several consultants, the examiner might not be able to study many important antecedents of disease. None of these problems is insurmountable, however, and it is probable that a program of this type, if properly executed, would yield rich dividends.

VERRUCA VULGARIS VIRUS

There is abundant evidence that the common wart is caused by a filtrable agent. On the hypothesis that this agent may be a virus, Bivins¹ of Rutgers University attempted its cultivation by inoculation on the chorioallantoic membranes of chick embryos. He removed a wart from his own hand by curettage and ground it to a fine powder with sterile sand. This powder was suspended in 3 to 4 cc of nutrient broth and frozen. Twenty-four hours later the material was thawed and centrifuged, and to 1 cc of the resulting supernatant fluid there was added 0.2 cc of 85% sodium chloride containing 10,000 units of penicillin and 10 mg of dihydrostreptomycin. The resulting mixture was inoculated in 0.2 cc doses on each chorioallantoic membrane of a group of 10-day-old embryonated chick eggs.

Eggs examined on the seventh day after inoculation showed lesions at the inoculation site varying from sandpaper-like granulations to one or more hard whitish "pearls" about $\frac{1}{8}$ in (0.32 cm) in diameter. Subsequent passage of the material from these pearls routinely showed a production of dense whitish or greenish warts varying from $\frac{1}{16}$ to $\frac{3}{16}$ in (0.16 to 0.48 cm) in diameter, which occasionally coalesced to form a yellowish mass resembling necrotic tissue. Since Berkefeld filtrates from these warts reproduced similar lesions in 10-day-old chick embryos, it seems probable that a virus had been cultivated.

ORGANIZATION SECTION

THE ANNUAL MEETING IN NEW YORK

The 102nd annual meeting of the American Medical Association passed on into history on June 5, leaving New York City, perhaps, a little surprised at the record breaking attendance and all of the registrants grateful to the great metropolis for its hospitality. The attendance at this meeting was the largest in the history of the Association and it was no doubt the largest medical meeting that this world has ever seen. The total registration, including guests and exhibitors, was 48,980, of whom 17,958 were physicians. One hundred years ago when the Association first met in New York City, the attendance was 573. The Association met there again in 1864, again in 1880, at which meeting THE JOURNAL of the American Medical Association was authorized, again in 1917, and again in 1940, when the number of physicians registered was 12,864. At the centennial meeting of the American Medical Association in Atlantic City in 1947, 15,667 physicians registered, making that meeting the largest one up to that time. Despite the heavy registration in New York, with a large well-organized staff and IBM machines, registration proceeded smoothly and at a faster rate than ever before. The 21 scientific sections held their individual meetings at six different hotels and at Town Hall in Manhattan, some a considerable distance apart, but fortunately on the lower floors of the tall buildings. The scientific and technical exhibits were at the Grand Central Palace and the House of Delegates' meetings at the Waldorf-Astoria Hotel. Some 400 papers were presented before the various sections of the scientific assembly. There were 260 scientific exhibits and 370 technical exhibits, and medical motion picture and colored television programs were presented daily. Many special groups, not officially connected with the A. M. A., held their meetings preceding or immediately following the great event. Among these special groups were the American Rheumatism Association, American Diabetes Association, American Geriatrics Society, American Academy of Tuberculosis Physicians, American College of Chest Physicians, American Society for the Study of Sterility, American Medical Women's Association, the Society for Vascular Surgery, the Endocrine Society, the Society for Investigative Dermatology, and the conference of presidents and other officers of state medical associations. Perhaps the strongest single impression made on one attending this assembly was the vastness of medicine today and the far-reaching influence it has on the welfare and the sociological and economical aspects of the lives of the people of the United States.

Elsewhere in THE JOURNAL (page 719) is the first installment of an abstract of the proceedings of the House of Delegates. The remainder of the abstract will appear in succeeding issues of THE JOURNAL, whereas the entire proceedings will appear in a booklet in the near future and will be available on request from the office of the Secretary of the American Medical Association.

Many failed to realize that this meeting was the centennial for one held in New York in 1853, following which there was a train wreck in which many physicians were injured and killed. The accident occurred May 6 at Norwalk, Conn. The train ran off a drawbridge into the river. In the *New York Daily Times* is a report of the tragedy and the names of physicians are frequently mentioned. How many were drowned and how many died of injuries never was determined, but a total of several score lost their lives.

At the 1853 meeting a dinner was provided by the physicians of New York City to the American Medical Association at Metropolitan Hall. The bill of fare, a photostatic copy of which was supplied to the Editor by Alfred A. Doran of New York, offered three soups, four fish, six boiled meats, eight roasts, and two cold dishes, including boned turkey and boar's head. Then followed the entrees (a choice of 16), game (a choice of 5 including grouse, red heads, broad bills,

brandt, and squabs), and 10 vegetables, pickles, and olives. Next the diner could choose from 11 pastries and confectionery, and then any one of five ices. If still plagued with an insatiable appetite for more, he could have fruit (seven varieties) and finally coffee.

The program for the 1953 annual meeting appeared in the April 11 issue of THE JOURNAL. This at best, however, can provide only a hint of the immensity and complexity of the meeting, at which nearly 49,000 physicians and guests were registered. Scientific papers, exhibits, television shows, motion pictures, radio broadcasts, fraternity meetings and alumni reunions, and activities of the House of Delegates provided a never-ending display of physicians at work and at play. For example, to consider only one phase of the social activities, there were more than 40 fraternity and alumni association luncheons and dinners.

The address of the incoming President, Dr. Edward J. McCormick, was published in THE JOURNAL, June 6. He was inaugurated on June 3, 1953, before the House of Delegates and several hundred visitors. At the same time the ceremony was transcribed for broadcasting the following evening over more than 300 stations of the American Broadcasting Company network. Another highlight of the evening was the recording of the show "Dr. Christian" featuring Jean Hersholt. Following the show Jean Hersholt was given a citation for his portrayal of the family doctor. Another activity that long will be remembered by those in attendance was the music provided by the Doctors' Symphony Orchestra of New York.

OFFICERS OF THE ASSOCIATION

Dr. Walter B. Martin of Norfolk, Va., was elected 1954-1955 president. Elected as Vice President for 1953-1954 was Carl H. Gellenthien of Valmora, N. Mex. Re-elected to office were James R. Reuling, Bayside, N. Y., Speaker of the House of Delegates, E. Vincent Askey, Los Angeles, Vice Speaker of the House, George F. Lull, Chicago, Secretary, J. J. Moore, Chicago, treasurer, Edwin S. Hamilton, Kankakee, Ill., and Gunnar Gundersen, La Crosse, Wis., members of the Board of Trustees. To fill the unexpired term of Dr. Martin, Julian P. Price, Florence, S. C., was elected.

Dr. Edward J. McCormick, Toledo, the new President of the American Medical Association, announced to the House that he had selected Dr. George A. Woodhouse, Pleasant Hill, Ohio, to membership on the Judicial Council, the 'supreme court of medicine' within the American Medical Association. Dr. Woodhouse succeeds Dr. J. B. Lukens, Louisville, Ky. Members of the Judicial Council are selected by the President of the Association.

The House voted the following to membership on standing committees of the American Medical Association:

For the Council on Scientific Assembly: Drs. Henry R. Viets, Boston, and Charles H. Pfifer, Chicago, were both re-elected to terms ending in 1958.

For the Council on Medical Education and Hospitals: Drs. Victor Johnson, Rochester, Minn., and L. S. McKittrick, Boston, were both re-elected for terms to end in 1958.

On the Council on Medical Service: Dr. Louis M. Orr, Orlando, Fla., was elected to succeed Dr. James Q. Graves, Monroe, La., and Dr. Robert B. Homan, El Paso, Texas, was elected to succeed Dr. Jesse D. Hamer, Phoenix, Ariz. Their terms run until 1958. On the Council on Constitution and Bylaws: Dr. Stanley H. Osborn, Hartford, Conn., was re-elected. His term will run until 1958.

ACTIONS OF HOUSE OF DELEGATES

The House of Delegates took important policy actions on veterans' medical care, medical ethics, osteopathy, intern training and on subjects ranging from medical education to public relations. Giving unanimous approval to a recommendation from its Reference Committee on Insurance and Medical Service, submitted as a substitute for eight different resolutions concerning the treatment of non-service-connected disabilities by the Veterans Administration, the House adopted the

policy that such treatment should be discontinued except in cases involving tuberculosis or psychiatric or neurological disorders

In taking this action the House reaffirmed and adopted the following recommendation originally presented at the Denver meeting last December by the Special Committee on Federal Medical Services

Your Committee recommends with respect to the provision of medical care and hospitalization benefits for veterans in Veterans Administration and other federal hospitals that new legislation be enacted limiting such care to the following two categories

(a) Veterans with peacetime or wartime service whose disabilities or diseases are service incurred or aggravated, and

(b) Within the limits of existing facilities to veterans with wartime service suffering from tuberculosis or psychiatric or neurological disorders of non-service connected origin, who are unable to defray the expenses of necessary hospitalization

Your Committee recommends that the provision of medical care and hospitalization in Veterans Administration hospitals for the remaining groups of veterans with non service connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community, where it rightfully belongs"

The reference committee report adopted by the House expressed complete accord with the present program of hospital and medical care for veterans with service-connected disabilities, and also included this statement

'It is the belief of your committee that the medical profession must concern itself, not with the numbers of 'chiselers' in Veterans Administration hospitals nor with the efficacy of the Veterans Administration in the administration of enabling legislation, but rather with the broad question of whether such legislation is sound, whether the federal government should continue to engage in a gigantic medical care program in competition with private medical institutions and whether the ever increasing cost of such a program is a proper burden to impose on the taxpayers of the country. A consideration of this problem must of course be predicated upon a concern for the health of the entire population and not just a particular segment"

Eleven resolutions dealing with publicity regarding unethical conduct of physicians were brought before the House as a result of recent newspaper and magazine articles reporting statements attributed to an official spokesman of an allied medical organization. The House adopted a committee report which recommended no action on the 11 resolutions but which reaffirmed the supremacy of the A M A code of ethics and urged that the Judicial Council study suggested revisions concerning methods of billing.

'The Principles of Medical Ethics as formulated, interpreted and applied by the American Medical Association must be considered the only fundamental and controlling application of ethics for the entire profession,' the reference committee report said. Any statement relating to ethical matters by other organizations within the general profession of medicine advances views of only a particular group and is without official sanction of the entire profession as represented by the American Medical Association"

Condemning generalized statements regarding the ethics of physicians, the report went on to say

"Your reference committee believes that the harm done to the public and to the profession by the current articles which lower the confidence patients have in their doctors cannot be objectively evaluated. This highlights the fact that, when individuals or groups without official status in the American Medical Association utter or publish ill-considered statements, the result too often is that the confidence of the public in the medical profession is placed in jeopardy

The reference committee believes that the members of the House of Delegates have demonstrated their devotion over the years to the principles of American democracy. This devotion includes the right of free speech. With this, the Committee agrees unqualifiedly

Broad generalizations, ill advised and poorly prepared statements that often fail to convey the intended meaning are most unfortunate and are to be deplored. Destructive critical comments serve no useful purpose. Your committee has the utmost

confidence that the great majority of our members are entirely capable of avoiding these pitfalls without additional advice from this committee"

The report also urged that the American Medical Association continue to inform its members and the public of its stand on matters pertaining to abuses and evils in the practice of medicine

The most controversial issue brought before the House at the New York meeting proved to be the question of immediate or deferred action on the report of the Committee for the Study of Relations Between Osteopathy and Medicine. The House, after two hours of vigorous, spirited debate, adopted the majority report of the Reference Committee on Miscellaneous Business, thereby postponing action until the June, 1954, meeting and allowing further study by the delegates and the state associations. The recommendations of the Committee for the Study of Relations Between Osteopathy and Medicine were as follows

'1 That the House of Delegates declare that so little of the original concept of osteopathy remains that it does not classify medicine as currently taught in schools of osteopathy as the teaching of 'cultist healing

'2 That the House of Delegates state that pursuant to the objectives and responsibilities of the American Medical Association, which are to improve the health and medical care of the American people, it is the policy of the Association to encourage improvement in the undergraduate and postgraduate education of doctors of osteopathy

3 That the House of Delegates declare that the relationship of doctors of medicine to doctors of osteopathy is a matter for determination by the state medical associations of the several states and that the state associations be requested to accept this responsibility

'4 That the Committee for the Study of Relations Between Osteopathy and Medicine or a similar committee be established as a continuing body"

A minority report of the reference committee urged approval and adoption of those recommendations at the New York meeting. The majority report, which ultimately was adopted, included the following recommendations by the Board of Trustees

'Because of the length of the report and the controversial nature of the subject, the Board feels that the House should have adequate time for its study and that the state associations should have opportunity to express their opinions

Therefore, it is recommended that the Committee be continued but that action on the report be deferred until the June, 1954, session. It is suggested that at that time the House be prepared to answer the following questions

'1 Should modern osteopathy be classified as 'cultist' healing?

'2 Since the objectives of the American Medical Association include improvement in undergraduate and postgraduate education, should doctors of medicine teach in osteopathic schools?

"3 Should the relationship of doctors of medicine to doctors of osteopathy be a matter for determination by the several state associations?"

Five resolutions came before the House with regard to the Essentials of an Approved Internship, which were adopted at the December, 1952, meeting. The Reference Committee on Medical Education and Hospitals recommended a substitute resolution that was adopted by the House after considerable discussion. The action abolishes the rule whereby approval may be withdrawn from an internship program that for two consecutive years fails to obtain at least two thirds of its slated complement of interns. The resolution also calls for further study of the essentials by a committee appointed by the Speaker of the House, at least half of whom are physicians in private practice not connected with medical schools or affiliated hospitals

Among the many other actions taken, the House reaffirmed its endorsement of the principles embodied in Senate Joint Resolution No. 1 concerning international treaties or agreements which interfere with domestic laws or rights, and it approved a resolution deploring a derogatory article about the American Medical Association that appeared recently in the

Home Life Magazine The latter resolution was referred to the Board of Trustees for implementation

Other reports considered by the House included those submitted by the Council on Medical Education and Hospitals and the Committee on Blood With more than four score resolutions to study, the House heard recommendations on subjects ranging from nursing problems to the financial support of medical education, from the status of oral (dental) surgeons to the training of medical record technicians, from gamma globulin to narcotic prescriptions, from the advertising of medical products to the portrayal of physicians in television and radio advertising, from professional liability insurance to the medical care of veterans and of their dependents, and from social security programs to the selection of interns

Without question all physicians and visitors to the 1953 annual meeting of the American Medical Association can look back with pleasure on the weather, the hospitality of the New Yorkers, the activities at the scientific and technical meetings, and the diligence of the House of Delegates Perhaps that is why so many already are planning on attending the midyear meeting that will be held in St. Louis, Dec 1-4, 1953

SCIENTIFIC EXHIBITS

The 260 scientific exhibits on the fourth floor of the Grand Central Palace were reached with the aid of a slow and crowded elevator, while many of the younger physicians took to the stairway Of all of the various meeting places the Grand Central Palace was most heavily attended The exhibits attracted thousands of physicians who were eager to learn of medical advances Their intense interest was obvious, as was the enthusiasm of the exhibitors who stood hour after hour answering questions and explaining techniques, charts, graphs, and colored illustrations More than a thousand physicians and scientists voluntarily gave their time and energy to demonstrate these exhibits for the benefit of their colleagues The main emphasis was placed on aspects of medicine of particular interest to the general practitioner Of special interest was an exhibit based on a survey of 400 general practitioners which showed the instruments and drugs deemed most essential for a doctor's bag to enable him to handle almost any emergency Among the most popular demonstrations was the special exhibit on fractures which the Association has conducted annually for the last 27 years This exhibit has become more popular in recent years, no doubt, because of the more numerous fractures caused by traffic, industrial, and home accidents Several experts simultaneously demonstrated how to reduce, splint, and apply casts to different kinds of fractures Another popular exhibit was the mechanical heart, which has already been used clinically to bypass the right or left side of the heart, thus freeing it of excessive blood while the surgeon operates within the heart The recent progress in heart surgery was demonstrated in several exhibits and was further highlighted by the award of the Distinguished Service Medal of the American Medical Association this year to Dr Alfred Blalock of Baltimore, one of the pioneers in intracardiac surgery What can be done to restore heart action in temporary stoppage during surgical operations was demonstrated manually A popular exhibit was the demonstration by the Council on Physical Medicine and Rehabilitation, in cooperation with the American National Red Cross, of the new method of artificial respiration reported on Dec 3, 1951, in *THE JOURNAL* Some 27 scientific exhibits on various aspects of the cancer problem were presented by research groups, leading clinics, and specialists from all parts of the United States The special exhibit on fresh pathology was of great interest, showing lesions in various organs which had just been removed at operations in the city and furnished by the New York Pathological Society, whose demonstrators pointed out and discussed the lesions Of special interest was the exhibit of the section on dermatology by Pomerat, Lefebvre and Smith of the University of Texas Medical Branch at Galveston, which among other things showed the chromosomes in malignant cells In his paper read on Monday in the General Scientific Meeting at the Commodore Hotel, Dr Pomerat threw on the screen a specimen containing chromosome y which enabled the surgeon to decide what kind of operation to perform in a case of hermaphroditism Dr Pomerat believed this was the first instance of this kind Each of the sections of the scientific assembly had exhibits

dealing with their particular specialty and in addition there were exhibits by small groups and individuals A committee of the Council on Scientific Assembly awarded a gold medal to Dr Oscar V Batson of the University of Pennsylvania for his exhibit on "The Anatomy of Veins" The second gold medal, the Billings Medal, awarded for excellence of correlated facts and presentation, went to Drs J Scott Butterworth, Charles A Poindexter, and C E Peterson of the New York University Postgraduate Medical School and the American Heart Association for an exhibit on the cardiac silhouette The award of other medals, certificates of merit, and honorable mention will be reported in a special section of *THE JOURNAL* next week or the following week The Council on Scientific Assembly deserves praise for another excellent program of scientific exhibits

TECHNICAL EXHIBITS

On the first three floors of the Grand Central Palace were nicely arranged 370 technical exhibits to which were assigned some 2,000 persons to answer questions about drugs, surgical and diagnostic instruments, medical books, appliances, and many other products Here the doctor could peruse as many as he liked of hundreds of new medical books and decide which, if any, he desired to purchase The same was true of hundreds of surgical instruments on display Among the precision instruments was the Blaisdell Operative Proctoscope for polyp surgery, an instrument small enough in diameter to preclude injury and large enough to allow the use of auxiliary instruments and which provided an easier method of delivering a polyp into the surgeon's grasp The improved Leitz Capillary Microscope makes simple the study of arteriolar changes and more easily seen the variations in capillary structure in the nail bed and the conjunctiva Among the new aids for the orthopedist was Zimmer's Gable-McKinney lightweight walker, which has a stair-climbing feature, an added convenience of self support and provision for sitting down to rest Shown was Baird Associates' Flame Photometer, said to be the first means devised for the instantaneous measurement of electrolytes in blood and body fluids There was a new Zeiss Colposcope for exploring the surface of the vagina to aid in diagnosing early stages of carcinomatous epithelium The Haemoscope exhibited permits a red blood cell count in a fraction of the time required by the usual method This automatic photronically operated instrument achieves a blood count in about 10 seconds after dilution The technical exhibits were in fact a "medical merchandise mart" where doctors saw a great concentration of new items, from which they could select any that might aid them in their daily work

GENERAL SCIENTIFIC AND SECTION MEETINGS

The general scientific meetings were held all day Monday and Friday forenoon in the Grand Ballroom of the Hotel Commodore, where recognized authorities presented résumés on such topics as treatment of Hodgkin's disease and the lymphosarcomas, treatment of advanced mammary cancer, atomic medicine for tomorrow's patients, treatment of the premature infant, treatment for the gastric and duodenal ulcer patient, pregnancy, lactation, growth and aging as special stress factors on nutritional processes, medical management of hypertension, adrenal insufficiency in patients who have taken cortisone prior to surgery, and tissue cultures in the service of clinical medicine It was here that Dr Pomerat showed chromosome y in a slide of a surgically removed specimen Dr Ovid O Meyer of the University of Wisconsin in his discussion considered x-ray therapy still the most effective treatment in Hodgkin's disease

The 21 sections of the scientific assembly each held separate meetings, usually in the ballrooms of the different hotels, although at times some two or three sections came together for a joint meeting The Section on Pediatrics on Thursday afternoon held a joint meeting on poliomyelitis with the Section on Physical Medicine and Rehabilitation and the Section on Preventive and Industrial Medicine and Public Health The speakers discussed differential diagnosis, epidemiological aspects of the uses of gamma globulin, future possibilities of vaccine for the control of poliomyelitis, treatment of the acute phase, and methods of preventing deformity and restoring effective muscle activity

Before the section meetings some 400 papers on clinical and experimental studies, reports of surveys, reports of new drugs and techniques were presented. While only a few of them can be mentioned briefly here, most of them will appear later in detail in *THE JOURNAL*. In the Section on General and Abdominal Surgery meeting at Town Hall, Dr Edgar J Poth of Galveston, Texas, presented an evaluation of antibiotics and sulfonamide drugs as intestinal disinfectants in the preoperative treatment of surgical conditions of the large intestine. He reported that mortality had thus been reduced about 60% during the last decade. Such drugs kill bacteria so that during operations on the bowel, bacteria do not escape into the abdominal cavity and cause peritonitis. Intestinal antiseptics, he said, has been developed to the point where it no longer increases the period of hospitalization and does not delay definitive surgical treatment. He pointed out that the use of intestinal antiseptics has reduced the number of operations necessary in large bowel surgery as well as the period of convalescence in the hospital. In his experience a combination of neomycin and sulfathalidine had proved to be the most satisfactory.

In the Section on Gastroenterology and Proctology, Drs Harry E. Bacon and Howard D. Trimpi of Philadelphia reported on 302 patients with chronic ulcerative colitis, of whom 67 underwent a total of 129 operations, with 5 deaths, 4 deaths occurring previous to 1946 following emergency ileostomies on moribund patients. In the last five years, however, it has been necessary, he said, to perform emergency ileostomies on only two patients, as all of the others came to surgery in time for whole blood transfusions and antibiotic and electrolyte administration prior to operation. Such preoperative preparation was done in cooperation with an internist in all cases and often with the opinions also of the gastroenterologist and the psychiatrist. With such cooperation, it has been possible to perform ileostomy and colectomy in one stage in the majority of patients. No deaths occurred in this latter group. Of 34 patients undergoing complete removal of the colon and using an artificial opening through the abdominal wall, 85.3%, Dr Bacon reported, were completely rehabilitated.

Before the same section Drs C. Wilmer Wirts, Martin E. Rehfuess, and Herbert A. Yantes of Philadelphia reported that corticotropin is an effective adjunct in the treatment of ulcerative colitis. They gave this drug to 40 patients who were followed up from one to two and a half years. None of these patients had surgical treatment and all but one have returned to their occupations. They had no serious reactions to the use of corticotropin, probably because of the small doses given and the short period of administration, which rarely exceeded three weeks. They do not consider this drug a cure as about half of the patients treated had a recurrence. Early relapse, however, is amenable to re-treatment with corticotropin. During the acute stage the patients received in addition to corticotropin such supportive measures as would ordinarily be given in medical management.

In the Section on General Practice at the Hotel Biltmore, Drs Evelynne G. Knouf and Albert G. Bower of Pasadena, California, presented a study of 2,967 patients with measles admitted to the Los Angeles County Hospital over a period of 12 years. A total of 215 of these cases were complicated by encephalitis and in 50 of these a series of typhoid vaccine injections by vein or muscle were given over a period varying from two weeks to four months. In all of the 50 patients on whom treatment was carried out as recommended, there was a return to the clinical normal. The authors said, "so spectacular has been a return to normal in the severe 'vegetative' cases that we must revise our thinking about the brain being permanently destroyed. No patient with encephalitis is considered hopeless, regardless of involvement, until typhoid vaccine has been given a fair trial."

In the Section on Nervous and Mental Diseases, Drs William G. Lennox and Charles H. Markham of Boston called for the elimination of discriminating laws and attitudes against epileptics which, they said, are the heritage of many centuries when there was no treatment for this disease. Thanks to the electroencephalograph and to modern drug and surgical therapy, public prejudices are fading. However, in four states epilepsy, like syphilis and smallpox, is reportable to health officers. Seventeen states prohibit the marriage of epileptics

within the child bearing age. Among the inalienable rights of the epileptic that are being curtailed by law or by public prejudice are the right to learn, to work, and to marry and bear children. They added that while some epileptics should not marry, others whose good genetic qualities more than outweigh the bad quality of epilepsy should marry and bear children. The worst social problem that concerns the epileptic is the discrimination against him in employment. Epileptics, they said, are not necessarily mentally below average. In a study of 600 patients, the average score of those of adolescent age or below was 103.7 and for the older patients 108.1 (100 being the normal average).

In the Section on Anesthesiology at the Waldorf-Astoria Hotel, Dr Harry W. Bowman of Bethlehem, Pa., presented an evaluation of dextran as a plasma volume expander based on a study of more than 500 infusions of dextran given to various types of surgical patients. This study indicated that dextran was extremely valuable in maintaining and saving the lives of such patients until whole blood could be administered. While there is as yet no substitute for whole blood, the author reported that dextran is one of the most satisfactory volume expanders available and should be used in preference to ordinary fluids or plasma, when plasma volume increase is indicated before, during, or after surgery. Dextran has proved of definite value also, he said, in the treatment of total suppression of urinary secretion by the kidney. Combinations of dextran and modified human globin were said to be of definite clinical value in the treatment of emaciated persons, in emergency fluid therapy of burns, and in promoting wound healing post-operatively. Dextran, it was said, would be of extreme value in case of a major catastrophe or in warfare. It can be stored at any temperature except freezing and is immediately available in the liquid state for intravenous administration.

Plasma volume expanders were reported on also in the Section on Military Medicine by Capt John Howard of the Surgical Research Team in Korea and Lieut Col William Crosby of the Department of Hematology, Army Medical Service Graduate School, Washington, D. C. The surgical research team in Korea has been engaged in a study of reactions to wounding and the response to resuscitation of the severely wounded. This team worked in a field laboratory attached to a surgical hospital where casualties were received on an average of three and a half hours after being wounded. They found that many seriously wounded persons can be resuscitated if plasma expanders and whole blood are administered in the ratio of one to one, a method that stretches a limited supply of whole blood. This team believes that the various plasma expanders now available leave much to be desired, but that dextran and modified gelatin promise to be useful when unlimited blood is not available. Plasma expanders can be used as the sole supporting agent during evacuation of casualties from the battle field or during surgical operations on casualties with a blood volume deficit not greater than 1,000 to 1,500 cc. In wounds of greater severity, the use of blood and plasma expanders in a ratio of one to one was useful. Other observations reported by Howard and Crosby was that a person can lose about 25% of his blood volume (about 1,200 cc) before his blood pressure falls. A loss of 40% of the blood volume (about 2,000 cc) is associated with marked decrease in blood pressure. With a loss of 10 to 20% of the blood volume, the autonomic nervous system causes vasoconstriction and increased heart rate so that normal blood pressure is maintained. Thus while the patient has lost blood he has compensated for the loss, however, it is of the greatest importance that the surgeon recognize this state and replace the blood volume deficit before any other therapy is undertaken. Anesthesia for example, converts this compensated state into one of profound shock. Simply to move such patients has a bad effect on blood pressure, especially if the posture of the patient also is changed. They observed time and again that if casualties were transferred on a litter from the receiving ward to the x-ray machine, 20 ft away, a drop in blood pressure was noted. Two such patients died suddenly and autopsy failed to demonstrate any cause of death. This sensitivity to movement emphasizes the need of adequate replacement of lost blood even in patients whose blood pressure appears to be stabilized. They said that to the old adage "splint them where they lie" we should add "transfuse them where they lie."

In the same Section, Brig Gen M S White of the Tactical Air Command and Major Robert W Merkle said that the helicopter, which has been so useful in Korea in evacuating patients from the front to surgical hospitals, can be equally important in civil life in peace time by providing medical evacuation and care in remote areas of our country. The junctional use of helicopters with airliners has possibilities of providing a means of disseminating medical science and care to all areas of the nation and in evacuating thousands of persons or in providing them with medical support in times of disaster.

Dr Daniel S Vaughan Jr of San Jose, Calif, reported before the Section on Ophthalmology that infants having feeding problems should be carefully watched for the presence of xerophthalmia. This condition, resulting from a diet low in vitamin A, if prolonged may cause softening of the cornea and possible perforation. Dr Vaughan observed two cases of xerophthalmia that were the result of antiallergenic diets.

In the Section on Internal Medicine, at the Hotel Commodore, Drs Rulon W Rawson, J E Rall and Jacob Robbins of the Sloan-Kettering Institute, New York, reported on the use of new methods to force formerly untreatable cancer of the thyroid to concentrate iodine. In 26 of 52 patients studied, it was possible to induce the cancer tissue to pick up radioactive iodine, and thus to substantially destroy the cancer tissue. Of 35 patients with widespread cancer of the thyroid treated with radioactive iodine, 51% showed improvement, as measured by partial or complete destruction of cancer lesions. They cautioned, however, against speaking of cures in such patients followed for less than 20 years, also against the use of radioactive iodine in thyroid cancer that has not spread beyond the thyroid gland and in the treatment of widespread cancer that can not be induced to concentrate sufficient quantities of the radioactive material, in the latter instance the radioactive iodine may concentrate in the blood stream and destroy both red and white blood cells and even result in death.

Dr S W Hoobler of Ann Arbor, Mich, in discussing high blood pressure before the Section on Chest Diseases at the New Yorker Hotel, said that most patients suffering from mild forms of high blood pressure need only reassurance and careful observation. However, the small minority of cases in which certain vital organs have been effected urgently need attention and in the latter group the best procedure was sympathectomy, which is effective in 30 or 40% of such patients. If sympathectomy has been found unsuccessful, Dr Hoobler mentioned certain drugs that lower the blood pressure, although all of them have some unpleasant side-effects. After uremia has developed as a result of kidney failure, none of the drugs mentioned, he said, are particularly helpful and some of them may be harmful.

In the Section on Preventive and Industrial Medicine and Public Health, Dr K C Charron, of the civilian defense health planning group in the Canadian Department of National Health and Welfare, pointed out the interdependence of the United States and Canada in the event of war. Observers in the Canadian northland, he said, might well provide the first warning of attack to both countries. We must depend, he said, in large measure on skills that our people already possess, but to these must be added a knowledge of special techniques required for disaster. He said that an effective civil defense health program cannot be developed unless individuals, groups, and the various levels of government assume responsibility and actively participate in its development, it is imperative that the lagging areas accelerate their planning to catch up to the already established units.

THE GOLF TOURNAMENT

About 170 golfers turned out for the 37th annual tournament of the American Medical Golfing Association at the Swinoy Golf Club in Bronxville. The president of the golfing association this year was Dr Thomas A Kyner of Kansas City and the chairman of the Local Committee on Arrangements Dr Joseph E Corr of New York. Dr Gerald F Derick Jr of Hackensack, N J, had the lowest gross score of 76 which entitled him to receive the president's prize, a set of clubs and the honor of having his name engraved on the Will Walter Trophy. The low net score was turned in by Dr L B Miller of Evansville Ind. Other awards

were presented during the evening banquet at the Club House. The 1954 tournament is scheduled for the Olympian Country Club in San Francisco during the next annual meeting of the American Medical Association. For the coming year the president of the golfing association is Dr Edward Campion of San Rafael, Calif, and the president-elect, Dr F O Hendrickson of Philadelphia.

TELEVISION AND RADIO PROGRAM

For the first time medical colored television was projected on two large screens, the telecasts of clinics being transmitted from New York Hospital to the Roosevelt Hotel where the screens were installed. Heretofore, these telecasts had been received on several small screens. Another innovation in this program was the presentation of a panel discussion of the diseases involved before the operations began. The diseases presented in this program were mitral stenosis, cancer of the cervix, peptic ulcer, tumor of the breast, and sinusitis. The television programs were presented for the American Medical Association by Smith, Kline, and French, a Philadelphia pharmaceutical firm, which pioneered the use of this medium in medical education.

A variety of medical motion pictures were presented daily, morning and afternoon, at the Biltmore Hotel. Often the authors themselves were present to discuss their own films. That this type of program was widely appreciated is indicated by the fact that the films were seen during the week by 6,156 persons.

MISCELLANEOUS PROGRAMS

Among other programs not officially a part of the American Medical Association program was the annual exhibit of art work by the American Physician's Art Association. Some 800 works of art, the handiwork of physicians of North America, Hawaii, and the Philippines were on display at the Plaza Art Galleries, on East 59th Street. There were landscapes, portraits, still lifes, water colors, pastels, sculpture, ceramics, photography, wood carving, jewelry, needle work, and other kinds of art. Winners in the various classes of art were announced at the banquet for this group at the Hotel Commodore Tuesday evening. The award for the best piece in the exhibit, the Helser Cup, went to Dr Jeannette Throckmorton of Des Moines, Iowa, for needle work. The President's Cup was presented to Dr M M Melicow of New York City for the best drawing and the award for the best oil painting went to Dr Richard Waldapfel of Grand Junction, Colo. Gold medals were awarded to an additional list of physician artists. The president of this group, Dr Melicow, presided at the banquet. The secretary is Dr Francis H Redewill Jr of San Francisco.

At a dinner on June 3 at the Waldorf Astoria, the Passano Award for 1953 was presented to John F Enders, Ph.D, in recognition of his development of relatively simple methods of culturing the viruses of poliomyelitis in tissue. Dr Emil Novak of Baltimore presided at this meeting. Basil O'Connor, New York, president of the National Foundation for Infantile Paralysis, gave an appraisal of the contributions of Dr Enders, and Robert S Gill, president of the Williams and Wilkins Publishing Company, presented the award to Dr Enders, whose speech of acceptance was entitled 'Some Recent Advances in the Study of Poliomyelitis.'

WOMAN'S AUXILIARY

The 30th annual meeting of the Woman's Auxiliary to the American Medical Association was held in the Grand Ball room of the Hotel Statler under the presidency of Mrs Ralph B Eusden of Long Beach, Calif. At the annual dinner of the auxiliary in the Waldorf-Astoria on Thursday evening, the guest speaker was Mrs Ivy B Priest, Treasurer of the United States, who urged women to intensify their interest in state legislatures and city councils in order to help preserve our American system and prevent the rise of an all powerful welfare state. During the meeting Mrs Eusden, the auxiliary president presented a \$10,000 check for the American Medical Education Foundation to its president, Dr Elmer L Henderson, of Louisville, Ky, making the total contribution of the auxiliary to date to the Foundation \$31,500. The new auxiliary president is Mrs Leo J Schaefer of Salina, Kan, and the next annual meeting will be in San Francisco during the annual meeting of the American Medical Association.

FEDERAL MEDICAL LEGISLATION

Detention of Narcotic Addicts

Senator Beall (R, Md) and Senator Barrett (R, Wyo) in S 994 propose to authorize the forcible detention of narcotic addicts committed by state courts to U S Public Health Service Hospitals until the addicts are cured. The bill would also require those who voluntarily submit themselves for treatment in a U S Public Health Service Hospital to take the complete treatment. States would pay the cost for persons committed by state courts. Under the present law, narcotic addicts convicted in federal courts of offenses against the United States may be forcibly detained in a U S Public Health Service Hospital until treatment is completed. However, persons who voluntarily submit themselves for treatment and persons committed by state courts cannot be detained against their will. This measure was referred to the Committee on Labor and Public Welfare.

Hospitalization for the Aged

Senator Murray (D, Mont), Senator Humphrey (D, Minn) and Senator Lehman (D, N Y) propose in S 1966 an amendment to the federal Old Age and Survivors Insurance System that would provide a system of free hospitalization with a 60-day annual limit for persons over 65 covered by Old Age and Survivors Insurance and for their dependents and survivors, to be paid for out of the OASI trust fund. Tuberculous, mental, and domiciliary care are not provided. The administrator of the social security system would prescribe regulations, and the states would merely act as agents functioning through the state health agency. The administrator of the social security system could operate the program within any state if the state failed to cooperate. Voluntary health insurance plans could be utilized as fiscal agents in providing this care through hospitals. States would be encouraged to provide, at their own expense, similar coverage for farmers and other noninsured aged persons. This bill is similar to H R 8 (Dingell) and H R 390 (Celler) previously reported, it was referred to the Finance Committee.

Medical Expense Deductions

The present income tax laws permit the deduction of medical expenses exceeding 5% of taxable income, with a limitation of \$1,250 for a single person and \$2,500 if the taxpayer has dependents. A limit of \$5,000 is set for a taxpayer and spouse with dependents filing a joint return. Congressman McDonough (R, Calif) in H R 5393 would permit "over the limit" expenses to be carried over from one year to another for three years. The bill was referred to the Ways and Means Committee. Congressman McDonough in H R 5399 also proposes to allow deduction from adjusted gross income subject to taxation of life insurance premiums under certain circumstances, but not to exceed \$200 annually. He proposes also up to \$200 deduction for hospital or any other medical care insurance. This measure was referred to the Ways and Means Committee.

Social Security Study

Congressman Reed (R, N Y) in H Res 243 would provide \$100,000 to finance a subcommittee of the House Ways and Means Committee to study the social security laws. This was referred to the Committee on House Administration and was reported favorably to the House on May 26 and was passed by the House on May 27.

Defense Department Reorganization

Congressman Hoffman (R, Mich) in H J Res 264 would make Reorganization Plan No 6 for the Department of Defense effective 10 days after the enactment of the resolution. The reorganization plan provides for six additional assistant secretaries. The resolution was referred to the Government Operations Committee.

Hill Burton Extension

Congressman Harris (D, Ark) in H R 5419 would extend the duration of the Hospital Survey and Construction Act (The Hill Burton Act) from 1955 until 1957. The bill further provides that "not more than 60 per centum of the sum allotted to a State for any year may be used for payment of the Federal share of the cost of any one or more projects in any service area if, under the State plan, there is one or more other projects in any other service area having equal or higher priority." The bill was referred to the Interstate Commerce Committee.

STATE MEDICAL LEGISLATION

Alabama

Bills Introduced.—H 311 proposes the creation of a state board of chiropractic examiners and defines chiropractic as the science and art of locating and removing without drugs or surgery any interference with the transmission and expression of nerve energy in the human body by any methods or means as taught in schools or colleges of chiropractic which are recognized by the state board of chiropractic examiners. H 395 proposes an act to provide for liens in favor of hospitals and other institutions upon causes of action for damages accruing to patients therein for the reasonable charges for hospital care necessitated by the injuries giving rise to such cause of action. S 155 proposes regulations for the awarding of 25 scholarships each year for the study of medicine in the University of Alabama Medical College. Each recipient of a scholarship under this proposal would enter into an agreement with the state board of health whereby he would practice medicine for five years after the completion of his medical training in an area or locality in the state designated by the state board of health or else forfeit and become liable immediately to the state for the amount granted him under his scholarship. S 181 proposes to provide for the licensing, regulation, supervision and inspection of private hospitals, institutions and homes for the mentally ill.

California

Bills Introduced.—A 3527 proposes regulations for the establishment of state narcotic clinics for the purposes of curbing the spread of addiction, curing addiction and obtaining information necessary to combat the narcotic menace. S 1970 proposes the creation of a state bureau of criminal identification and investigation.

Bills Enacted.—A 1739 has become ch 792 of the laws of 1953. It authorizes the governing board of a school district to contract with accredited schools and colleges of optometry, osteopathy, or medicine for the purpose of providing necessary testing of sight and hearing of pupils enrolled in the schools in the district. S J R. 32 has become res. ch 139 of the laws of 1953. It memorializes the Congress of the United States to enact legislation for the control of dangerous drugs similar to the California Dangerous Drug Act. S 1438 has become ch 773 of the laws of 1953. It provides among other things that no prescription for any dangerous drug may be refilled except upon authorization of the prescriber which may be given orally or at the time of giving the original prescription.

Connecticut

Bill Introduced.—H J R. 87 proposes to direct the legislative council to make a study of the care and treatment of habitual alcoholics afflicted with tuberculosis.

Bill Enacted.—H 1527 has become pub act No 277 of the acts of 1953. It amends the law relating to medical service corporations by authorizing the formation of nonprofit sharing corporations without capital stock for the purpose of creating a plan whereby medical service may be provided at the expense of the corporation by registered osteopathic physicians entitled to practice medicine or surgery under applicable provisions of the state law. S 301 has become public act No 254 of the acts of 1953. It eliminates existing provisions in the law prohibiting the marriage of epileptics. S 377 has become pub act No 121 of the acts of 1953. It amends the law relating to premarital blood tests by permitting the necessary examination to be made by a Canadian physician or by a commissioned medical officer in the armed forces or the Public Health Service of the United States.

Florida

Bills Introduced.—H 608 relating to the construction of a county hospital in Holmes County proposes that in the management of such hospital no discrimination shall be made against any medical doctors commonly known as M.D.s, duly licensed to practice materia medica in the state of Florida and all such regular medical doctors shall have equal privileges in treating patients in said hospital. The proposal also would require the board of trustees to organize a staff of medical doctors composed of every practicing medical doctor in the county and each such medical doctor shall hold his position on this staff so long as he complies with the rules and regulations laid down by the board. H 975 proposes to make it unlawful for any employer to require any applicant for employment to pay the cost of a medical examination or the cost of furnishing any records required by the employer as a condition of employment. H 1725 proposes the creation of a system of regional mental hospitals for the care

and treatment of mentally ill citizens of Florida H 1754 proposes the creation of liens in favor of operators of hospitals on causes of action held by patients in such hospital to the extent of services rendered to such patients. S. 597 proposes the enactment of a Florida pharmacy act. S. 916 proposes to authorize the county boards of counties of a certain size to provide for life, health, accident and hospitalization, or annuity insurance for employees of such boards and their families upon a group insurance plan S. 920 proposes regulations for the creation and operation of county hospitals in certain counties. S. 975, proposes to amend the hospital licensing law by making it applicable to all hospitals and not just those receiving federal aid or aid from the United States government.

Bills Enacted—H 138 became law without approval May 26 1953. It requires every person acting as an attending practitioner who is authorized to practice medicine, osteopathic medicine, chiropractic, naturopathy, or veterinary medicine to report immediately to the state board of health upon the diagnosis or suspicion of the existence of diseases which are communicable among humans or from animals to humans. The law also authorizes the state board of health by resolution to declare what diseases are communicable within the meaning of this act. H 340 was approved May 27, 1953. It amends the law relating to the medical examination of school children by providing that any child shall be exempt from medical or physical examination or medical or surgical treatment upon written request of the parent or guardian of such child who objects to the examination and/or treatment on religious grounds, provided that the laws, rules and regulations relating to contagious or communicable diseases and sanitary matters shall not be violated. H 854 became law without approval May 26 1953. It authorizes all counties of a certain size to expend county funds not exceeding \$5 000 annually for mental health and guidance purposes.

Hawaii

Bills Enacted—H. J. R. 26 was approved June 3 1953. It relates to the care and treatment of persons afflicted with Hansen's disease. S. 197 was approved May 28 1953. It authorizes the territory to make a charge for the use of radium applicators belonging to the territory and in control of the board of health.

Illinois

Bills Introduced—S. 525 proposes the enactment of a temporary disability benefits law. S. 530 proposes the enactment of a general hospital licensing law to cover private hospitals and sanitariums, maternity hospitals lying in homes, rest homes, nursing homes, boarding homes and other institutions providing hospitalization for in patients or nursing care for persons. S. 547 proposes the enactment of a uniform pharmacy act. S. 585 proposes to revise the law relating to the coroners by providing for the appointment in each county of a chief medical examiner to have charge of and be responsible for the investigation of certain deaths occurring in such county. Such medical examiners must be citizens of the United States, graduates of a medical school approved by the Department of Education and Registration, licensed to practice medicine in all branches in the state in which he resides and skilled in the science of pathology having had a minimum of two years formal graduate training in this specialty.

Oregon

Bills Enacted—H. 93 has become ch. 438 of the laws of 1953. It amends the law relating to the practice of massage by exempting therefrom physical therapy or massage carried on under the direction of any physician duly licensed to practice his profession in the state. H. 144 has become ch. 631 of the laws of 1953. It provides for the appropriation of funds for the establishment and maintenance of outpatient department to be operated as an instrumentality of the Oregon Fairview Home as a service to parents and guardians of mentally deficient children who are not admitted to a state institution. The outpatient department shall provide diagnostic services and advice to any parents or guardians of mentally deficient children who are not committed to a state institution and to parents or guardians of mentally deficient children who have been admitted to the Oregon Fairview Home but cannot be admitted until a vacancy occurs. H. 145 has become ch. 597 of the laws of 1953. It authorizes an appropriation of funds for the establishment and maintenance in connection with all existing and future state hospitals of outpatient clinics providing diagnostic treatment for persons suffering from mental illness or epilepsy who are not admitted to a state hospital and for persons released from a hospital without a certificate of discharge in those cases in which those persons will benefit from treatment or consultation on an outpatient basis. H. 268 has become ch. 555 of the laws of 1953. It amends the law relating to the practice of naturopathy by providing that the procuring, aiding or abetting in the procuring of an abortion shall constitute grounds for revocation of a license. The previous requirement was that it must be a criminal abortion. The act further defines an abortion as meaning the removal from the womb of a woman the product of conception at any time prior to delivery of the child. H. 270 was approved May 7 1953. It amends the law relating to the practice of chiropractic by authorizing revocation of a license to practice chiropractic by the board of chiropractic examiners upon proof that a licensee has been committed to a mental institution and upon proof that a licensee has procured or aided or abetted in procuring an abortion and upon proof of a number of other specific types of conduct by a licensee. H. 271 has become ch. 557 of the laws of 1953. It amends the law relating to naturopathy by increasing the educational requirements of applicants. It is provided that applicants must have two years satisfactory liberal arts and/or science study prior to matriculation into naturopathic college and the naturopathic school attended must be approved by the state board of

naturopathic examiners and must require for graduation a period of actual attendance of four years of at least nine months each. H. 365 was approved April 21, 1953. It amends the law relating to dangerous drugs by providing that prescriptions therefor shall be signed by a practitioner licensed by law to administer such drug. Formerly the law required such prescriptions to be signed by a physician or surgeon, dentist, or veterinarian. H. 782, has become ch. 611 of the laws of 1953. It provides an appropriation for the purpose of paying for medical, surgical, and other corrective services and facilities for children who are crippled or who are suffering from conditions which lead to crippling. S. 243 has become ch. 628 of the laws of 1953. It provides that in civil action in which paternity is a relevant fact, the court may order the mother, child and alleged father to submit to blood tests. If any party refuses to submit to such tests, the court may resolve the question of paternity against such party or enforce an order if the rights of others and the interest of justice so require. If the court finds that the conclusions of all the experts as disclosed by the evidence based upon the tests are that the alleged father is not the father of the child the question of paternity shall be resolved accordingly. If the experts disagree in their findings or conclusions the question shall be submitted upon all the evidence. If the experts conclude that the blood tests show the possibility of the alleged father's paternity admission of this evidence is within the discretion of the court, depending upon the infrequency of the blood type. S. 326 has become ch. 592 of the laws of 1953. It authorizes the board of medical examiners to institute injunction proceedings to enjoin a licensee from practicing the healing art following revocation of his license. S. 418 has become ch. 450 of the laws of 1953. It provides that a person who erects or maintains a building where any person shall administer to any woman any medicine, drug or substance whatever or shall use or employ any instrument or other means with intent thereby to destroy a child of such woman unless the same shall be necessary to preserve the life of such woman or unless such is done for the relief of a woman who appears in peril because of her pregnant condition after due consultation with a duly licensed medical or osteopathic physician or surgeon shall be guilty of maintaining a nuisance. S. 427 has become ch. 541 of the laws of 1953. It amends the law relating to chiropractic by defining chiropractic as including the performance of minor surgery and excluding the administering of prescriptions for drugs. For the purposes of this act, "minor surgery" is defined as the use of electrical or other methods for the surgical repair and care incident thereto of superficial lacerations and abrasions, benign superficial lesions and the removal of foreign bodies located in the superficial structures and the use of antiseptics and local anesthetics in connection therewith. The term "drug" is defined to mean all medicines and preparations and all substances except food and water used or intended to be used in the diagnosis, cure, treatment, mitigation, or prevention of disease or abnormalities of man which are recognized in the latest editions of the official United States Pharmacopoeia, official Homeopathic Pharmacopoeia, official National Formulary, or any supplement to any of them or otherwise established as drugs provided that nothing in this Act shall be deemed to prevent one licensed under the Act from the administration of the anesthetics or antiseptics authorized in the definition of minor surgery or the use of radiopaque substances administered by mouth or rectum necessary for roentgen diagnostic purposes provided further, that nothing in this definition shall be interpreted as authorizing the administration of any substance by the penetration of the skin or mucous membrane of the human body for a therapeutic purpose.

HOW FAR FROM A PHYSICIAN?

According to Bulletin 94A recently published by the Bureau of Medical Economic Research of the American Medical Association, approximately 509,000 square miles, or one-sixth of the entire United States, was more than a radius of 25 miles from a physician in active private practice in April, 1950. (A copy of Bulletin 94A may be obtained now, and requests may be filed for Bulletin 94, the book to be published later this year, by writing to the Bureau of Medical Economic Research, American Medical Association, 535 N. Dearborn Street, Chicago 10.) Most of this territory outside the 25 mile limit, which is shown on Map F of the bulletin, is located in the Rocky Mountain and Great Plains regions, approximately 237,000 persons, or 1/5 of 1% of the entire population of the United States, resided in these wide open spaces, where the nearest neighbor is often many miles away. The relatively small number of persons in these sections without physicians refutes most of the arguments about the unavailability of physicians services in many parts of the United States. This fact is one of many established by the joint study of medical service areas by the Bureau of Medical Economic Research and the state medical associations. This study was begun several years ago, and the book for which Bulletin 94A is a 39 map supplement will be published some time this summer. On these 61 pages of maps are 15,192 marks, one for each place in which one or more physicians are located. Even a cursory examination of these maps indicates that physicians are located almost everywhere, except in the sparsely settled sections of the West.

PROCEEDINGS OF THE NEW YORK MEETING

ABSTRACT OF PROCEEDINGS OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION AT THE ANNUAL MEETING IN NEW YORK CITY, JUNE 1-5, 1953

The actions of the House of Delegates at the New York Meeting are herewith abstracted so that the readers may have this information in digest form. The official proceedings will be made available, as in the past in a booklet, which will be sent to all members of the House of Delegates and officers of the American Medical Association by the Secretary. This booklet will not be available for several weeks.—Ed

Report of Reference Committee on Credentials

Dr William Weston Jr, Chairman, reported that 163 delegates had registered, and the Speaker announced that a quorum was present

Invocation

The Right Reverend Horace W B Donegan, Protestant Episcopal Bishop of New York, pronounced the following invocation

Almighty God, our heavenly Father, whose loving kindness is manifest in all Thy works, we give Thee thanks for all Thy gifts by which our lives are sustained and strengthened for the tasks and responsibilities that are committed to us. We ask Thy blessing upon the American Medical Association under whose auspices we are now assembled. Prosper all its undertakings, and guide and direct them in the deliberations in which they engage. We thank Thee for the work of physicians and surgeons, for the development of medical skill and knowledge, for the closer cooperation between religion and medical science. Grant to Thy servants who are called to study and practice the arts of healing the sick and the prevention of disease and pain, strength in body and soul, and bless their work that they may live as servants of Him who lived and died to save us all. We ask this in Thy name. Amen

Tellers, Sergeants at Arms, Reference Committees

Dr James R Reuling, Speaker, announced the appointment of Tellers, Sergeants at Arms, and Reference Committees, as follows

TELLERS

William R Brooksher, *Chairman* Arkansas
Vincent W Archer, Virginia
Edward P Flood, New York
E S Jones, Indiana
Carl A Lincke, Ohio

SERGEANTS AT ARMS

Laurence L Fitchett, *Master Sergeant*, Delaware
Frank J Holroyd, West Virginia
Russel V Lee, Section on Military Medicine

AMENDMENTS TO THE CONSTITUTION AND BYLAWS

John W Green, *Chairman*, California
William F Costello, New Jersey
Thomas M D Angelo, New York
Jesse D Hamer, Arizona
J Paul Jones, Alabama

BOARD OF TRUSTEES AND SECRETARY, REPORTS OF

H Russell Brown, *Chairman*, South Dakota
Clark Bailey, Kentucky
John F Burton, Oklahoma
Bernard Klein, Illinois
Raymond M McKeown, Oregon

CREDENTIALS

William Weston Jr, *Chairman*, South Carolina
Paul Baldwin, Missouri
Charles M Hamilton, Tennessee
Howard K Petry, Pennsylvania
Hoyt B Woolley, Idaho

EXECUTIVE SESSION

Grover C Penberthy, *Chairman*, Section on Surgery, General and Abdominal
George W Kosmak, New York
Fred H Muller, Illinois
John W Parsons, Maryland
Martyn A Vickers, Maine

HYGIENE AND PUBLIC HEALTH

Everett P Coleman, *Chairman*, Illinois
Earle M Chapman, Massachusetts
Willis H Huron, Michigan
Charles L Shafer, Pennsylvania
John K Glen, Texas

INDUSTRIAL HEALTH

A H Aaron, *Chairman*, New York
Lewis A Alesen, California
Charles L Farrell, Rhode Island
Charles G Hayden, Massachusetts
Millard D Hill, North Carolina

INSURANCE AND MEDICAL SERVICE

Gerald V Caughlan, *Chairman*, Iowa
George A Earl, Minnesota
Percy E Hopkins, Illinois
Louis M Orr II, Florida
Raymond L Zech, Washington

LEGISLATION AND PUBLIC RELATIONS

George S Klump, *Chairman*, Pennsylvania
Ralph A Johnson, Michigan
Thomas J Danaher, Connecticut
S J McClendon, California
Arthur C Scott Jr, Texas

MEDICAL EDUCATION AND HOSPITALS

Herbert B Wright, *Chairman*, Ohio
Gilson Colby Engel, Pennsylvania
Val H Fuchs, Louisiana
Raymond F Peterson, Montana
Hans H Reese, Section on Nervous and Mental Diseases

MEDICAL MILITARY AFFAIRS

Elmer P Weigel, *Chairman*, New Jersey
Hugh H Hussey, District of Columbia
Laurence S Nelson Sr, Kansas
W Andrew Bunten, Wyoming
Wendell C Stover, Indiana

MISCELLANEOUS BUSINESS

Walter P Anderton, *Chairman*, New York
Frank H Krusen, Section on Physical Medicine and Rehabilitation
Charles H Phifer, Illinois
George A Unfug, Colorado
Robertson Ward, California

REPORTS OF OFFICERS

Wyman D Barrett, *Chairman*, Michigan
Paul A Davis, Section on General Practice
Robert B Homan Jr, Texas
George A Woodhouse, Ohio
Charles H Richardson, Georgia

RULES AND ORDER OF BUSINESS

Hollis E Johnson, *Chairman*, Section on Diseases of the Chest

John P Culpepper, Mississippi

Peter J DiNatale, New York

George M Fister, Utah

Eugene F Hoffman, California

SECTIONS AND SECTION WORK

James P Hammond, *Chairman*, Vermont

Carl H Gellenthien, New Mexico

Karl S J Hohlen, Nebraska

Roland W Stahr, Nevada

Willard A Wright, North Dakota

Distinguished Service Award to Dr Alfred Blalock

Dr Dwight H Murray, Chairman, Board of Trustees, presented the names of three physicians selected by the Board from the list of nominations for the Distinguished Service Award, for the election of one by the House of Delegates to be the recipient of the award. The nominees were Dr Alfred Blalock, Baltimore, Dr Joseph H Pratt, Boston, and Dr Torald Sollmann, Cleveland. Dr Alfred Blalock was elected recipient of the Distinguished Service Award of the American Medical Association for 1953.

Adoption of Proceedings of Denver Clinical Meeting and of Washington Special Meeting

Dr E Vincent Askey, Vice Speaker, called for motions to adopt the minutes of the Denver Clinical Meeting, Dec 2, 5, 1952, and of the Washington Special Meeting, March 14, 1953, as printed and distributed to the members of the House of Delegates. The minutes of the Denver and Washington Meetings were adopted as published.

Remarks of the Speaker, Dr James R Reuling

The Speaker presented the following remarks which were referred to the Reference Committee on Reports of Officers.

Members of the House of Delegates of the American Medical Association

It is always a pleasure for me to appear before you, and it is with especially great pleasure that I welcome you here in New York. The county of Queens from which I come is one of the boroughs which comprise this great city. I say borough because that is what we call them here in New York City. In some parts of the country they call them counties, and in some places they call them parishes. The term borough comes from the Dutch. The borough of Manhattan where we are meeting now is sometimes erroneously thought of as being New York City. It is, however, only one of the five boroughs that make up New York City. The borough of Kings, to many better known as Brooklyn and to some best known as the home of "Dem Bums," the Brooklyn Dodgers, is located across the East River on Long Island. I said that I come from the borough of Queens. This is the largest of the five political subdivisions which make up New York City, largest in size in geographical area, and the second largest in population being exceeded only by Brooklyn. Next is the borough of the Bronx, sometimes pronounced Bronx, home of the Bronx Bombers, who play at Yankee Stadium. This is the place where the Bronx cocktail originated, and also the Bronx cheer. However, it has the distinction of being the only borough of New York City that is on the North American continent, the other four all being on islands. And lastly, there is the borough of Richmond, sometimes spoken of as Staten Island. I suggest that a ferry ride out there is well worth while, and I predict that some day it will be the most lovely of all the five boroughs, for it lies well out in the Atlantic. Forgive me for taking up your time in giving you some of the geographical background of this, the largest city in the world. We have much serious business before us.

At this time, when a voice vote is taken and the Chair is in doubt or when a division is called for, the Tellers will not be asked to make an actual count of a show of hands unless the vote is close. There was one show of hands at our last

meeting when a quick glance would have convinced anyone of the result, and in such a case the time of the House should not be consumed in making an actual count unless it is specifically requested.

The Speaker welcomes, and has received, many suggestions for the better functioning of the House of Delegates. One particular suggestion affecting every member would be such a radical change that it should be done only if the House approves. It is recommended that the reference committee study the following quoted suggestion and report to the House.

May I present to you an idea for consideration? I have had a few years' experience in the House of Delegates. It is my impression that we need more mixing up of the delegates. Might I suggest that a place card in alphabetical order be placed in front of each man's seat? Such a simple thing will mix up the delegates. It seems to me that it would be a great advantage to American Medicine if Alexen from California sat next to Allen of Georgia and next to him Abbott from New York and next to him Abrahams from Pennsylvania etc. I have found it a refreshing experience and one that increases my knowledge and tolerance to sit next to people from other parts of the country whom I know not too well. On many matters before the House the views of the delegates from Illinois, for example, might certainly be changed if each of the Illinois delegates sat next to a delegate from some other state in these United States. Our rather 'small' local view of and interest in a problem might be shown to be at fault by conversations with our brother physicians from other parts of this great United States.

Many of you are expert parliamentarians, and what I am going to say should not be interpreted as an attempt to give anyone instructions. Experience would indicate, nevertheless, that the attention of the House should be called to two motions that are frequently not clearly understood, and which are often made in error. The first of these is the motion to "lay on the table." This motion is frequently made when the obvious intent of the maker is to 'move to postpone indefinitely.' The motion to 'lay on the table' is always in order. It is a subsidiary motion of the highest rank. It is undebatable and unamendable. It should always be remembered, however, that what has been put on the table can be taken from the table with certain limitations. On the other hand, a motion to 'postpone indefinitely' may by its name be misleading. It is purely a technical term for killing the motion before the House. It is debatable. It is not subject to amendment, but it can be reconsidered.

The other motion to which your attention is called is 'the previous question.' The name of this motion is very misleading. We frequently hear members calling 'question, question.' It is only a sign of impatience, and is in a way disrespectful to the House itself or to the last person who spoke, or to the presiding officer. On the other hand, if a member rises, is recognized, and makes a motion saying "I move the previous question," such a motion must be seconded as any other motion. When such a motion is seconded, it is technically the same as a motion proposing to terminate debate or to put a stop to further discussion or to prevent further amendment on the question before the House. A vote on the "previous question" cannot be debated, nor can it be amended. It ranks, as the second highest subsidiary motion that can be made. As I said, it is not debatable and it cannot be amended. However, it can be reconsidered. But, most important, it requires a two-thirds vote for adoption. The reason it requires a two-thirds vote is that if adopted, it deprives the members of the right of further discussion. Particular attention is called to the fact that the adoption by a two-thirds vote of the 'previous question' does not constitute a vote on the main motion before the House or on any amendment to the main motion which has been made. It is only a motion to terminate debate. After it is adopted, the House must then vote on any amendment or substitute motion, and then on the main motion, as in usual procedures.

Several innovations have been made which should make your work easier. Whether Dr Lull, Dr Howard, or your Speaker, or the combination of the three is responsible, is immaterial. There was even an editorial in *Northwest Medicine* regarding one of these innovations. In a folder which will be provided to you, you will find reports and resolutions that have been submitted in advance. Also, you will find two lists of references of the material in your handbook. One of these sheets contains references by consecutive pages in the hand-

book. The other list is made up of subjects or pages referred to individual reference committees. In other words, the two lists will constitute a cross index for your convenience.

As we have done in the past, it is again requested that you omit all "whereases" in the presentation of resolutions, for it does conserve much time. Before the meeting of the House at which reports of the reference committees are made, you will find at your place complete mimeographed copies of resolutions, including the "whereases," which have been presented and on which the reference committees will report. If there are many resolutions presented dealing with a single subject, all will not be multigraphed, but only one or two specimens will be given you. It is believed that in this way you will have before you complete information on all questions on which you are asked to make your decisions and cast your votes. It is believed that this innovation will expedite the work of the House in that there will be less frequent requests for a re-reading of material previously submitted. It may be that a few delegates may not have done their home work" or may have left their folders some place. If there are requests for re-reading of resolutions of material previously submitted, it will not be done unless the House so orders.

At the risk of repetition, attention is directed to a recommendation made by the Speaker at the Denver meeting. From my remarks to you regarding the preparation of reference committee reports, I shall quote, "There may be times or circumstances when a reference committee cannot reach a unanimous opinion. Under such circumstances, it is perfectly proper that two members, or even one member of a reference committee, bring in a minority report. If there is a minority report it should be as carefully prepared as the majority report."

Believing that the majority of delegates are interested in starting their meetings on time and at the appointed time, the Sergeants at Arms are requested to station themselves in the corridor and in the rear of the meeting room at least five minutes before a session starts in order to urge and alert delegates to be seated promptly and without too much confusion. At the annual meeting when elections take place and in order to expedite the counting of the ballot, it is recommended that the House approve the appointment of eight Clerks from the House to work under the Chief Teller and assist the Tellers in making the actual count of the ballots.

Your particular attention is called to a booklet entitled "Your Role as a Delegate to the American Medical Association," which was sent to you with your handbook. If you have not already read this, I would ask that you give it careful consideration, as it contains much useful information regarding the House of Delegates and procedures that have been adopted.

Attendance slips are handed out by the page boys stationed at the door as you enter the meeting room. It is necessary that you sign these attendance slips if you expect your name to appear in the official published proceedings. This is the only method by which the headquarters office can check on the members present at a session, and you are therefore urged not to put the slip in your pocket, but to sign it and return it to the page boy.

In past years at the time of the Annual Meeting it has been customary to read the names of former officers and members of the House of Delegates who have been called to their reward by the Great Healer. There may be many instances when present members of the House have been unaware of our loss and would wish to write some word of condolence to the family. Lists of the former members now deceased have been mimeographed for distribution among you, and instead of reading the list at this time, I would suggest that you give it careful and reverent consideration individually. At this time we shall rise in silent tribute to these departed confreres.

Members of House of Delegates and/or Officers of the American Medical Association Notice of Whose Death Has Been Received Since the 1952 Annual Meeting

(The dates following the names indicate years of service in the House or as Officers of the Association.)

Adams, Bon O, California, 1940
 Alley, John Newton, Idaho, 1913
 Aranow, Harry, New York, 1946-1948
 Armstrong, Guy L, Illinois, 1914-1915
 Baysinger, Stuart L, Missouri, 1920-1921, 1928-1932
 Burton, Paul H, North Dakota, 1934
 Codman, Charles A E, Pennsylvania, 1940
 Cooper, O O, West Virginia, 1908
 Coventry, William A, Minnesota, 1914, 1916, 1937-1950
 Craig, Robert R, Nevada, 1916
 Cullen, Thomas S, Maryland, 1903 1913-1914, 1916, 1918-1920, 1922, 1924-1925, 1942, 1945-1947 Member Board of Trustees, 1929-1941
 Deaf, Don W, Illinois, 1917-1918
 Ireland, Merritte W, U S Army, 1908-1910
 Lytle, Franklin Pierce, Pennsylvania, 1925, 1928, 1930-1931, 1933-1940
 Miller, Richard H, Massachusetts, 1935 1938, 1941-1944
 Moody, Earle F, Alabama, 1916 1917
 Moore, Robert M, Indiana, 1931
 Mowry, Jesse E, Rhode Island 1916-1917
 Plummer, Samuel C, Illinois, 1904
 Reeder, Frank E, Michigan, 1939-1947
 Seeger, Stanley J, Milwaukee, Wis, Vice President, 1944-1945
 Shanks, Edgar D, Georgia, 1946
 Skinner, Edward H, Missouri, 1928, 1935, 1937-1944
 Tolleson, William A, Oklahoma, 1914
 West, Olin, Nashville, Tenn, Field Secretary, 1922, Secretary, 1922-1946, President-Elect, 1946-1947, General Manager, 1924-1946
 Wilkinson, Charles E, Illinois, 1935, 1937-1945
 Yeager, George C, Philadelphia, Vice President, 1931-1932

Report of Reference Committee on Reports of Officers

Dr George A Woodhouse, Ohio, presented for Dr Wyman D Barrett, Chairman, the following report, which was adopted.

Your committee wishes to commend the Speaker for his historical and geographical review of the largest city in the world, namely New York City. His interpretation of the procedure of the House of Delegates, with the various resolutions and questions that arise, was well described and very informative, and we hope that each member of the House of Delegates will acquaint himself with these parliamentary procedures and methods of voting on matters under discussion.

It had been suggested to the Speaker that mixing of the delegates from the various states would be advantageous to each member in becoming acquainted with men from other states and sections. Your committee is of the opinion that such a procedure in seating delegates should not be a hard and fast rule, but that an attempt should be made to give it a trial at succeeding sessions, and that the Speaker could give consideration to making arrangements for carrying out this suggestion.

In order to provide the delegates with complete copies of all resolutions and reports to be available at the first session of the House of Delegates as suggested by the Speaker, it is recommended that whenever possible all resolutions should be sent to the headquarters in Chicago in advance of the session so that an adequate number of mimeographed copies will be available at the first session of the House of Delegates.

The Council on Constitution and Bylaws presented a suggested revision in order to provide the procedure of a minority report being presented from a reference committee, should this be necessary.

The booklet entitled, "Your Role as a Delegate to the American Medical Association," which was mailed to all delegates prior to this meeting, contains excellent factual information for the guidance of the House of Delegates. Your committee suggests that this booklet should be mailed to each delegate at succeeding sessions of the House. The recommendation of the Speaker that the House approve the appointment of eight Clerks from the House to work under the Chief Teller is an excellent suggestion and should be carried out.

The publication of lists of deceased former officers and members of the House of Delegates, as printed this year, should be continued

Address of the President, Dr Louis H Bauer

Dr Louis H Bauer, President, presented the following address, which was referred to the Reference Committee on Reports of Officers

Mr Speaker and Members of the House of Delegates

Except for a few brief remarks tomorrow night, this is my final formal talk to you as President Two years ago when you elected me to this high office, I said I hoped that when my term was up, you would have no regrets for your action

It falls to the lot of but few persons to be president of the greatest medical association in the world It is not an easy task, and I believe it becomes a more difficult one each year It is not the travel, the speeches, the meetings, nor even the correspondence, and they are all somewhat backbreaking, that make the position difficult It is the fact that in the eyes of the public, and even in the eyes of the majority of the profession, the President represents the Association Every word he utters is analyzed and often twisted as to its meaning Every speech he makes, every quotation from his remarks, results in a deluge of letters, some praising him for his stand, others condemning him He soon learns that he cannot please everyone He has to hear the Association attacked and blamed for things for which it is in no way responsible His own motives may be questioned He becomes shocked at the appalling ignorance that many doctors have about their own association

During the past two years I have personally answered nearly 2,000 letters They were of all types Some were congratulatory, some were interrogative, some were critical of the actions of certain doctors, some were critical of the American Medical Association, particularly with reference to the 'Doctor-Draft Law,' and some were critical of public statements I have made, usually because of quotations out of context but sometimes because of honest differences of opinion There even have been a few from inmates of mental hospitals asking me to get them out.

All this is part of the job, and one should not accept the position unless he is willing to shoulder the tremendous task and struggle to do the best he can as he honestly sees it for the best interests of American medicine and the American public He, being human, will make mistakes, but if he is to be of any use to the Association, he cannot idly sit back and do nothing because he fears criticism This is a free country, and everyone is entitled to his opinion, and I believe doctors as a class are more individualistic in their thinking than any other group of persons

I respect the man who holds a different opinion from mine and who fights honestly and fairly for that opinion Constructive criticism and honest differences of opinion are always welcome They make for progress I must admit, however, that it was rather discouraging, after twenty years of fighting for organized medicine and against socialism, to receive two letters and a copy of a statement of undetermined distribution, accusing me of duplicity, untruth, perfidy, and being a party to a craven episode The whole Board of Trustees and certain personages high in government were also viciously attacked, but most of the vitriol was thrown at me I mention the incident only to indicate that the path of the President is not strewn with roses

This all pertains, of course, to the recent actions of the Board of Trustees and the House of Delegates supporting the elevation of the Federal Security Agency to the level of an Executive Department A great deal of misunderstanding is current, and it is due to a great deal of misinformation being bandied about

I have been accused of being scarcely truthful in saying the information could not have been sent out earlier The facts are as follows It was February 18 when it became definitely apparent that a reorganization plan would be introduced, and only the barest outlines were known It was decided, however, that the House ought to pass on it As it takes twenty days to call a meeting of the House, a call was sent out at

once On February 25, plans were more definite and the general scheme was known, but the bill had not been drafted, however, everything that was known was incorporated in a letter sent to every delegate The actual texts of the bill, of the President's message, and of the directive describing the duties of the special assistant for medical affairs were not received until about thirty six hours before the House convened

The Board could have done any of four things It could have done nothing, or it could have approved the proposition, either of which would have been contrary to the House's previously expressed desires It could have opposed the bill, but, as there were certain differences in the proposed bill from previous bills, the Board took the fourth alternative, that of submitting the matter to the House, as the only fair thing to do

It has been alleged that the plan was no different from the ones submitted previously That is not true In no previous bill was there provision for a special assistant through whom medical affairs would be screened It is stated that this position is advisory That was known, and it was so stated, but what positions in the government outside of cabinet posts are not advisory? Even cabinet officers are advisory to the President

There have been statements that by our action we have approved extension and expansion of Social Security We have done no such thing Social Security has not been changed, and there is every probability that no change will be made until after a thorough investigation and reevaluation of it This certainly should be done

It has been stated that we would have been better off with an assistant secretary rather than with a special assistant to the secretary I do not agree An assistant secretary would have had something to say about health matters only within his own division The special assistant can render opinions on any health matter arising within the department, in health agencies, education, or Social Security Furthermore, we have reserved the right to recommend changes in the law as indicated even to the point of asking for an independent department of health, if it seems advisable

The House has on several occasions asked for the latter, even as recently as December, 1952 We have been accused of opening the door to government control of medicine by approving the present plan In my opinion the present plan is far less dangerous An independent department of health could well prove to be the dragon that would devour us There is far less danger in the present setup

No doctor could fail to be both humbled and somewhat awed by the honor of being President of the American Medical Association I venture to say, however, that no President has ever been sorry that his term was over, except to regret that he could not have accomplished more

In my acceptance speech two years ago, in my inaugural speech a year ago, and in my presidential pages in THE JOURNAL, I have outlined some of the things that I think we should do How far have we progressed during the past year?

Voluntary insurance has continued to make great strides One of the gaps in its coverage that I mentioned is protection of those over age 65 This is rapidly being accomplished, and before long I believe it will be accomplished The other gap, namely protection against long-duration illness has proceeded more slowly and is not yet sufficiently available It must be made so

Programs for the medical care of the indigent are steadily progressing and must be made available in all areas Programs for the care of those suffering from chronic and degenerative disease have not progressed very far during the past year and probably will not until the Commission on Chronic Illness makes its report This problem must be placed high on our agenda Public health coverage is steadily improving, but some areas still lack satisfactory programs Little further progress can be expected in this area until Congress has investigated and decided on the whole grant in aid problem Public health is primarily a community responsibility The emergency call system is steadily increasing, but in some

areas there has developed an apathy among doctors with regard to it. Doctors must be stimulated to accept their responsibility of making medical care available at all hours of day or night.

Much has been said in various quarters about excessive fees, fee splitting, and ghost surgery. While I would not be little these evils, it is unfortunate that the impression has reached the public that these things are common among the profession. They do exist, and they must be stamped out, but the vast majority of the members of the medical profession are honest and above reproach in their financial relations with the public. The whole profession should not be tarred with the same stick that should be applied to a few. These evils can be eliminated by grievance or mediation committees made up of members with steel in their backbones, and the county societies must support the actions of their committees. These committees must never become "whitewash" agencies. Whenever possible the members of these committees should be drawn from areas other than those in which the defendant lives.

This brings me to the subject of ethics. Too little attention has been paid to teaching the ethics and traditions of medicine to the younger generation of doctors. I am glad to say that societies in many areas are waking up to this and are establishing courses of instruction for prospective members. This should become a universal practice. Medicine will probably continue to be one of the learned professions. In the past, however, the family doctor has been closer to the individual and the home than anyone else with the possible exception of the clergyman. This relationship and high status of the profession will be lost unless we inculcate the ideals and ethics of medicine on the new members of the profession. The new doctor must realize that medicine is primarily a public service and that there are certain things an ethical physician just does not do.

Last December I urged the appointment of a committee to meet with representatives of the Advisory Board of Medical Specialties to see what could be done to increase the flow of general practitioners and decrease the flow of specialists. I hope, earnestly, that something will come out of these conferences. I believe the freedom of medicine as we know it will depend largely on the results they obtain. The American Medical Education Foundation is receiving steadily an increasing amount of funds. The President of the United States has stated that he is against federal support of education, and I believe that statement comes from his heart. Nevertheless, funds must be obtained for the support of medical education. Should the federal government enter this field there would be a danger of government control of education, and, in addition, private funds now received would dry up. Then, should the government withdraw or reduce its financial support, our schools would be worse off than ever. Every doctor owes something to his medical school. The tuition he paid represented not more than one third of the cost of his school in educating him. The balance came out of endowments. Endowments are not increasing, and interest on them has shrunk. Now is the opportunity for the doctor to repay his debt to his school. The American Medical Association for three years has contributed a half million dollars each year to prime this project. It cannot continue this indefinitely. The doctors themselves must step into the breach.

In my over 100,000 miles of travel this past year and in the 50,000 miles traveled last year I have been shocked to find how many members of the American Medical Association know little or nothing about their own organization. During the last few months I have spent most of the time in my various talks telling what the American Medical Association is and what it does for the public and for its members. Never yet has it failed to happen that a number of men would come up to me afterward and say they had had no idea about the things I had told them. It was also rather shocking to find that doctors in other countries know more about the American Medical Association than many American doctors. In several countries I have visited, the doctors told me they would like to pattern their associations after the American Medical Association.

I think perhaps the Association made the greatest mistake in its existence when it did not impose dues from the very beginning. One never appreciates what he gets for nothing. After a while he takes it for granted and forgets who pro-

vided it for him. The whole environment of medical practice in this country today is due to the Association. The fact that our medical schools are unexcelled in the world today, the fact that the doctor can turn to our various councils, Pharmacy and Chemistry, Foods and Nutrition, and Physical Medicine and Rehabilitation, for reliable information about drugs, other therapeutic agents, diagnostic and therapeutic apparatus and methods, is a privilege not enjoyed by doctors in any other country. Our Council on Industrial Health and the Council on Rural Health have done much to raise health standards in those fields. Our Bureau of Investigation has shown up a half a million quacks, charlatans, and fraudulent remedies. Our medical publications, scientific exhibits, and meetings are a postgraduate course of instruction in themselves. Some of our journals are published at a loss as a service to the profession. The Committee on Research has contributed largely to our knowledge. Research students could not function without our Quarterly Cumulative Index Medicus, which is also published at a great loss. The Bureau of Health Education is serving the public as is no other health information service. The Council on Medical Service, with the Bureau of Medical Economic Research, are constantly pouring out information on the social and economic aspects of medicine. Where would our members get the information they have available on legislation, federal and state and on court decisions affecting medicine, were it not for our Washington Office and the Bureau of Legal Medicine and Legislation? So I could go on, and most doctors do not know these things, or, if they do, they take them for granted. In the last six years I have visited twenty two foreign countries, some of them several times. I can assure you that no medical association in the world has done so much for the people of their countries or for their doctors as has the American Medical Association. It is high time that these facts were universally known. Our Public Relations Department, under Leo Brown, has done much in the last two years to publicize these facts, but he and his department need the help of every one of you to spread this knowledge. Our members need not only to be educated, but to be stimulated to take part in the activities of their local and state organizations. The time has long since passed when a doctor can concern himself only with scientific medicine. He must be alert to the social and economic phases as well.

The lack of knowledge that doctors exhibit was never more forcibly brought to my attention than with the enactment and operation of the Doctor Draft law. Every injustice resulting from that has been blamed on the American Medical Association. Every doctor who has been dissatisfied with his service, everyone who has experienced any injustice in his being called up or in his service—and there have been many—blame it all on the Association. They have absolutely no idea what has been done by our Council on National Emergency Medical Service to better their lot, no idea of the recommendations the American Medical Association made that were disregarded. It reminds me of a story about Dr. John Collins Warren of Boston. In the early 1890's he operated on a woman for a vesicovaginal fistula. Up to that time the operation had never been successful. This operation was, and he was very much pleased. He visited the patient one morning and said, "Well, Mrs. X, how do you feel this morning?" "Oh doctor," she replied, "Thank God I am like other women now." "That's right," said Dr. Warren, "If anything goes right, thank God for it, and if it goes wrong, blame the doctor!" So it is in medicine, if anything goes right, I do not know whether the doctors thank God for it or just take it for granted, but I do know that if anything goes wrong they blame the American Medical Association.

During the past year a new administration came into power. We felt that the danger of socialization was over. Some have become impatient and expected overnight miracles. I should like to remind them that "the mills of God grind slowly, yet they grind exceedingly small." A snowball rolling downhill increases in size and momentum. The socialistic snowball has not been rolled back uphill, but the momentum has been stopped and cuts have been made in its size. The President of the United States told this House of Delegates last March that he disliked two words, "compulsory" and "socialized." I am certain that while he is in the White House

we need have no fear of medicine being dominated by a socialist minded bureaucrat. We must, however, work constantly to eradicate the gaps in our medical care system, which I have enumerated so that there will never again be any concerted effort to destroy freedom in medicine.

I bespeak for Dr McCormick, my successor, your wholehearted support and cooperation. To him I extend my congratulations and best wishes.

In closing I wish to thank you for the honor you have conferred upon me and to express my appreciation for the support you have given me. Two years ago I promised to give you the best there was in me. I have striven to do that, but, compared to what remains to be done, it has seemed pitifully little. I shall retire from this office with one regret—that I have not been able to do more.

The aim of medicine and the American Medical Association is one and the same—to bring increasingly improved medical care within the reach of every citizen. I assure you that as long as I am physically able I shall, as a private in the rear rank, continue to work for the attainment of that aim. Thank you!

Report of Reference Committee on Reports of Officers

Dr George A. Woodhouse, Ohio, presented for Dr Wyman D. Barrett, Chairman, the following report, which was adopted:

Dr Louis H. Bauer, in his last address to the House of Delegates as President, virtually gave an account of the work he had done during the past year. The amount of work accomplished and the distances traveled seem almost a physical impossibility for one individual. In this address Dr Bauer commented on various pertinent activities which the Committee wishes to point out to the House of Delegates.

The special meeting of the House of Delegates held in Washington in March of this year, at which time approval was given to the establishment of a Department of Health, Education, and Welfare, was discussed by Dr Bauer. He explained the necessity for calling the House in special session to take action on this proposal in order to obtain the concerted opinion of the representatives of the medical profession of the United States regarding the proposed Reorganization Plan. Your committee regrets that Dr Bauer has been attacked by many in the profession because they were unaware of the facts. These, we think, have been clearly explained in his address.

Dr Bauer referred to the continued expansion of voluntary insurance plans during the past year. In addition he pointed out the necessity for providing programs for the medical care of the indigent and those suffering from chronic and degenerative diseases. Your committee agrees that immediate further intensive study of these problems should be made by the various commissions, committees, and councils that have this matter under consideration. Without a doubt, definite plans and procedures for the alleviation of some of these problems will be promulgated by the Commission on Chronic Illness when its report is completed.

It is unfortunate that the whole profession has been criticized for the acts of the very few unethical and irresponsible individuals. Your committee agrees with Dr Bauer that the questions he has mentioned with regard to these unethical procedures are occurrences that should be stamped out completely. It is also unfortunate that an occasional member of this honored profession will, in the public press, make statements that are interpreted by the public as involving the whole profession when these conditions are minimal. More attention should be paid to the teaching of the ethics and traditions of medicine in the medical schools of our country. This program should also be one for major discussion in the local county medical societies, not only for the education of the new doctor but also for the older physicians.

Your committee is pleased that the President of the United States has stated he is against the federal support of education and that he dislikes two words "compulsory" and "socialized." One of the answers to this problem is continued support of the American Medical Education Foundation.

The problem of too many specialists and not enough general practitioners is one that is nationwide and while this can

be directed by an advisory board at the top level, many of these problems should be solved at the local and state level.

Your committee was impressed by the President having traveled some 150,000 miles during the past two years, and talking to various groups and organizations concerning the activities of the American Medical Association. This widespread travel has carried him not only through the United States but to several foreign countries.

Dr Bauer delineated the various headquarter activities of the association in its councils and bureaus and pointed out that their function was frequently more valuable to the general public health than to individual members of the Association. The services of the American Medical Association to the American public have been given by a purely voluntary organization without federal tax support. The public relations activities of the Association have been conducted on a high level, and its activities have been widespread in educating not only the general public but the medical profession concerning our organizational functions.

There has been much widespread discussion, due primarily to misinformation, concerning the enactment and operation of the Doctor Draft law. Dr Bauer commented on this fact and stated that many of the recommendations of the Council on Medical Service had not been accepted by the Department of Defense.

Finally, your committee wishes to commend Dr Bauer for his year's period of service and his diplomatic conduct of the office of President, and for his untiring efforts in behalf of the public and the medical profession.

Presentation of Distinguished Guests

The Speaker announced that Dr Leo Schiff, Chairman of the Committee on Foreign Guests, and Dr George W. Kosmak, Chairman of the Local Committee on Arrangements Subcommittee on Distinguished Guests, had brought to the rostrum a number of distinguished American and foreign guests. The visitors were introduced to the House of Delegates by the Speaker and presented greetings from the organizations or countries they represented, as follows:

Dr Morris Hinenburg, American Association of Hospital Consultants

Sir Alexander Fleming, British Medical Association

Dr J. G. Hunter, British Medical Association in Australia

Dr W. C. Atkinson, National Medical Association

Dr Percy T. Phillips, American Dental Association

Mrs. Ralph B. Eusden, Woman's Auxiliary to the American Medical Association

Mrs. Elizabeth K. Porter, American Nurses Association

Brig. Gen. J. A. McCallam, American Veterinary Medical Association

Dr T. C. Routley, Canadian Medical Association

Mr R. Q. Richards, American Pharmaceutical Association

Dr Albert W. Snoke, American Hospital Association

Drs. Guillermo Garcia Lopez, Julio F. Schutte, and Juan J. Mestre, Republic of Cuba

Drs. Norman R. Booher and H. D. Shapiro, American Legion

The Speaker read a telegram of greetings and regret that he could not be present in person from Dr. Wilton L. Halverson, President of the American Public Health Association.

Address of Dr. Howard A. Rusk

Dr. Howard A. Rusk, of the Rehabilitation Mission to Korea for the American Korean Foundation, was introduced by the Speaker and presented the following address:

Mr. Speaker, Mr. President, Members of the House of Delegates, Ladies and Gentlemen: I am here this morning as a substitute for a distinguished colleague, and I shall read his letter, it is dated May 29 from the Korean Embassy in Washington.

I was deeply touched by the invitation of the House of Delegates of the American Medical Association to address them at their annual meeting in New York. As a practicing physician for 28 years to have my profession understand the plight of my people means more to me than you will ever know. I hope that you, having been in Korea, can tell the story.

to our colleagues and express to them my deep regret at not being able to be with them personally as pressing problems in Korea today make it imperative for me to be in Washington. May God bless you all

Sincerely yours
You CHAN YANG Ambassador

It is really presumptuous for me to speak about the problems in Korea. Many of you have been there and seen them personally. Many have spent much more time there than I. The only reason that I have to stand here is that the mission I have just returned from was a little different from the ordinary mission. I went representing the American Korean Foundation which is headed by Dr. Milton Eisenhower, with a distinguished Board of Trustees, to study the health problems and social problems of the Korean civilian. Many hundreds of missions have been there for the military, but this was a civilian mission, and I would like to tell you in these few minutes something about these problems of our brave allies.

First I should like to set the climate. It is very difficult to tell you what Korea is like in this Grand Ball Room at the Waldorf, so come with me on the first week in March to Seoul. It is 15 above zero and sleet. The room is filled with the stench of night soil that you can't get out of your nose, and there is dust that, when the sleet stops and the sun comes out, comes into every crack and gets on your papers and in your skin. Your water to wash with this morning was carried in a bucket from the East River, and your breakfast was a handful of rice. You are cold and hungry. There are 19 million people in South Korea, nine million refugees, two million still on the march. There are 300,000 widows, and that is a particularly difficult problem because, according to the mores of the country, the widows do not remarry. There are 100,000 orphans in so-called orphanages. We stop at the first in Seoul, a Buddhist monastery on a hill. There are 300 children singing at the top of their lungs. Half of them are barefooted, and they are singing Korean songs, and O Susanna, Don't You Cry for Me, I'm Going to Alabama With My Banjo on My Knee. The second orphanage is run by a man who felt sorry for children. He has a hundred. They are sick, and they are deaf, and they are feeble minded, and they are crippled. They are under a roof, and that's all. They have two hops of rice a day, and that is their diet.

I believe I could tell you the story best medically if I could get you to visualize a town of 25,000—White Plains, New York, Alton, Illinois, any place about the country of that size. The plumbing is out. One fourth of the houses are destroyed. One-fourth are in ruins. There is no water supply except what you carry. In that town, there are 1,400 patients with tuberculosis. Five hundred of them are actively ill. Ninety per cent of the population has intestinal parasites. They are all cold and all hungry, and you are the one doctor to meet the need. There are 815 doctors, not trained by our standards, but graduates of the Japanese schools, responsible for 19 million civilians, and that is 1 to 25,000. There are 55,000 cases of leprosy in Korea. Public health is the best of all the government agencies, because, at the end of the war, General Steve Simmons brought twelve young Korean physicians over here, and, under Rockefeller fellowships, they trained in public health at Hopkins, Michigan and Harvard. With them and UNIPAC, Korean medical police, they have controlled to more than 95 per cent typhoid, smallpox, typhus and malaria.

I would like to say a word about the Korean people. It has been said they are the Irish of the Orient. To have a people that are hungry and that are meeting the needs of 80 per cent of the front lines and fighting next to troops who have meat three times a day and steak three times a week, and all the ice cream they can eat, and to be on 3,200 calories with rice and a side dish, which is usually cabbage or Korean turnips, and meat or fish twice a month and still love the man that you fight next to, and still keep your sense of humor, shows the heart of those people. I said to one Korean, 'They tell me you Koreans are the Irish of the Orient,' and his response was, 'Whoever told you that is wrong. The Irish are the Koreans of Europe. To me, they

are a cross between the Greeks and the Israelis and the Finns and the Irish put together, with the American spirit added. General Ryan, General Taylor or anyone there will tell you that there is no greater fighting man in the world today than the Korean General Pack, the Commanding General who was here in New York last week, is 32 years old, four stars, and he held Seoul in the early days. He said, 'Early days they say Korean coward, he run Korean have five days' training when he go to front line. He never see tank. He never see artillery. Korean trained today. He no run.'

I think that I have never been as proud in my life to be an American doctor as I was in Korea, not only because of the greatest record of all time in the care of the troops and the care of the wounded, but there isn't a doctor on duty there who is not teaching in one of the medical schools, who is not working in an orphanage or a children's clinic or some place after hours, because he is an American doctor and because he feels for these people. In going through provincial hospital after provincial hospital, I found patients on the floor on blankets, perhaps one or two doctors, and doctors and nurses working 16 hours a day, seven days a week, and going home for their meals. I never heard a child cry or a patient groan in pain or saw a patient vomit who was not receiving attention. I never heard a Korean say but one thing, 'If you will help us off our knees, we will take care of ourselves and we will fight to the last man to defend our country for freedom and against Communism, but we have to build our fertilizing plants and we have to get our fisheries going to stand on our own feet.' I believe that we shall never be able to give anything to Korea. I think that anything that we send will only be a small token payment on the debt that we owe to the people of this country who, after 50 years of Japanese domination and five years of freedom, accepted the torch to defend themselves against Communism. I think that we in medicine have a particular role and a particular opportunity, because it is our job to bind the wounds of war and bind the wounds of a country when it comes to making the peace.

There are six medical schools in Korea, and only two are just opening. There are no books, there is no equipment, there is nothing but a desire to learn. Through the cooperation of General Armstrong, books and magazines and equipment, anything that you may have, can be shipped to Kormed, Alameda Army Depot, Alameda, California, and it will be shipped on to our colleagues in Korea. Through the efforts and understanding of your President, our President, the World Medical Association has taken the Korean medical profession under its wing, and already the pharmaceutical houses, through the World Medical Association and through our own American Korean Foundation, has shipped more than 20 tons of drugs to Korea, and they are making all of their publications available in quantity for every Korean doctor.

Next week, the President has proclaimed Korean Week, and every governor in every state has proclaimed it in his state, so that we in America can show the people in Korea how we feel about them as person to person. We have to do as much as the GI has done. He started calling them Goofs, and now he calls them Buddies. As one boy said to me in a hospital, 'I have told my family not to send me any more food packages, but to send me something for the families of my Korean friends.' I think that we in medicine in America should send the message to our colleagues in Korea that we are with them, that we want to help them. It will mean much, for once this war is over, I think at long last in Korea we will have a chance to win the peace, and we in medicine have a great opportunity and a great privilege to take part in such winning.

Presentation and Addresses of Student A M A Delegates

Mr. Russell F. Staudacher, Executive Secretary, Student American Medical Association, escorted to the rostrum Mr. Charles J. McGaff and Mr. Joseph E. Mason, delegates of the Student organization to the House of Delegates. The Speaker introduced Mr. McGaff, who addressed the House as follows:

Mr Speaker Mr President Members of the House of Delegates and Friends The Student American Medical Association appreciates as always, the privilege of attending your meeting of the House of Delegates. We also appreciate this opportunity to tell you that the young association which you so generously helped into being less than three years ago now has 64 chapters in the nation's 79 medical schools, and we represent now more than 16,000 dues-paying members. The Student American Medical Association's financial picture has also brightened with our other successes, and as of the end of our fiscal year, June 30, 1953, we will have sufficient assets to repay all of the obligations and loans incurred during these first years. However, rather than deplete our treasury, the Executive Council of the Student American Medical Association has decided to repay our obligations in installments. Therefore, it gives me great pleasure to present this check for \$10,000 to the American Medical Association in partial payment for the generous assistance it has so freely given our fast growing organization. Thank you very much!

Mr Joseph E. Mason was introduced by the Speaker and offered the following remarks:

Mr Speaker I am very happy to be here and feel most privileged to have the opportunity to represent the Student American Medical Association at this convention. In turn, I would like to invite you to attend our national convention to be held in Chicago on June 15, 16, and 17 at the Edgewater Beach Hotel. We only hope that we can show you just a fraction of the hospitality, friendliness and cooperation which has been tendered us since our arrival here. May I also add that Mr McGaff and myself will be most happy to discuss any of the numerous functions of the Student American Medical Association with you. In closing, I would like to take this opportunity to wish you a most successful and profitable convention. Thank you!

Address of the President-Elect, Dr Edward J. McCormick

Dr Edward J. McCormick, President Elect, presented the following address, which was referred to the Reference Committee on Reports of Officers:

Mr Speaker, Dr Bauer Distinguished Guests Officers and Members of the House of Delegates of the American Medical Association Because of the many problems to be studied and considered at this session, the remarks of your incoming president will be brief. I am grateful to you who have elevated me to high office. I am humble, because I can look back at a long line of America's most distinguished physicians who have preceded me as President. The history of our organization, and its accomplishments, testify to the quality of its leadership through the years. As a member of this House, its councils and committees, and of the Board of Trustees, I have had ample opportunity to learn and to know the aims and purposes of American medicine. Like most of you, I have spent countless days and hours and have traveled thousands of miles in the interest of the American Medical Association's policies as defined by you—the representatives from our states and territories, the representatives of 140,000 physicians.

With the thought in mind that most medical problems have been studied in the course of the century, it would seem difficult, if not impossible, for a President-Elect to suggest a new program. Nor is such a course necessary. The important consideration is to strive to perfect the movements already initiated. The American Medical Association is a great organization. We have made rapid strides in the past ten years. All departments and councils have been expanded. The Councils on Medical Service, Rural Health, and National Emergency Medical Service, the Committees on Research, Mental Health, and Blood, the Washington Office and the Department of Public Relations all have come into being in the last decade. With the aid of a competent headquarters staff, our various councils and committees have considered virtually every scientific and economic facet of medicine. This increased activity has resulted in increased national prestige and in heavier demands on the officers and trustees. It has been matched by a rapid growth in the activities of state and county societies. This has necessitated better liaison between the national association and local

medical groups. We have added field men to our staff, and all department heads, officers, and trustees are doing more traveling to meet with constituent and component societies. To me, this phenomenal progress is the result of intelligent and fearless leadership in this House and in each and every state and county society. I am relying on the continuation of this leadership to make my administration comparable in progress with those that have preceded me during recent years.

I would like to make a few suggestions today in the hope that you will consider them favorably and take them home to your state societies. These ideas are not new, but their further development will solve many of medicine's problems and eliminate much of the criticism to which we are subjected.

(1) The distribution of doctors is a problem. Much has been done by medical organizations to solve it. Placement services are now in existence in 37 states. Of these, 32 are operated by medical societies. Other societies have set up successful scholarship programs for young men and women willing to return to general practice in the rural areas of their states. It is important to the future of medicine that every community have access to a physician. Medicine must actively aid those communities which are trying to attract doctors by building modern facilities for them.

(2) Whenever one speaks to persons about medical service, the availability of physicians enters the conversation. Over 600 of our county medical societies now have 24-hour emergency call services. I urge all others to support such a system. The importance of this activity is self-evident.

(3) Every medical society must have a strong and fearless mediation committee to hear patients' complaints. Those must not be whitewash committees. They must be true to the purpose of their founding by reprimanding and disciplining physicians found guilty of exploiting their patients. Only in this way can public confidence in medicine be maintained.

(4) Physician and hospital relationships must be clarified and steps taken toward mutual cooperation. The Board of Trustees has done much work on this problem during the past year. I advise the formation of physician hospital committees by state and county medical societies to work toward better relations in local communities. This has already been done with some success in Massachusetts, Connecticut, and other states.

(5) Every county society should become an active unit in the nationwide effort to develop and expand voluntary health insurance. We must find ways of providing protection against catastrophic illness and coverage for older age groups.

(6) Too many physicians have been isolationists within their communities. Local societies should encourage each individual member to participate in some civic undertaking. We physicians should be rendering health leadership in all service clubs, fraternal organizations, Parent-Teacher Association groups, church associations, and unions. We cannot expect these organizations to be interested in our problems if we are not interested in theirs. We must rub elbows on a social and organizational basis with persons outside the profession.

(7) Continued emphasis should be placed on improving the public relations techniques of individual physicians. Every doctor must be brought to realize that public relations begins in his or her office—that the way in which they treat patients reflects for good or ill on the entire profession. Medical societies are frequently hampered in their efforts to build public understanding by the doctor who overcharges, the doctor who rudely refuses to answer a night call no matter how urgent, or the doctor who keeps patients waiting for hours in his reception room without any explanation.

(8) There are some newspaper and radio people who honestly believe some of the untruthful charges which have been made against medicine. All county and state societies should make continued efforts to develop a close association with writers for press, radio, and television. Through frank, thorough discussion of medicine's problems and what is being done about them, these people can often be transformed into working allies for medicine's cause. We often find we have

been striving for the same goals and that our distrust of each other has been based solely on misunderstanding

(9) There is a need for unity within the profession. A few years ago, when we had to close ranks and fight shoulder to shoulder against an immediate threat of compulsory health insurance, we worked as a team. With some of this pressure off, I have noticed a distressing regression toward petty internal wrangling, charges and countercharges, and divisive activities by various groups within the profession.

Constructive criticism has a universally recognized place within any democratic group. I always respect a man who stands up on the floor of this House of Delegates and in ringing tones announces his beliefs. I expect every man to vote according to his principles. I believe that different opinions should be given ample opportunity to be heard before the various reference committees of the House. Certainly I know that every letter written by a member or a delegate to the Secretary and General Manager or the Board of Trustees is given respectful attention. This same atmosphere should prevail in our county and state societies, for only by allowing free expression of opinion can progress be made. Once this House has voted on an issue, however, I believe we should understand that the democratic process has had its way and the majority has ruled. If we believe in democracy, we have to be prepared to accept with good grace a decision contrary to that we would have preferred. This does not mean we cannot continue to work for our beliefs. We should work for them in an orderly fashion within the ranks of organized medicine, and we should encourage all physicians to work for change in this way. Quiet persuasion can be a potent force. On the other hand, violent charges in the public press and uninformed testimony before Congress are destructive rather than constructive tactics.

As members of the House of Delegates of the American Medical Association, and as officers and trustees of this greatest of all medical organizations, we must at all times be conscious of our twin roles as physicians and statesmen. We must be concerned first and always with what is best for the public and for the profession as a whole, not with what is best for our own particular interests. We must speak with the tongue of reason and the courtesy of gentlemen, and we must base our statements on fact. If we adopt this attitude, and encourage other physicians to do likewise, perhaps the medical profession can continue to pull as a team. Certainly we shall make more progress that way.

In closing, may I repeat the pledge I made to you a year ago—that I shall devote myself with singleness of purpose in the coming year to serving you and, in serving you, to advance the ethical standards of American medicine and promote the public health and welfare.

Report of Reference Committee on Reports of Officers

Dr George A. Woodhouse, member, presented for Dr Wyman D. Barrett, Chairman, the following report, which was adopted:

In the first official appearance of Dr McCormick before the House, he presented many problems to be studied and considered. His remarks were pointed and his suggestions for future accomplishment were sound. He outlined the activities of the American Medical Association and its various component parts and then presented for the consideration of the House a number of pertinent suggestions which will be discussed by your committee.

(1) The necessity for providing additional placement services in certain sections of the country, to be operated by state or local medical societies, and the scholarship training programs of state societies were pointed out so that if possible every community will have access to a physician.

(2) Your committee recommends that the twenty-four hour emergency call service be extended throughout the country whenever possible.

(3) Each county medical society should immediately set up "Mediation Committees" to hear patients' complaints. Your committee suggests that the title "Mediation Committee" in-

stead of "Grievance Committee" be adopted as the terminology.

(4) Dr McCormick's suggestion of the physician-hospital relationship being clarified would be best handled by, as he suggested, a liaison physician-hospital committee at the state and county levels.

(5) It is recommended by your committee that each county medical society take an active interest in developing and expanding the voluntary health insurance program.

(6) The recommendation that the profession become more interested in all local activities is excellent and is approved by your committee.

(7) A keystone of the problem of public relations between the profession and the public rests in the office of the individual doctor and his contact with his patients.

(8) Your committee is of the opinion that publicity and press relations committees should be set up in all state and county medical societies that have not done so. In this manner, only proper information will be released to the public.

(9) Your committee agrees that there is need for unity within the profession and this can be accomplished by better ethical and professional relations. Individual physicians have the prerogative of disagreeing with decisions made by the House of Delegates at any time. However, their criticism should be of a constructive nature.

After reviewing the address of Dr McCormick, your committee is of the opinion that his projected program for the ensuing year will provide the American Medical Association with continued outstanding leadership.

Report and Supplementary Report of Board of Trustees

Dr Dwight H. Murray, Chairman, presented the following report of the Board of Trustees (see THE JOURNAL, April 25, 1953, pages 1495-1497, for the Financial Statement and Treasurer's and Auditor's reports) which was referred to reference committees as follows:

To the Reference Committee on Reports of Board of Trustees and Secretary: Financial Statement, Dues of the Association under the heading Report on Matters Referred by House of Delegates, St. Louis Meeting, Treasurer's Report, Auditor's Report, and Appreciation.

To the Reference Committee on Medical Education and Hospitals: Resolutions on Problems of Accrediting Nursing Schools, Resolution on Definition of Medical and Dental Services, Hospital-Physician Relationships.

To the Reference Committee on Insurance and Medical Service: Resolution on Responsibility of the Government in the Medical Care of the Citizen, Professional Liability Insurance, Liaison Committee to Organizations Concerned with the Care of Veterans.

To the Reference Committee on Miscellaneous Business: Report of Committee for the Study of Relations Between Osteopathy and Medicine.

Except for the item on Dues of the Association, no reference was made of the Report on Matters Referred by the House of Delegates.

REPORT ON MATTERS REFERRED BY THE HOUSE OF DELEGATES

Resolutions. The following resolutions, adopted by the House of Delegates in December, 1952, were referred, in accordance with recommendations of the House, to the councils or committees indicated.

(1) Two resolutions on the subject of medical malpractice liability insurance, one introduced by Dr Herbert P. Ramsey, District of Columbia, and the other by Dr J. P. Culpepper, Mississippi, to the Council on Medical Service.

(2) Resolutions on funding of policies of the House of Delegates, introduced by Dr Ralph A. Johnson, Michigan, to the Council on Constitution and Bylaws.

(3) A substitute resolution on responsibility of government in the medical care of the citizen, introduced by Dr Russel V.

Lee, Section on Military Medicine, to the Council on Medical Service,

(4) A resolution on establishment of a permanent bureau to deal with problems concerned with the relationships between physicians and lay technical workers in auxiliary fields of medicine, introduced by Dr Frank H Krusen, Section on Physical Medicine and Rehabilitation, for that section and for the delegates of seven other sections, to a committee composed of representatives of the Board of Trustees and the Council on Medical Education and Hospitals which is studying the whole question of relations between physicians and professional, non-physician groups, and

(5) A substitute resolution for the resolution on the problem of accrediting nursing schools introduced by Dr Wendell C Stover, Indiana, to the Joint Commission for the Improvement of the Care of the Patient

Final reports have not as yet been received on these matters but it is hoped that they will be available in time to be included in a supplementary report of the Board to the House

Dues of Association In December, 1952, the House of Delegates adopted the following recommendation of the Reference Committee on Miscellaneous Business on the subject of billing and collecting American Medical Association dues

Your committee believes that there is considerably more dissatisfaction with the present rate than has been brought to the attention of the Board of Trustees. Apparently this rate of 1% does not cover the cost of billing and collection of dues especially in those states with a large membership. Your committee suggests that the Board of Trustees give serious consideration to the establishment of a sliding scale of payment to take care of the differences in these costs

It is believed that the present rate of 1 per cent does not cover the cost of billing and collecting Association dues in many state societies, in others, however, it is adequate. From what the Board of Trustees can learn, the methods of collecting the dues in the various state societies have been improved considerably and the work involved has been greatly reduced. Furthermore, it is believed that with time this can be lessened to a point where some evaluation can be made on a sound basis. At the present time it is thought that possible short-cuts to collecting have not been exhausted in some of the states. Several societies bill members separately for American Medical Association dues, others have elaborate systems of bookkeeping. These methods, of course, increase the expense.

The Board of Trustees asks the indulgence of the House of Delegates for a further period of experimentation before any definite system is established relative to the billing and collecting of dues for the parent organization.

Definition of Medical and Dental Services The resolution on the definition of medical and dental services, introduced by Dr Gordon F Harkness, Section on Laryngology, Otology and Rhinology, was given serious consideration by the Board of Trustees and a committee was appointed to study the matter. A meeting was held on March 21 with several representatives of the Board of Oral (Dental) Surgery of the American Dental Association in an effort to arrive at an equitable solution to this problem. A statement on the results of the meeting will be presented by the Board of Trustees in a supplementary report.

Federal Medical Services As recommended by the House of Delegates in its adoption of the report of the Reference Committee on Insurance and Medical Service, the Board of Trustees appointed a committee composed of Drs E S Hamilton, Chairman, W B Martin, James R McVay, Louis M Orr II, and J D McCarthy, with E L Henderson as consultant, to confer with representatives of the veterans' organizations, the American Dental Association, the American Hospital Association, the Department of Defense, and the Veterans Administration in an effort to resolve the problem of the medical care and hospitalization of veterans with non-service-connected disabilities.

A meeting of this committee with representatives of several interested organizations was held in Washington, D C, on March 1. A report on the proceedings will be incorporated in the supplementary report of the Board.

Prerequisite for Specialty Board Certification In his address before the House of Delegates in December, 1952, Dr Louis

H Bauer, President, recommended the appointment by the Board of Trustees of a committee to confer with a committee from the Advisory Board for Medical Specialties to learn whether some change can be made to increase the number of general practitioners.

A resolution, similar in intent, suggesting that the Speaker of the House appoint a committee to study the possibility of requiring one or more years' service in general practice as a prerequisite to specialty board certification was introduced by Dr A C Scott Jr, Texas.

Both recommendations were adopted by the House of Delegates and, in accordance with the directives of the House, its Speaker and the Board of Trustees selected the following committee to study the problem: Drs A C Scott Jr, Texas, Eli S Jones, Indiana, Norman S Moore, New York, and ex officio, F J L Blasingame and David B Allman, Trustees.

Medical Specialty Boards The statement adopted by the House of Delegates in December, 1952, reiterating its position previously established with respect to the recognition and approval of only one certifying board in each of the specialties of medicine, was, in accordance with the recommendation of the Reference Committee on Medical Education and Hospitals, transmitted to the Advisory Board for Medical Specialties, the individual specialty boards, the American College of Surgeons, and the International College of Surgeons.

Privilege Tax by Hospitals The action of the House of Delegates in condemning the practice of requiring all physicians using a hospital to pay to it a certain percentage of their fees received from hospitalized patients, brought to the attention of the House by the Judicial Council in its report in December, 1952, was referred to the American Hospital Association for dissemination to its membership.

In some instances throughout the above report it has been indicated that a statement on a subject will be presented as a part of the supplementary report of the Board of Trustees. This is necessitated by the fact that the study groups were still working on the projects referred to them and have not had sufficient time to prepare a final report for action by the Board of Trustees prior to the publication date of the Handbook.

ST LOUIS SESSION

The St Louis Medical Society nominated Dr Llewellyn Sale Sr as General Chairman of the Local Committee on Arrangements for the St. Louis meeting to be held Dec 1-4, 1953, and the Board of Trustees unanimously confirmed the nomination.

APPRECIATION

I should like to express my appreciation to the members of the Board of Trustees for their diligent efforts in their consideration of the multiple and complex problems of the Association which have been referred to them in the past year. Meetings are becoming more numerous and longer, and the number of committee appointments for each member of the Board is increasing. The time and effort spent by the members of the Board is a great service to medicine. I should like also to call the attention of the members of the House of Delegates to the amount of travel and time put in by our President, who, as President Elect, traveled over 50,000 miles and as President, 100,000 miles. During that time he has visited 32 states, some of them more than once, and 21 countries. The President-Elect has traveled many thousands of miles, he has visited 18 states, some of them two or three times. The Secretary and General Manager has also spent much of his time in travel and has visited a number of state societies at their annual meetings, as well as societies which are associated with the American Medical Association but are not constituent or component societies thereof. I wish to call the attention of the House of Delegates to the effort that is being put forth by your Association to carry information on medical problems to the four corners of the United States and to the countries of the world.

With increasing responsibilities of the Association, in like manner the duties and responsibilities of the staff have increased. The staff at all times has very willingly rendered prompt and capable service to the general officers. Such assistance is duly appreciated by those whom they serve.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr H Russell Brown, Chairman, presented the following report, which was adopted

Financial Statement in Report of Board of Trustees Your committee views with approval the excellent financial condition of the Association and particularly the improved collection of dues during 1952. While there has been a marked increase in material, labor, and salary costs during the past year, your committee believes that the Board of Trustees should be commended for the excellent financial result in the management of funds. This committee notes with concern, however, the increased expenditures during 1952 of the Councils, Bureaus, and related activities, and urges the Board of Trustees to evaluate carefully the increases in their budgets. The accounts of the Association have been audited in the proper manner by an independent accounting agency.

Dues of the Association Your committee recognizes a divergence of opinion among state medical associations regarding methods and costs in the collection of American Medical Association dues. It believes that the Board of Trustees should be granted its request "for a further period of experimentation before any definite system is established relative to the billing and collection of dues for the parent organization."

St Louis Session Your reference committee notes with satisfaction the report of the Board of Trustees regarding arrangements for the St Louis session.

Supplementary Report of the Board of Trustees on Appreciation, Presented by Its Chairman, Dr Murray Your committee concurs wholeheartedly with the report and wishes to add its approval of the excellent work done by the Board of Trustees, general officers, Secretary and General Manager, and staff of the Association.

RESOLUTIONS ON PROBLEM OF ACCREDITING NURSING SCHOOLS

In accordance with the recommendation of the Reference Committee on Medical Education and Hospitals adopted by the House of Delegates in December, 1952, the Board of Trustees referred the substitute Resolutions on Problem of Accrediting Nursing Schools to the Commission for the Improvement of the Care of the Patient for consideration and report.

The American Medical Association's representatives on the Joint Commission, together with the Director of the Accreditation Program of the National League for Nursing, Inc., and a representative of the American Hospital Association, met in Chicago on Feb 8. The Committee met again on March 6 and 7 to review the problem presented by the resolution. Consideration was given to facts and figures on the number of available nurses, the Accreditation Program of the National League for Nursing, the number of enrollments in nursing schools in the country, and the role of the trained practical nurse in the care of the sick, and the following recommendations were made to the Board of Trustees:

1 It is accepted by all groups that a shortage of nursing personnel exists particularly in the field of bedside nursing.

2 Your committee recommends the approval in principle of accreditation of nursing schools and recommends that your representatives on the Commission for the Improvement of the Care of the Patient keep the Trustees informed as to changing conditions and procedures.

3 It recommends that the project be correlated with that of the Joint Commission on Accreditation of Hospitals, the method to be recommended by the Joint Commission after conferences with the representatives of the nursing groups, or that a special group made up of hospital administrators, nurses, and doctors carry on the program.

4 Conferences have been held in various parts of the country with state nursing leaders in attendance. It is recommended that physicians, hospital administrators and members of hospital boards of trustees be invited to participate in these conferences.

5 In some instances where difficulties have arisen informal conferences have been held with benefit to all.

6 Your committee strongly reaffirms its recommendation of 1948 that the present three year program for diploma training courses be reduced to two years.

7 In 1948 your committee recommended that provision be made and credits allowed in selected cases for advancement from trained practical

nurse status to hospital diploma courses and from hospital diploma status to collegiate degree courses without loss of time. It strongly reaffirms its position.

8 Your committee also recommends that the trained practical nurse program be a joint effort of doctors, hospital administrators, and nurses.

The Board of Trustees has approved the report presented and wishes to submit the recommendations to the House of Delegates for its consideration and action.

RESOLUTION ON DEFINITION OF MEDICAL AND DENTAL SERVICES

At the meeting of the representatives of the Board of Trustees and the American Board of Oral Surgery (Dental), the American Dental Association and the American Hospital Association, held on March 21, 1953, for a discussion of the Resolution on Definition of Medical and Dental Services adopted by the House of Delegates in December, 1952, the following statement was approved by those in attendance. Subsequently it was approved by the Board of Trustees for presentation to the House of Delegates at this time with the recommendation that it be adopted.

The position adopted by the representatives at the meeting on March 21 was to the effect that the oral (dental) surgeon be assigned to the surgical service of a hospital and to perform such professional duties as the chief of the surgical service directed. The members of the American Board of Oral (Dental) Surgery stated that this plan was one which they drafted similar to that of the Joint Commission on Accreditation of Hospitals and was fully satisfactory.

HOSPITAL-PHYSICIAN RELATIONSHIPS

I would like to give you a little background information on the report on hospital physician relationships which the Board of Trustees wishes to submit at this time to the House of Delegates.

In 1951 the Board appointed a committee to meet with representatives of the board of trustees of the American Hospital Association for a discussion of matters of mutual interest. During the past months several meetings have been held by representatives of the two organizations. At the last session, held on March 21, 1953, a statement on the question of hospital-physician relationships was prepared and approved by the representatives of the two groups and was also approved by the Board of Trustees. The statement is submitted at this time to the House of Delegates for whatever action it wishes to take.

REPORT OF THE JOINT COMMITTEE ON HOSPITAL-PHYSICIAN RELATIONSHIPS OF THE BOARDS OF TRUSTEES OF THE AMERICAN MEDICAL ASSOCIATION AND AMERICAN HOSPITAL ASSOCIATION

Physicians and hospitals are both concerned with rendering medical care. Their first consideration is their desire to promote the welfare of the patient and the community which they serve. Physicians are the individuals who provide medical care—whether it be in the home, the office, or the hospital. With the ever increasing complexity of modern medical care, however, the role of the hospital in providing an organization and an environment in which the physician may care for patients is assuming increasing importance.

Problems associated with the evaluation of services by hospitals and by physicians are different. It is possible to develop minimum standards in a hospital by which the adequacy, type, and quality of hospital service may be measured and compared and the cost per unit of service determined. It is much more difficult to evaluate the services of a physician. Specialty boards have done much to improve the quality of service. Although a specialty board may find that an individual has had good training and that he is capable of carrying out certain procedures, it cannot know what is in his heart and soul, his sense of obligation, or degree of devotion to his duty.

With the increase in size and complexity, care rendered in hospitals tends to become less personal. In an effort to overcome this, hospitals have striven to indoctrinate all associated with them in the desirability of developing a more individual touch. Medicine, on the other hand, by its very nature, is more personal. It is both a healing art and a science. These two

cannot be divorced without grave injury to medicine and to the quality of care received by patients both within and without the hospital

With the rapid advance of the science of medicine in the past fifty years, the importance of the art has been lost sight of by many. The tendency to put faith in the physical attributes of medicine—building, equipment, and technicians—has developed to an increasing degree a mechanistic rather than an intellectual and spiritual approach to medicine and its problems. One evidence of this has been an over use of and over-dependence on technical procedures in hospitals at the penalty of increased operating costs and possible deterioration in the quality of performance of these technical procedures. This fault does not lie alone at the door of hospitals, since physicians are responsible for the number and type of procedures ordered. It is, however, the result of our present operating procedures and illustrates the failure to integrate adequately the administrative and professional aspects of the hospitals.

On the other hand, the idea that a hospital should be merely a physician's workshop and supply the facilities and tools to allow him to work unhampered by restrictions is untenable. These tools are too numerous, too unwieldy, and too expensive. Their use needs the coordinated efforts of many persons—nurses, dietitians, technicians of all kinds—as well as those of a physician or physicians. Their proper use still requires the fine discrimination in their selection and application that only a physician can supply.

The administrator, under the direction of a governing board, has the primary responsibility of running a good hospital in which good medical care is provided. He is concerned with costs, personnel, housekeeping, maintenance and expansion of facilities, as well as with the medical care provided in the institution. It is his responsibility to coordinate into a smooth-running whole the multiple activities of his institution. He looks to the board on the one hand and to the professional staff on the other. Because of the nature of his position and his responsibilities, he looks more directly to the board. His worth, however, must be evaluated finally on the basis of how well he maintains a good hospital within available resources.

The governing boards of hospitals are usually made up of men and women of demonstrated ability, occupying positions of prominence, who have evinced interest in community welfare. These persons add strength to the hospitals by their names, general knowledge of affairs, money-raising power, and prestige. They are not necessarily particularly informed as to the many intricate problems involved in the production of good medical care. While there are many who go deeply into the problem of hospital finances and management, few of them ever have the opportunity to make themselves familiar with the problems of medicine. The very nature of their assignment continues this segregation of thought. The board has frequent and often intimate contacts with the administrator and little or none with the professional staff or its representatives. If they have opinions on medical matters, they are likely to be gained from their personal medical advisor or by casual contacts at social gatherings or on the golf course. It follows, therefore, through no fault of his own, that the administrator may have undue influence with the board in professional matters as well as those that properly come within his province.

Misunderstandings between hospital management and the medical profession arise from fears concerning each other. Some of these are reasonable and some are unreasonable. Some arise from conflicts of personality in particular institutions. These differences have been aggravated by certain general trends and by proposals coming from within and without the ranks of those providing medical care. A physician desires to maintain and strengthen the art of medicine as well as promote the greatest possible advance in the science of medicine. He sees medicine more and more mechanized and coming more and more under the direction of administrators and boards in hospitals.

The administrator and the board are concerned not only with the over-all quality and quantity of service rendered by

hospitals but also with the financial integrity of their institution. Certain of the factors involved in the production of good medical service come directly and properly under their control. They may be disturbed, however, by dissension in the professional staff, by clique or favoritism, or by failure of the staff to maintain a high quality of professional service. Hence, they may be tempted to interfere with professional control or professional practice. It should be noted that in the past professional standards have been raised substantially through the influence of professional groups and by the action of special committees of the professional staffs of individual hospitals. It would seem unnecessary to state that in a learned and highly technical profession the true qualifications of a member can only be judged by other members of the same profession. The administrator and the board are also troubled at times by multiple and unreasonable demands made on them by the professional staff. This often arises from lack of understanding on the part of the staff members of the total responsibility of the administrator and the total load on the resources of the hospital.

It is a basic principle that hospital governing boards and administrators should not attempt to tell physicians how to practice medicine but rather must see that the hospital medical staff organizes to provide a framework for staff self government which will maintain and improve the quality of medical care in the hospital.

Physicians, on their part, must understand that the hospital governing board is legally and morally responsible for the entire operation of the hospital. The medical staff is responsible to the governing board for proper medical care in the hospital.

The medical profession has provided leadership in improving the quality of care in hospitals. Such efforts, however, do not always receive the support of every member of the hospital medical staff. The authority of the hospital governing board and administrator may be used to enforce rules not complied with by individual members of the staff, although the rules have been developed and approved by vote of the organized medical staff. This authority of the hospital governing board and administrator, when in proper focus, has been an important force in improving the quality of care in the hospitals of this country.

Lack of understanding and appreciation of these important relationships has caused much criticism and irritation between the members of the hospital governing board, the medical staff and the administrator.

A continued increase in the utilization by hospitals of full time professional men has disturbed many physicians. In the early days of radiology and pathology, this did not seem a threat to the profession. With the great increase in these services and the advent of anesthesiology, physical medicine, cardiology, and other specialties, this threat and the possibility of friction has increased. The practice in certain hospitals of engaging full time obstetricians, surgeons, and other specialists has stirred this alarm further. The trend toward a situation, however, where hospitals with a complete full time staff are engaged in the practice of medicine for a fee, is a matter of concern to many physicians. The profession justly feels that it may lose its independence and become merely a group of high grade technicians, however respected or highly paid. There are many who believe that a group of physicians working full time, under a lay board, will not produce the best of medical care. There are, however, those in the profession who support the principle of "full time" as a means of providing good medical care in a hospital.

Recognizing the intimate relationship and mutual problems, it follows, then, that there must be a clear and well-defined division of responsibility between the professional staff and the governing board of the hospital. Since they are mutually dependent on each other in providing good care in the hospital, they should be mutually assured by methods of organization that neither can encroach on the proper domain of the other. If all board members, administrators, and physicians were saints, possessed of infallible judgment, perfect in their

training and beyond reproach in their actions, there would be no problem. Since these assumptions are not true, it is necessary to adjust their relationship on a basis that will maintain the prerogatives of each. To accomplish cooperation and understanding, there must be a free flow of information and ideas between the professional staff, the administrative head, and the governing board. Each must accept the primacy of the other in certain fields and all must recognize their interdependence in accomplishing their primary objective. Physicians must become familiar with problems of hospital administration and financing. If they do, they will be more understanding and cooperative in conserving the hospital resources and less demanding in their own requirements. They will also be a much more effective instrument in gaining for a hospital community support for its proper operation.

In order to accomplish these objectives, some mechanism must be set up that will bring into frequent and close contact the partners in the hospital endeavor, the administrator, the governing board and the professional staff. It is also necessary that the relationship between physicians and hospitals be clearly defined and, as a guide toward this aim, the following principles are recommended:

1. The general purpose of hospitals and physicians is to aid each other in the delivery of the best possible medical care to patients. To attain such a purpose requires full cooperation among medical staffs, governing boards and administrative heads of hospitals. One important method of attaining this objective is that duly designated representatives of the medical staff shall have free and direct access to the governing board with due consideration to the position of the administrator as chief executive officer of the hospital. The various methods by which the medical staff may have access to the hospital governing board follow. These methods are not listed in the order of their desirability and there may be other acceptable liaison plans developed depending on local conditions.

- (A) The executive committee of the medical staff and a committee of the governing board with the hospital administrator can serve as a joint committee.

- (B) Representatives of the medical staff can serve as members of the medical staff committee of the governing board with the hospital administrator.

- (C) Representatives elected by the medical staff can attend meetings of the hospital governing board.

- (D) Members of the medical staff can be members of the hospital governing board.

2. The professional evaluation of chiefs of service and members of the medical staff should be the responsibility of the medical profession. The method of selection of these individuals must be subject to local arrangement and local conditions. In any such arrangement however the principle of the freedom of the staff to make recommendations subject to the approval of the hospital governing board, should be recognized.

3. The medical profession and the hospitals recognize that certain special services such as anesthesiology, pathology, radiology and physical medicine are integral parts of the practice of medicine and of the services necessary for hospital patients. Physicians in these fields should have the professional status of other members of the medical staff. Chiefs in these specialties must assume also the administrative responsibilities and relationships customarily associated with such positions.

4. The right of an individual to develop the terms of his services on the basis of local conditions and needs is recognized but such contractual arrangements should in all cases ensure (a) the policy of professional incentive for the physician and (b) progressive development of the hospital departments involved in order that increasingly improved services to patients may be rendered. Moreover a physician shall not dispose of his professional attainments or services to any hospital lay body, organization group or individual by whatever name called or however organized, under terms or conditions which permit exploitation of the patient by the hospital or the physician.

5. The chief of a hospital department may have access to financial information regarding his department.

6. It is desirable that means should be provided at local, state and national levels for review of problems of individual hospital-physician relationship by organized medical and hospital groups.

Report of Reference Committee on Medical Education and Hospitals

Dr H. B. Wright, Chairman, presented the following report, which was adopted:

Supplementary Report of the Board of Trustees on the Problem of Accrediting Nursing Schools. The Board of Trustees having conferred with the Commission for the Improvement of the Care of the Patient, the Director of the Accreditation Program of the National League for Nursing, Inc., and a representative of the American Hospital Association, agreed to recommend an eight point program. Your Reference Committee would like to cite particularly Point 6, dealing with the recommendation to reduce the present three

year program for diploma training courses to two years, to Point 7, recommending selected cases for advancement from trained practical nurse status to hospital diploma courses, and from hospital diploma status to collegiate degree courses without loss of time, and to Point 8, in which the committee recommends that the trained practical nurse program be a joint effort of doctors, hospital administrators, and nurses. Your reference committee is in full accord with the supplementary report of the Board of Trustees and recommends its adoption.

Supplementary Report of the Board of Trustees Concerning the Resolution on Definition of Medical and Dental Services. Following a meeting with the American Board of Oral Surgery (Dental), the American Dental Association, and the American Hospital Association, the agreed recommendation was as follows:

The position adopted by the representatives at the meeting on March 21 was to the effect that the oral (dental) surgeon be assigned to the surgical service of a hospital and to perform such professional duties as the chief of the surgical service directed. The members of the American Board of Oral (Dental) Surgery stated that this plan was one which they drafted similar to that of the Joint Commission on Accreditation of Hospitals and was fully satisfactory.

Your reference committee recommends that the word "the" preceding the phrase "surgical service of a hospital" be changed to the word "a" so that it would then read, "be assigned to a surgical service in a hospital."

Your reference committee further recommends that the following definition of a dental-oral surgeon be included in the report:

Dental-oral surgery is to be limited to diseases of the teeth and jaws and lesions of contiguous soft tissues related to diseases of the teeth and jaws but excluding malignancies.

Report of the Joint Committee on Hospital Physician Relationships of the Board of Trustees of the American Medical Association and the American Hospital Association. This excellent report presents a general statement of the principles which in some respects are more specifically stated in the Guide to the Conduct of Physician Hospital Relationships. Your reference committee recommends approval of this report.

RESOLUTION ON RESPONSIBILITY OF THE GOVERNMENT IN THE MEDICAL CARE OF THE CITIZEN

During the December, 1952, session of the House of Delegates Dr. Russel V. Lee, Section on Military Medicine, introduced a substitute resolution for one originally introduced by Dr. Eugene Hoffman, California. This substitute resolution read as follows:

WHEREAS There exists at the present time a state of confusion as to the extent to which government at various levels is committed to the provision of medical services, therefore be it

Resolved That the American Medical Association through its Board of Trustees at a national level and through its component societies at a state and local level call on local, state and federal governments for a precise definition of the area of governmental responsibility for the provision of personal medical services to various groups of people in our population.

This resolution was referred by the Board to the Council on Medical Service for its consideration and reply.

It is the opinion of the Council that the scope of this resolution is such as to involve three of the Council Committees. These are Committee on Federal Medical Services, Committee on Indigent Medical Care, Committee on Maternal and Child Care.

The Council also calls attention to the fact that President Eisenhower, in his special message to the Congress, recommended the establishment of a Commission whose function would be to study and investigate all the activities in which federal aid is extended to state and local governments. Mr. Eisenhower, in his message, stated "the whole question of federal control of activities to which the federal government contributes must be examined." Since there is every possibility that such a Commission will be established, it is the opinion of the Council that the development of a statement concerning the relation of local, state and federal governments in the provision of medical services to the individual should give consideration to the findings of such a Commission.

Also, in this connection mention is made of a subcommittee of the Ways and Means Committee of the House of Representatives, under the chairmanship of Representative Carl Curtis of Nebraska, which is studying the problem of social security.

The work of the three committees of the Council on Medical Service, namely the Committee on Federal Medical Services, the Committee on Indigent Medical Care, and the Committee on Maternal and Child Care, plus the work of the Commission recommended by the President and the Subcommittee of which Representative Curtis is chairman, may be helpful in carrying out the purposes of this resolution.

The Council has therefore requested its committees to review the resolution as it concerns their activities and to make a report when their studies are completed. In this the Board of Trustees concurs, and will transmit the report to the House of Delegates when it is received.

PROFESSIONAL LIABILITY INSURANCE

Two resolutions on professional liability insurance, adopted by the House of Delegates in December, 1952, were referred to the Council on Medical Service. The Council has submitted a preliminary report to the Board, which outlines not only what studies have been initiated but some of the many and complicated problems involved. Apparently it is the feeling of some members of the House that insurance rates for one state may be increased because of adverse experience in some other state. This understanding may be incorrect since the philosophy of rate making bodies is to the end that premiums are designed to reflect the experience attributable to each class of risk in each rating jurisdiction. The Council on Medical Service has requested, and the Board has granted, permission to undertake further specific studies. The complex nature of many of these problems other than rates are such that a definitive report cannot be made to the House until a later date.

LIAISON COMMITTEE TO ORGANIZATIONS CONCERNED WITH THE CARE OF VETERANS

The following report, which I shall read in its entirety because of its importance, was submitted to the Board of Trustees by the Liaison Committee composed of Drs. Edwin S. Hamilton, Chairman, Walter B. Martin, James R. McVay, Joseph D. McCarthy, Louis M. Orr II, and E. L. Henderson, consultant, appointed to meet with various organizations concerning the provision of medical care and hospitalization for veterans with non service-connected disabilities. The report was approved by the Board and is submitted at this time with the recommendation that it be adopted by the House of Delegates.

REPORT OF LIAISON COMMITTEE TO ORGANIZATIONS CONCERNED WITH THE CARE OF VETERANS

At the December, 1952, session of the House of Delegates of the American Medical Association a report of a Special Committee on Federal Medical Services was considered. In commenting on Part I of this report dealing with medical and hospitalization benefits for veterans with non service-connected disabilities the Reference Committee on Insurance and Medical Service stated in part:

The reference committee believes that the recommendation of the Special Committee that the provision of medical care and hospitalization in Veterans Administration hospitals for the remaining groups of veterans with non service-connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community where it rightfully belongs cannot be accomplished without the cooperation of Congress, veterans organizations and the medical profession. Your reference committee after conducting extensive hearings is of the opinion that the only honorable, equitable, and reasonable way to approach this problem is to recommend to the House of Delegates that the American Medical Association, the veterans organizations, the American Dental Association, the American Hospital Association and representatives of the Department of Defense and the Veterans Administration sit down and try to reach reasonable conclusions for appropriate action from agreed upon data rather than take any precipitate action now.

This recommendation was adopted by the House of Delegates on Dec. 4, 1952, and was implemented by the Board of Trustees through the appointment of the subject committee.

In accordance with the recommendation of the House of Delegates the Committee met with representatives of the American Legion, American Hospital Association, American Dental Association, Veterans Administration, Public Health Service, and Department of Defense at the Statler Hotel in Washington, D. C., on March 1, 1953. The meeting, which was organized jointly by this committee and the Medical Liaison Committee of the American Legion, considered the following points:

- (1) Present law and regulations covering eligibility for hospitalization. Processing and administration of Veterans Administration application form 10 P-10.
- (2) Number and categories of hospitals and beds in the Veterans Administration system.
- (3) Classification of hospitalized veterans as to war service, type of disability, etc.
- (4) Record of admissions and discharges.
- (5) Department of Medicine and Surgery, Veterans Administration—residency and Deans Committee Program—research contribution to medicine.

In connection with the first item, Mr. E. E. Odom, Solicitor of the Veterans Administration, presented a summary of the laws providing for the hospitalization of veterans. The material which he discussed was substantially the same as that appearing on pages 3-6 of the printed report of the Special Committee on Federal Medical Services submitted in December, 1952.

Item No. 5 was covered through the presentation of a paper by Dr. J. C. Nunemaker, Chief, Education Division of Research and Education Service, Veterans Administration, outlining the research program of the Veterans Administration.

The principal discussion at the meeting centered around items 2, 3 and 4. The Chairman of the Committee outlined the general position of the American Medical Association with respect to the provision of hospitalization and medical care by the federal government to veterans with non service-connected disabilities and expressed concern over the rapidly expanding federal hospital program. The need for congressional review and probable curtailment was suggested by Dr. Martin.

Dr. H. D. Shapiro, Senior Medical Consultant, Mr. Robert M. McCurdy, Chairman, Medical Liaison Committee, Mr. E. A. Hayes, and Mr. E. V. Cliff were the principal spokesmen for the American Legion in this discussion. In brief, they challenged the accuracy of the figures being cited in connection with medical care for veterans with non service-connected disabilities; they referred to the results of surveys conducted by the American Legion which reflected only a few infractions of existing law; they expressed vigorous opposition to any change in the basic law providing for such benefits and they proposed a further survey of the problem by the groups represented at the meeting.

Representatives of other organizations and agencies in attendance either had no comments to make or stated that they felt the problem should be studied further.

Following the meeting of March 1, 1953, the Committee again reviewed the report of the Special Committee on Federal Medical Services. It has also followed with interest articles appearing in the press and statements by members of the Congress concerning this subject.

As a result of its activities, the Committee is of the opinion that the diverse interests of the groups and organizations represented at the meeting on March 1 make it extremely difficult for the adoption of a uniform approach to the problem.

Although there may have been sound reasons for originally providing care for veterans with non service-connected disabilities, it is the belief of the Committee that subsequent circumstances require a review of that position. In considering this matter, we feel that it is imperative that cognizance be taken of medical manpower problems in general and of the combined effect of the various governmental medical programs on the health of the nation.

The federal government now maintains five major hospital construction and teaching programs. The medical services of the Army, Navy, Air Force, Public Health Service, and Veterans Administration have been gradually expanded by drawing into their spheres a constantly increasing number of civilians who previously were cared for by private civilian medicine. In order to qualify for resident and intern training it is necessary for service hospitals to provide diversified clinical material. As a consequence, there has been increasing pressure to draw into these hospitals the dependents of service personnel and non service-connected general medical and surgical cases from among the veteran population.

As a result, government hospitals are in competition with civilian hospitals not only for personnel but also for patients. Although the federal government, aided by states and local subdivisions, is spending millions of dollars under the Hill-Burton Act in civilian hospital construction it is making it difficult for them to operate at a reasonable cost by diverting patients into hospitals wholly supported by the federal government. This policy is producing a wasteful duplication of hospital facilities and an unwarranted dispersion of health personnel which not only threatens our great voluntary civilian teaching program but also causes a continual increase in the cost of hospital and medical care for persons who must pay their own way.

With the rapid increase (1,000,000 per year) in the size of the veteran population which now exceeds 20,000,000 and the gradual shift in their age distribution to the higher age levels, it is also questionable whether the cost of such a program is a proper charge on the balance of the population. A consideration of the tremendous expansion which will be necessary in the Veterans Administration medical program the next 10 to 25 years demonstrates conclusively the need for reanalysis of the program by the Congress.

It is urged, therefore, that the House of Delegates reconsider its action of Dec 4, 1952, and adopt the recommendation of the Special Committee on Federal Medical Services with respect to the provision of medical care and hospitalization benefits for veterans with non service-connected disabilities. These recommendations, which appear on page 55 of the printed report, provide

'Part One—Your Committee recommends with respect to the provision of medical care and hospitalization benefits for veterans in Veterans Administration and other federal hospitals that new legislation be enacted limiting such care to the following two categories

- (a) Veterans with peacetime or wartime service whose disabilities or diseases are service incurred or aggravated, and
- (b) Within the limits of existing facilities to veterans with wartime service suffering from tuberculosis or psychiatric or neurological disorders of non service-connected origin, who are unable to defray the expenses of necessary hospitalization

"Your Committee recommends that the provision of medical care and hospitalization in Veterans Administration hospitals for the remaining groups of veterans with non service-connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community, where it rightfully belongs

'The recommendation of the Committee with respect to the treatment of veterans with tuberculosis and neuropsychiatric disorders of non service origin in federal hospitals is believed necessary at this time because of the inadequacy of local facilities designed to provide treatment for all such cases. It is the feeling of the Committee, however, that the entire question of whether the care of these patients is a local or a federal responsibility must be reanalyzed by the Congress. The rapidly expanding veteran population and the need for facilities for the remainder of our citizens afflicted with these diseases suggests that community facilities must be developed under state or local administration for the benefit of all. Preferential treatment for veterans with these non service-

connected disabilities cannot be continued indefinitely, in view of its detrimental effect on the health and the economy of the entire nation."

Report of Reference Committee on Insurance and Medical Service

Dr Gerald V. Caughlan, Chairman, presented the following report, which was adopted

Supplementary Report of the Board of Trustees on Resolution on Responsibility of the Government in the Medical Care of the Citizen. This is a study to determine the precise definition of the area of governmental responsibility for the provision of personal medical service to various groups of people in our population. This was referred by the Board of Trustees to the Council on Medical Service for consideration and reply. This problem is being studied conjointly with the commission appointed by President Eisenhower and a subcommittee of the Ways and Means Committee of the House of Representatives, under the chairmanship of Carl Curtis of Nebraska, which is studying the problem of social security.

Your reference committee accepts this as a progress report by the Board of Trustees and the Council on Medical Service, and recommends a continuation of the study with a full report when a conclusion is reached.

Supplementary Report of the Board of Trustees on Professional Liability Insurance. This has to do with the difference in rates for insurance in the various states and the Council on Medical Service has requested, and the Board has granted, permission to undertake further studies. This is a progress report and your committee approves continuation of this study.

Supplementary Report of Board of Trustees on Liaison Committee to Organizations Concerned with the Care of Veterans and Resolutions on Treatment of Non-Service-Connected Disabilities on Medical and Hospital Care and Benefits for Veterans, and on Reconsideration of Report of Special Committee on Federal Medical Services, Introduced by Delegates from California, Georgia, New Jersey, New York, Ohio, Oregon and Texas. Your reference committee considered the seven resolutions referred to it having to do with the treatment of non service-connected disabilities by the Veterans Administration, together with the report of the Liaison Committee to Organizations Concerned with the Care of Veterans presented by the Chairman of the Board of Trustees in its supplementary report. The Liaison Committee, composed of Drs Edwin S. Hamilton, Chairman, Walter B. Martin, James R. McVay, Joseph D. McCarthy, Louis M. Orr II, and E. L. Henderson, Consultant, was appointed to meet with various organizations concerning the provision of medical care and hospitalization for veterans with non service-connected disabilities.

After several hours of open hearings and a lengthy executive session your committee has arrived at a decision which will be incorporated in general recommendations rather than in specific comments on the various resolutions and reports submitted. It is the committee's belief and sincere hope that all interested individuals and groups have had a fair and full hearing. Your committee is completely aware of the importance of this problem and the many ramifications which are involved. It has approached its task with an open mind and with the desire to serve the best interests of the public, the veteran population and the medical profession.

Before stating its conclusions your committee would recall to your minds the action taken by the House of Delegates in this matter on Dec 4 of last year. At that time the House had before it a report of a Special Committee of the Board of Trustees appointed to study various aspects of federal medical care. Part One of that report dealt with the subject now under discussion. It was the recommendation of that Special Committee that, except in cases involving tuberculosis or psychiatric or neurological disorders, responsibility for the care of veterans with disabilities or diseases of non service-connected origin should be returned to the individual and to the local community. Although this principle was accepted by the House it was felt that it could not be accomplished, "without the cooperation of Congress, veterans' organizations,

and the medical profession ' The House therefore recommended at that time that representatives of the American Medical Association, the veterans' organizations, the American Dental Association, the American Hospital Association, the Department of Defense and the Veterans Administration meet in an effort to resolve the problems involved

As indicated above one of the items before your reference committee was the report of the Liaison Committee appointed by the Board of Trustees to meet with the organizations mentioned This report discusses a meeting of these groups held in Washington on March 1 of this year and the other activities of the Committee The conclusion of the Liaison Committee is that the original recommendations of the Special Committee on Federal Medical Services, in this regard, should now be adopted by the House of Delegates

It has been alleged by representatives of the American Legion and the Veterans Administration that the original report of the Special Committee on Federal Medical Services is inaccurate and that the Liaison Committee under the chairmanship of Dr Hamilton has failed to consider all of the material presented These representatives have proposed that your reference committee reject the recommendations of these two committees and that a further effort be made to arrive at solutions to the problems involved by joint meetings and through administrative channels In this regard, your committee has not been advised of any substantial inaccuracies in the original Special Committee report and is of the opinion that all material of consequence to the basic question involved has been considered by the Liaison Committee

It appears that the principal confusion in this matter emanates from a failure to understand just what the basic question is It is the belief of your committee that the medical profession must concern itself, not with the numbers of 'chiselers' in Veterans Administration hospitals nor with the efficacy of the Veterans Administration in the administration of enabling legislation, but rather with the broad question of whether such legislation is sound, whether the federal government should continue to engage in a gigantic medical care program in competition with private medical institutions and whether the ever increasing cost of such a program is a proper burden to impose on the taxpayers of the country A consideration of this problem must of course be predicated upon a concern for the health of the entire population and not just a particular segment Starting from this premise and with sympathetic concern for all interests involved, it is the considered opinion of your reference committee that the logic and conclusions of the Special Committee on Federal Medical Services submitted last December as reiterated and implemented by the report of the Liaison Committee should be adopted by the House of Delegates Without restating the statistical data or the reasoning set out in these two documents, your committee would like to repeat their recommendations, which provide

'Part One—Your Committee recommends with respect to the provision of medical care and hospitalization benefits for veterans in Veterans Administration and other federal hospitals that new legislation be enacted limiting such care to the following two categories

- (a) Veterans with peacetime or wartime service whose disabilities or diseases are service incurred or aggravated, and
- (b) Within the limits of existing facilities to veterans with wartime service suffering from tuberculosis or psychiatric or neurological disorders of non service-connected origin, who are unable to defray the expenses of necessary hospitalization

"Your Committee recommends that the provision of medical care and hospitalization in Veterans Administration hospitals for the remaining groups of veterans with non service-connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community, where it rightfully belongs

'The recommendation of the Committee with respect to the treatment of veterans with tuberculosis and neuropsychiatric

disorders of non service origin in federal hospitals is believed necessary at this time because of the inadequacy of local facilities designed to provide treatment for all such cases It is the feeling of the Committee, however, that the entire question of whether the care of these patients is a local or a federal responsibility must be reanalyzed by the Congress The rapidly expanding veteran population and the need for facilities for the remainder of our citizens afflicted with these diseases suggests that community facilities must be developed under state or local administration for the benefit of all Preferential treatment for veterans with these non service connected disabilities cannot be continued indefinitely, in view of its detrimental effect on the health and the economy of the entire nation "

In conclusion, your committee would like to stress the fact that these recommendations do not suggest any limitation or impairment of the hospitalization or medical care now available to veterans who have become physically handicapped as a result of military service Your committee is in complete accord with that program

Your committee also recommends most earnestly that all of the facilities of the American Medical Association and of its constituent state and component county societies be employed immediately to disseminate background information and accurate statistical data in this regard Every effort should be made to inform the profession and the public concerning the nature of the problem, the position of the American Medical Association and the reasons on which that position is predicated

REPORT OF THE COMMITTEE FOR THE STUDY OF RELATIONS BETWEEN OSTEOPATHY AND MEDICINE

The Board of Trustees received the report of the Committee for the Study of the Relations Between Osteopathy and Medicine, composed of Drs John W Cline, Chairman, E Vincent Askey, F J L Blasingame, Edwin S Hamilton, and Arch Walls The Board wishes to commend the Committee on its comprehensive study of the historical background and its thorough consideration of the data available from a variety of sources In accordance with the recommendation of the House of Delegates, adopted at its meeting in December, 1952, the Board of Trustees submits the report of the Committee at this time I should like the permission of the Speaker to call on Dr John W Cline, Chairman of the Committee, to read the report, after which I will state the recommendations of the Board of Trustees

Dr John W Cline, Chairman, presented the following report

The Committee—In 1951, the President of the Association reported to the Board of Trustees that the relations between medicine and osteopathy presented widespread problems involving a majority of the states to some degree He had believed previously that these problems were localized to certain areas but found in the course of visiting many states that this was not the case

The Board of Trustees appointed a committee to inquire into the matter and to confer with representatives of the osteopathic profession A number of informal meetings and one formal meeting were held The latter was attended by the ranking officers of the American Osteopathic Association

In his remarks to the House of Delegates in June 1952, the retiring President called this situation to the attention of the House of Delegates The representatives of the American Osteopathic Association had informed the committee of the American Medical Association that the curriculums of the colleges of osteopathy consisted mainly of courses in medicine and surgery and that the quality of instruction in these colleges could be improved if more doctors of medicine were willing to teach in these colleges The President further raised the question as to the validity of the classification of modern osteopathy as 'cultist' healing

The reference committee considering this report recommended and the House directed that a committee be appointed by the Board of Trustees to confer further with representa-

tives of the osteopathic profession when and if requested. The Board appointed a committee consisting of Drs E Vincent Askey, F J L. Blasingame, Edwin S Hamilton, Arch Walls, and John W Cline. Due to additional matters coming before the Board of Trustees at the Clinical Session in December, 1952, the Board appointed another Committee for the study of the Relations Between Osteopathy and Medicine. This committee was composed of the same persons and was directed to investigate these relationships and to report to the House in June, 1953.

The committee has gathered and reviewed considerable data derived from a variety of sources, including questionnaires sent to every state medical association and county medical society and to persons who receive the Secretary's Letter. The questionnaires were designed by the committee but were submitted to the Secretary and Assistant Secretary of the Association, the Director of Public Relations, the Secretary of the Council on Medical Service, the Director of the Bureau of Medical Economic Research, and the attorney of the Association for review, criticism of the content and phraseology, and additions and deletions. Others also were consulted. These conferences resulted in numerous changes in the original draft. The final questionnaires were, therefore, the product of many minds. An effort was made to phrase the questions simply but to make them adequate to provide the necessary information. A conscious effort was made to avoid "weighted" questions and terminology. The questionnaires were returned to and analyzed by the Bureau of Medical Economic Research. The associations of 36 states and that of the District of Columbia responded in time to be included in this study. Twelve did not reply. The questionnaires directed to county societies and individuals were less extensive but covered much the same material. The return was not as large as had been expected, but the pattern of replies followed that of the state associations fairly closely, although individual opinions often were at variance. The similarity of replies was sufficient to warrant the conclusion that the replies of the state associations represented majority opinion within the states. The following state medical associations replied: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Georgia, Illinois, Iowa, Kansas, Louisiana, Maine, Maryland, Massachusetts, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Jersey, New Mexico, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, Wyoming, and the District of Columbia.

In addition, a letter propounding certain questions was sent to the deans of the schools of osteopathy. One responded directly. A composite reply was furnished to the committee by the Conference Committee of the American Osteopathic Association at a meeting of the two groups in Chicago, May 15, 1953. The replies were placed in writing subsequently and forwarded to the Chairman. The committee renders this report.

Historical—Osteopathy was begun in 1874 by Dr Andrew Taylor Still, a practicing physician. He promulgated a concept that all "disease is the result of anatomical abnormalities followed by physiological discord," and that the "anatomical abnormalities" consisted of lesions of bones, joints, and their supporting structures. These, in turn, induced disturbances of nerve and vessel function that produced pathological conditions in other tissues. He inveighed against drugs, serums, vaccination, and "electricity, x radiance, hydrotherapy or other adjuncts." He believed that "Osteopathy is an independent system and can be applied to all conditions of disease," and that surgery should be advocated only "as a last resort." He said, "We believe that our therapeutic house is just large enough for osteopathy and that when other methods are brought in just that much of osteopathy must move out."

The original concept of Dr Still could be classified only as "cultist" healing. The only justification advanced in defense of it is that drug therapy of that day with few exceptions was not specific or very effective. The earlier schools followed the dictums of Dr Still. Some advocates adhered to them with religious fervor and became extremely bitter toward orthodox medicine as a result of the legitimate criticism made of the then osteopathic concept.

Since that time a great evolutionary change has taken place in osteopathy. It is difficult to trace the chronological course of this development and to document it with relation to time. Apparently no historical account exists. We were unable to find one and the American Osteopathic Association could not furnish us with a reference to one. A comparison of osteopathy at the turn of the century and at the present time, however, makes it obvious that such an evolution took place. In its effort to develop an orderly account of this change, the committee consulted books, periodicals, and numerous persons. It then propounded questions to the deans of osteopathic schools and the representatives of the American Osteopathic Association. In addition, the committee investigated the curriculum development and the legal requirements for licensure of osteopaths at various stages. Certain facts that establish a partial history were developed.

As pointed out previously, the early schools adhered to the drugless and "cultist" theories of Dr Still. Most of the six existing schools apparently began as institutions following these teachings. Some may have begun on a broader base, but all largely followed his theories. At some time all departed from this dogma and began to turn toward the pattern of medical schools. The exact time of the departure of each is difficult to ascertain.

The composite answer of the schools of osteopathy states that some aspects of drug therapy always were included in their teaching, but these were limited in extent. All schools instituted informal teaching of pharmacology prior to the listing of formal courses in printed announcements. We believe that pharmacology was included because the inadequacy of drugless therapy was recognized but that formal listing of such courses was delayed out of deference to the opposition of the so-called "old religionists" in osteopathy. One school gave informal instruction in drug therapy prior to 1913, and in that year offered formal courses in pharmacology and materia medica. Other schools followed this pattern, and in 1940 the last school made announcement of a formal course in pharmacology after having taught the subject for years without according it an official listing. As nearly as we can ascertain, pharmacology has been taught in one school for more than 40 years and in most, if not all schools, for more than 25 years. It has been taught on a formal and announced basis in all schools for periods varying between 13 and 40 years.

Another approach to documentation of the evolution of osteopathy is found in the history of licensure. The current extent of licenses will be discussed later. Differing types of examining boards exist. Some consist solely of doctors of medicine, some solely of doctors of osteopathy, and some are composed of both. In the last type, doctors of medicine usually, and probably always, predominate in numbers. In 1913, and perhaps as early as 1900, composite boards granted full licenses to practice medicine and surgery to osteopathic graduates. Since that time, doctors of osteopathy have become eligible to full licensure in a majority of states. In 1922, one state established by law entrance requirements and curriculum requirements identical with those required of medical schools, which had to be fulfilled prior to admission to examination for full licensure by the osteopathic examining board. The osteopathic board in this state is said to have maintained high standards since that date. One school qualified to meet its requirements in 1922, two by 1940, and the remaining three by 1947.

The Osteopathic Concept—The original ideas of Dr Still were mentioned earlier. As the evolution of osteopathy has taken place, the concept of osteopathy has changed. Concise definitions of modern osteopathy and the current osteopathic concept are difficult to find. One expression of the osteopathic concept is found in the following quotation: "Stated simply, the principles are (1) The normal body contains within itself the mechanisms of defense and repair in injuries resulting from trauma, infections and other toxic agents, (2) the body is a unit and abnormal structure or function in one part exerts abnormal influence in other parts, (3) the body can function best in defense and repair when it is in correct structural arrangements."

A modification of the foregoing is found in another source.

The statement, 'The body contains within itself the power to cure all of its curable ills,' is subject to certain qualifications, which must be applied to the patient under consideration. Some of these are: 1 The body must be in the best mechanical adjustment possible. 2 The body must have the most adequate circulation possible. 3 The body must have available, from food or medication, the required chemicals for proper function. 4 The body must have a physiological reserve to affect the necessary compromise with its environment. 5 The body must be relieved of all impediments to proper function. 6 The body must be relieved of all sociopsychological impediments which must be recognized and dealt with as effectively as possible." In addition, one encounters statements such as "Contrary to erroneous opinions of persons not acquainted with the basic principles of osteopathy, it has never been a drugless school of practice. Surgery and the use of drugs always have been included within its practice."

The committee reviewed a series of six articles relative to the osteopathic concept appearing in "The Forum of Osteopathy," a publication of the American Osteopathic Association, from March to August, 1952. These articles were based on statements by many individual osteopathic physicians, with editorial comment by the author of the compilation. The statements quoted are often somewhat contradictory and the author comments on the validity of the differing points of view expressed in them. Predominant opinion seems to stress that osteopathy encompasses the full field of medicine and that its present and future development depends on an attitude of acceptance of new theories and new methods of diagnosis and treatment of disease as the value of these methods is demonstrated.

Discussions with leaders of the osteopathic profession and teachers in their schools reflect some difference in points of view, but their opinions are almost unanimous that the only basic difference between osteopathy and medicine at the present time is the degree of emphasis placed on manipulative therapy. It is stated by some that manipulative therapy has not been subjected to critical evaluation and that thorough investigation of its value by trained clinical research workers in our medical institutions would be welcomed. There is an inference that such evaluation might exert great influence on the future of osteopathy.

As will be shown by an analysis of the curriculums of the colleges of osteopathy, medicine, as we understand the term, in its various branches probably occupies more than 90% of the instructional hours. The total number of clock hours of instruction in osteopathic schools is on the average about 25% greater than the corresponding time devoted to instruction in medical schools. The increased number of hours in the opinion of medical educators, is a disadvantage rather than an advantage, but demonstrates that the number of clock hours devoted to teaching of medicine in osteopathic schools is at least as great as that in medical schools.

Colleges of Osteopathy—There are six osteopathic schools currently operating in the United States. These are (1) Kirksville College of Osteopathy and Surgery, Kirksville, Mo., established in 1892, (2) College of Osteopathic Physicians and Surgeons, Los Angeles, 1896, (3) Philadelphia College of Osteopathy, Philadelphia, 1898, (4) Des Moines Still College of Osteopathy and Surgery, Des Moines, Iowa, 1898, (5) Chicago College of Osteopathy, Chicago, 1900, and (6) Kansas City College of Osteopathy and Surgery, Kansas City, Mo., 1916.

Some of the present schools have resulted from mergers of other schools and some have undergone changes in name similar to the evolution of some of our schools of medicine. The dates indicate the founding of the original school in continuous operation.

The organizational structure of the colleges of osteopathy is essentially identical. All are incorporated as nonprofit educational institutions governed by boards of trustees that appoint the administrative officers and the faculties. None are operated for profit. None are a part of or associated with universities or other colleges. None are tax supported. Finances are derived mainly from contributions by alumni and tuition fees.

A well-organized and vigorous campaign begun by the American Osteopathic Association in 1943 has collected over five million dollars. Some contributions come from private philanthropy. The United States Public Health Service makes grants to all schools for such projects as education in cancer and heart disease. The Navy and the Public Health Service have made some grants for research. One school derives minor support from the state for venereal disease and indigent care.

Faculties—Of 487 faculty members listed in the six colleges, 32 are recorded as having degrees of A.B. or B.S. with out additional degrees, 273 have the degree of D.O. only, 96 have both A.B. or B.S. and D.O. degrees, 13 hold M.A. or M.S. degrees only, 36 are listed as having M.A. or M.S. and D.O. degrees, 26 have Ph.D. standing, 10 are listed as having an M.D. degree, and 6 have the degree of D.D.S. Reports from the osteopathic colleges show that there are 15 doctors of medicine teaching in five schools at the present time. In some catalogs only the degree is listed. In others, however, the institution conferring it also is listed and almost all of the A.B., B.S., M.A., and M.S., and Ph.D. degrees so listed were conferred by well recognized educational institutions. Some of the M.D. degrees were granted by currently approved schools of medicine. Others were not. The great majority of the faculty members holding bachelor's and master's degrees alone and those with Ph.D. and M.D. degrees teach in the fields of basic science. Some with additional D.O. degrees teach in clinical fields.

Admission Requirements and Students—All schools require three years of preprofessional study of a grade leading to a baccalaureate degree in an acceptable university or college and the curriculum content of preosteopathic course requirements is the same as that for admission to schools of medicine. Analysis of data from all schools shows that 49% to 78% of the students enrolled in present classes hold the degree of A.B. or B.S. Degrees of M.A. or M.S. are not uncommon and an occasional Ph.D. is listed. Sixty-four per cent of all current students hold baccalaureate or higher degrees. The most recent classes show substantially higher figures. Many students have matriculated from teachers' or junior colleges but many from outstanding colleges and universities, some of which have medical departments. Among these Michigan, Missouri, Illinois, Minnesota, Wisconsin, Iowa, Kansas, Pittsburgh, Ohio State, Indiana, New York University, Washington University, the University of Washington and Northwestern contribute substantial numbers and Harvard, Yale, Cornell, and Columbia are represented. This proportion is progressively increasing and that from lesser institutions is decreasing. Some schools select students partially on the basis of aptitude tests.

Classes—The classes vary from 60 to almost 100 students each, depending on the school. The enrollments of the schools in 1952 varied from 240 to 368 and total 1921 students. Every state was represented. Enrollments reflected the geographical location of the school to some degree but the larger states and those with larger numbers of doctors of osteopathy and wider scope of licensure furnished the bulk of the students. The largest numbers had residence in California, Michigan, Pennsylvania, Missouri, Ohio, Texas, Illinois, New York, Iowa, New Jersey, Oklahoma, and Florida. A number of students came from foreign countries.

Curriculum—Review of the catalogs shows that the portion of the curriculum devoted to teaching of osteopathic theory and technique varies on a mathematical basis and is from 4 to 14% of the total number of clock hours. A breakdown of the courses, however, shows instruction in history taking, physical examinations, physical therapy, and rehabilitation sometimes included under osteopathic titles. On the other hand, osteopathic instruction is integrated with other clinical teaching. It is difficult to determine the exact number of hours devoted to osteopathic teaching in contradistinction to basic sciences and medicine in its various fields and the proportion of these hours to the total program. It is estimated that an average of more than 90% and perhaps 95% of the instructional hours are devoted to basic sciences, the fields of medicine, surgery, and obstetrics. These courses of instruction and the distribution of hours correspond closely to those of medical schools.

All colleges of osteopathy require four year courses. Most operate upon a semester system, but the quarter plan exists in some. The total clock hours vary from 5,044 to 6,526 in different schools and average 5,756 for all schools. The distribution of hours devoted to didactic, clinical, and laboratory instruction varies. The same is true of medical schools, but the impression is gained that somewhat greater emphasis is placed on didactic teaching in schools of osteopathy. In some schools, however, introduction to clinical subjects occurs early and is fairly extensive.

Quality of Instruction—The committee had no entirely satisfactory method of evaluating the quality of instruction in clinical subjects. Results of examinations in basic sciences in the states requiring such examinations prior to admission to practice furnish a reasonable basis on which to determine the quality of instruction in pre-clinical subjects. Twenty-one licensing jurisdictions require such examinations. In 1952, 3,263 doctors of medicine or medical students and 276 osteopaths or osteopathic students took basic science examinations. The ratio of osteopathic to medical candidates was about that of enrollments in schools of osteopathy to schools of medicine. Eighty-eight per cent of the medical and 84.5% of the osteopathic candidates passed the 1952 basic science examinations. This is in marked contrast to 1942, when 85.6% of medical and 55.4% of osteopathic candidates passed. In 10 years medical candidates showed 2.4% improvement in passing basic science examinations and that for osteopathic candidates was 29.1%.

The committee had one confidential communication bearing on the quality of instruction in colleges of osteopathy as compared with schools of medicine. While this was an indirect approach and incomplete answer to the question, it covered both types of schools on a wide basis. At the end of four years of schooling the average medical student had acquired more medical knowledge than had the corresponding osteopathic student. The margin was definite, but no mechanism existed to determine its extent. It must be recognized that there is variability in both classifications of school. This same source states that the performance of a considerable number of students in the best osteopathic schools is now superior to that of the students in some medical schools. The committee believes the quality of instruction in medical schools to be definitely superior to that of osteopathic schools. There is evidence that education in osteopathic schools is improving, but improvement is impeded by a lack of trained teaching personnel. This seems to be particularly true in the clinical fields.

Graduate Training—The American Osteopathic Association approves hospitals for intern and residency training. Seventy-six hospitals are approved for intern and 38 for residency training. The committee is not in a position to evaluate this training.

Number and Distribution of Osteopathic Physicians—There were 11,827 osteopathic physicians registered in 1952. Of this total, 207 were in Canada and foreign countries and 14 were in the service. There were 145 out of practice. There were 11,461 in practice in 48 states, the District of Columbia, Hawaii, and Alaska.

According to total number of licenses, osteopathic physicians were distributed principally in the following states:

California	1976	Iowa	472	Florida	278
Missouri	1120	New York	472	Kansas	227
Pennsylvania	1081	Illinois	416	Maine	215
Michigan	1062	New Jersey	358	Colorado	182
Ohio	629	Oklahoma	348	Wisconsin	160
Texas	531	Massachusetts	291	Washington	158

This, however, does not give a true picture of distribution with reference to population. Certain small population and sparsely settled states show greater numbers in proportion. Among these are Arizona with 96, New Mexico with 106, and West Virginia with 129. Some states with large populations show relatively small numbers of osteopathic physicians. Connecticut has 76 and Minnesota 92, and most of the southern states very few. Distribution in general tends to bear some relationship to population, geographical location, and particularly to the scope of state licensure.

Within the individual states distribution tends to follow population and trading centers much after the pattern of that of doctors of medicine. There are, however, many exceptions. As an example, certain areas in Missouri with low ratios of doctors of medicine to population show comparatively high ratios of osteopaths. The same is true of northern Maine and the upper peninsula of Michigan. There are widely distributed towns and rural areas in many states in which the only care of illness immediately available is by osteopaths or where they outnumber doctors of medicine.

Volume of Care Rendered by Osteopathic Physicians—There is no clear method of determination of the proportion of medical care rendered by members of the osteopathic profession. It is estimated that about 175,000 doctors of medicine and 11,400 doctors of osteopathy are in active practice in the United States. With this as the sole basis of computation, approximately 6% of the medical care of our people is rendered by osteopathic physicians.

Scope of Licensure and Administration—In some states the scope of licensure is clear. In others it is not. Courts in various states have interpreted identically worded statutes differently. In some the scope of license has not been adjudicated. This confusion is reflected in the state association, county society, and individual replies to the questionnaires.

The June, 1952, digest of state laws published by the American Osteopathic Association states that the graduates of the six schools of osteopathy are eligible to full license to practice medicine and surgery in the following states and the District of Columbia: Arizona, California, Colorado, Connecticut, Delaware, Florida, Hawaii, Indiana, Iowa, Kentucky, Maine, Massachusetts, Michigan, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming.

Licenses permit limited use of drugs but no major surgery in Arkansas, Georgia, Idaho, Louisiana, Minnesota, and North Dakota. Licenses permit only manipulative therapy in Alabama, Illinois, Kansas, Maryland, Mississippi, Montana, North Carolina, and South Carolina.

There is room for legal argument concerning the exact meaning of the law in certain instances, but this list corresponds fairly closely with the 1949 survey of the Michigan State Medical Society and with the informal opinion of the attorney of the American Medical Association. For the purpose of general consideration, it can be accepted as substantially accurate.

Most jurisdictions that grant unlimited licenses do so on the basis of the original license without additional requirements. In a number it depends on an examination identical with that for medical licensure and given by the medical licensing body. In some the date of graduation is a determining factor. In some states additional training and/or additional examination is required. In some states only one type of license is granted. In others limited and unlimited licenses both exist. In the country as a whole, the numbers and proportions of limited licenses are diminishing rapidly.

The educational standards of all osteopathic schools are now and for some time past have been such that their graduates are eligible to unlimited licensure in all states granting such licenses. Doctors of osteopathy tend to settle in areas in which unlimited licenses are granted. The scope of licensure in general has been gradually extended, and we are informed that the legislatures of several states have measures designed for this purpose under consideration at present.

The Public and Osteopathy—Eighteen state associations indicate that patients do not readily distinguish between doctors of osteopathy and doctors of medicine. Two were in doubt and two do not answer. Fifteen believe they do so. Ten associations believe public use of osteopaths is increasing, 20 that it is remaining static, and 4 that it is decreasing. In 20 states osteopaths participate in voluntary health insurance programs. In 25 they render care to injured workmen under industrial accident laws. They also serve in the Veterans Administration. There is permissive legislation allowing them to

serve in the armed services and the United States Public Health Service, but, as far as we know, none have been accepted

Postgraduate Education—In 19 states no opportunity is provided for osteopaths to obtain instruction in courses sponsored by state medical associations, county medical societies, universities, or hospitals. In 16, no answer is provided to the question. In two states osteopaths have access to courses given by state associations and county societies and by health departments in five

Relationship Between Doctors of Medicine and Osteopaths—It is considered ethical to accept patients referred by osteopaths in 23 states and unethical in 11. Consultation with osteopaths is considered ethical in 8 states and unethical in 24. Joint care of a patient is considered ethical in 8 states and unethical in 25

Twenty nine state associations believe the quality of instruction in osteopathic schools would be improved if doctors of medicine freely participated in teaching in them. Eight do not reply. Twenty nine believe the level of osteopathic practice would be improved if postgraduate courses were more readily available to osteopaths. Twenty two believe the over-all care of illness in their states would be improved if doctors of medicine freely participated in undergraduate and postgraduate osteopathic education. Three believe there would be no change. Three believe it would be lowered. Nine do not reply

If ethical restrictions of association between doctors of medicine and osteopaths were removed, 18 state associations believe the over-all care of illness would be improved. Seven believe there would be no change. Seven believe it would be lowered. Five do not reply

Fourteen state associations classify modern osteopathy as practiced in their states as "cultist healing." Twenty three considered it not to be "cultist healing" according to the definition of the Principles of Medical Ethics of the American Medical Association

Fifteen favor removal of ethical restrictions on voluntary association between doctors of medicine and doctors of osteopathy. Sixteen oppose such action. Five do not reply and one is noncommittal

SUMMARY

1 According to published statements, and in certain states by law, the requirements for admission to schools of osteopathy are the same as those for schools of medicine. In one school 78% of the students hold A B or B S degrees. The average for all six schools shows 64% possess baccalaureate or higher degrees. Only a small number of these degrees were achieved after admission to osteopathic school

2 The curriculums of osteopathic schools contain the same subjects taught in schools of medicine. Minor portions of the curriculums are devoted to osteopathic courses and manipulative therapy

3 The standard of education in osteopathic schools has improved materially in recent years. As far as this applies to basic sciences, the fact is demonstrated by the results of basic science examinations. It is far more difficult to evaluate the education in clinical subjects. Such information as is available indicates some but less progress in this field

4 The opportunities for doctors of osteopathy to obtain postgraduate training are meager

5 The state medical associations, the county societies, and individual physicians predominantly believe that the level of osteopathic education, the standards of practice, and the over-all care of the sick would be improved if doctors of medicine were able freely to participate in undergraduate and postgraduate education of osteopaths

6 This belief is shared by leading osteopaths and osteopathic educators

7 Doctors of osteopathy render medical and surgical care to a large but undetermined number of persons in this country. There is no way of ascertaining the exact number, but millions of patients are involved

8 The scope of the osteopathic license varies from limitation to manipulative therapy in 8 states to extensive or complete practice of medicine in 35 states. The trend is toward the extension of the scope of licensure

9 Majority opinion of medical associations and individual physicians indicates that the quality of medicine practiced by osteopaths is variable, and it probably differs in different states

10 Medical opinions of osteopathy naturally vary. It is scarcely possible to compare osteopathy in such states as Maryland and Wisconsin. In the former osteopathy is limited to manipulative therapy and in the latter the state board of medical examiners recognizes the six schools of osteopathy as approved schools of medicine. It is likewise impossible to compare osteopathy in Alabama, which has four osteopaths, to that in California, with almost 2000. Similar difficulties are encountered even in such adjacent states as Iowa and Illinois, Missouri and Kansas, and Texas and Arkansas

11 In 20 of the 37 states replying to the questionnaire doctors of osteopathy participate in voluntary health insurance plans, and in 18 of these in Blue Shield Plans. A few states specify that the basis of participation is not quite the same as that for doctors of medicine. In 1952, 6 of the highest 25 individual payments by Michigan Medical Service were made to osteopaths. Osteopathic hospitals and in some instances osteopaths are compensated by Blue Cross Plans

12 In 25 of the states reporting, doctors of osteopathy render care to injured workmen under the industrial accident laws

13 Twenty three of the 37 states replying consider it ethical for doctors of medicine to accept referred patients from osteopaths. Eight states hold it ethical to consult with and participate with osteopaths in the care of patients. In most states some physicians consider all three categories of association to be ethical

14 On the whole the states in which state association and individual opinions of osteopathy are highest are the states in which osteopathic licenses are unlimited or extensive. Where the scope of licensure is sharply limited or the osteopaths were few in number the opinions are less favorable

15 In many widely distributed towns and villages all or a large part of the immediately available care of illness is furnished by osteopaths

16 Public acceptance of osteopathy is extensive. Ten state associations report the use of services of osteopaths to be increasing, 20 that it is remaining static, and only 4 that it is decreasing. A large number of persons, through necessity, fail to distinguish between medicine and osteopathy or by choice receive their care of illness from osteopaths. Osteopaths serve in the Veterans Administration

17 Twenty three state associations classify modern osteopathy as practiced in their states as not being "cultist healing" according to the definition of our Principles of Medical Ethics. Fourteen consider it to be "cultist healing"

18 Fifteen state associations favor removal of all ethical restrictions on voluntary association between doctors of medicine and doctors of osteopathy. Sixteen do not

19 There is difference of opinion among osteopathic physicians as to the relative importance of and the place that manipulative therapy occupies in the treatment of disease. Some hold its position to be important and others to be minor. An increasing number, particularly of more recent graduates, disavow it

20 It is the opinion of the committee that the official viewpoint of the representatives of the American Osteopathic Association is that osteopathy includes the entire field of medicine and surgery but integrates manipulation of musculoskeletal structures with medical and surgical methods of therapy. No diagnostic or therapeutic procedure used in medicine or surgery is excluded

Osteopathy has undergone a process of evolution that has brought it to a point of such similarity to medicine that no marked fundamental differences exist between medicine and osteopathy. The entrance requirements for schools of osteopathy and schools of medicine are identical. The curriculums have the same content, except for the inclusion of osteopathic theory, diagnosis, and treatment. The period of instruction in both instances is four years. The clock hours devoted to teaching basic sciences, medicine, and surgery are as great in schools of osteopathy. The level of instruction in basic sciences is

demonstrated by the record of osteopathic candidates in examinations in these subjects. Indirect and incomplete methods of evaluation of the quality of instruction in clinical subjects, insofar as they apply, indicate progressive improvement in this field.

There are unquestionably doctors of osteopathy still in practice who explain disease on antiquated osteopathic theories and who rely solely on manipulative methods of therapy, but their number is constantly decreasing. It might be argued on this basis that osteopathy still remains 'cultist healing'.

Instruction in all fields of medicine and surgery has been given in some osteopathic schools for 40 years and formally in all osteopathic schools since 1940. Osteopathic teaching is integrated with these courses to some degree. It might be argued on this basis that "cultist" aspects remain. Nevertheless, the committee, after careful study and thoughtful consideration, is of the opinion that the teaching in osteopathic schools at the present time, and for some years past, does not constitute 'cultist healing' as defined in our Principles of Medical Ethics and that this stigma should be removed.

The committee believes that the level of osteopathic education and hence osteopathic practice would be raised if more doctors of medicine taught in schools of osteopathy and in postgraduate courses. This point of view is shared by a large majority of state medical associations. The only method by which this can be done is to eliminate the stigma of "cultism." As long as this stigma remains, most doctors of medicine will be reluctant to participate in the education of osteopathic students and in providing postgraduate education.

Doctors of osteopathy render medical care to millions of patients. The objectives of the American Medical Association and its responsibilities are to improve the health and medical care of the American people. The committee is of the opinion that these purposes would be served by making it possible for schools of osteopathy to draw on the services of doctors of medicine as teachers. We should assist improvement in the education of osteopathic physicians.

The committee believes that the American Medical Association should encourage state medical associations to aid in the improvement of osteopathic postgraduate education where the state associations find this desirable and feasible.

In view of the variation in the scope of osteopathic licensure by the states, probable variation in the level of osteopathic practice in different states, widely divergent opinions, and differing local conditions, the committee is of the opinion that any national policy governing the individual relationships of doctors of medicine to osteopaths would not apply equally to all states. In keeping with the autonomous nature of state associations and democratic principles, the responsibility for regulation of these relationships should be assumed by the several state medical associations.

The committee is of the opinion that the meetings it has held with the conference committee of the American Osteopathic Association have been productive of greater understanding between the two professions and a friendly approach to mutual problems. It would be wise to continue this type of liaison in the future. The committee also is of the opinion that it would be helpful for similar committees to be created on the state level where state associations find it desirable. Much public wrangling and acrimonious conflict might thereby be avoided.

In the past much publicity has been given to the prospect of amalgamation of the medical and osteopathic professions. While this may be an ultimate eventuality, there is no indication that it would be desirable or possible in the near future. Many years will elapse before differences of opinion and prejudices will be sufficiently resolved to make such a step possible.

RECOMMENDATIONS

The committee makes the following recommendations:

(1) That the House of Delegates declare so little of the original concept of osteopathy remains that it does not classify medicine as currently taught in schools of osteopathy as the teaching of 'cultist' healing.

(2) That the House of Delegates state that pursuant to the objectives and responsibilities of the American Medical Association,

which are to improve the health and medical care of the American people, it is the policy of the Association to encourage improvement in undergraduate and postgraduate education of doctors of osteopathy.

(3) That the House of Delegates declare that the relationship of doctors of medicine to doctors of osteopathy is a matter for determination by the state medical associations of the several states, and that the state associations be requested to accept this responsibility.

(4) That the Committee for the Study of Relations Between Osteopathy and Medicine or a similar committee be established as a continuing body.

Respectfully submitted,
JOHN W CLINE, Chairman
E VINCENT ASKEY
F J L BLASINGAME
EDWIN S HAMILTON
ARCH WALLS

The Board of Trustees makes the following recommendations with reference to the report just read. Because of the length of the report and the controversial nature of the subject, the Board feels that the House should have adequate time for its study and that the state associations should have opportunity to express their opinions. Therefore, it is recommended that the committee be continued but that action on the report be deferred until the June, 1954, Session.

It is suggested that at that time the House be prepared to answer the following questions:

- 1 Should modern osteopathy be classified as cultist healing?
- 2 Since the objectives of the American Medical Association include improvement in undergraduate and postgraduate education should doctors of medicine teach in osteopathic schools?
- 3 Should the relationship of doctors of medicine to doctors of osteopathy be a matter for determination by the several state associations?

Majority Report of Reference Committee on Miscellaneous Business

Dr. Walter P. Anderton, Chairman, presented the following majority report, signed by himself and Drs. Frank H. Krusen and Charles H. Phifer, which, after presentation of a minority report and extended discussion, was adopted.

We, the majority of the Reference Committee on Miscellaneous Business, recommend the adoption of the Supplementary Report of the Board of Trustees on the report of the Committee for the Study of the Relations Between Osteopathy and Medicine. The resolution introduced by Dr. J. Lafe Ludwig for the California Medical Association on the subject of osteopathy was considered with the supplementary report of the Board of Trustees on osteopathy, and it is our opinion that this resolution is covered by the supplementary report of the Board. A minority report from your reference committee will be presented.

It is our opinion that the committee of the Board of Trustees has made a great contribution in its Study of the Relations Between Osteopathy and Medicine. It is a splendid and constructive accomplishment, and requires complete knowledge, time, and very careful consideration in order that we may make no mistake in our recommendations and deliberations concerning it.

There are many differences in the types of licensure granted to osteopaths in different states. We would call to your very careful consideration the special committee's recommendations.

- 1 That the House of Delegates declare so little of the original concept of osteopathy remains that it does not classify medicine as currently taught in schools of osteopathy as the teaching of 'cultist' healing.
- 2 That the House of Delegates state that pursuant to the objectives and responsibilities of the American Medical Association which are to improve the health and medical care of the American people it is the policy of the Association to encourage improvement in undergraduate and postgraduate education of doctors of osteopathy.
- 3 That the House of Delegates declare that the relationship of doctors of medicine to doctors of osteopathy is a matter for determination by the state medical associations of the several states and that the state associations be requested to accept this responsibility.
- 4 That the Committee for the Study of Relations between osteopathy and medicine or a similar committee be established as a continuing body.

The Board of Trustees also recommends that action on the report be deferred until the June, 1954, session. It is suggested that at that time the House be prepared to answer the following questions:

- 1 Should modern osteopathy be classified as 'cultist' healing?
- 2 Since the objectives of the American Medical Association include improvement in undergraduate and postgraduate education, should doctors of medicine teach in osteopathic schools?
- 3 Should the relationship of doctors of medicine to doctors of osteopathy be a matter for determination by the several state associations?

It is our present belief that these recommendations are sound, constructive, and demand from the House of Delegates the usual evaluation and support it likes to give to reports of our Trustees. We cannot see any cause for emergency action. As members of the Reference Committee on Miscellaneous Business, we would like to move the adoption and concurrence with the recommendations of the Supplementary Report of the Board of Trustees on the Study of the Relations Between Osteopathy and Medicine.

Minority Report of Reference Committee on Miscellaneous Business

Dr. Robertson Ward, for himself and Dr. George A. Unfug, presented the following minority report:

This is a Minority Report of the Reference Committee on Miscellaneous Business. May I state that the signers of this minority report are in complete agreement with the remainder of the committee on all issues except that of the Supplementary Report of the Board of Trustees relating to osteopathy. On this we disagree in that we, the minority, recommend immediate adoption of the Report of the Committee for the Study of Relations Between Osteopathy and Medicine.

We of the minority of the Reference Committee on Miscellaneous Business are in complete agreement with the objectives and recommendations of the Committee for the Study of Relations Between Osteopathy and Medicine. We are of the opinion that it furnishes a sound and constructive approach to many perplexing problems. A large number of delegates and members of the Association appeared before your committee. With few exceptions they advocated immediate action and described varied and pressing problems in their states. In our opinion, there was fairly general agreement among those testifying that the action proposed in the report would be of material assistance to them in solving problems which cannot be solved under present conditions.

It was emphasized by some that their states looked to the American Medical Association for realistic leadership, and that, until positive leadership was provided, they would continue to be embarrassed in their efforts to solve their problems. We are of the opinion that such leadership should be provided as promptly as possible.

The purposes of the first and second recommendations of the report are the improvement of the health and medical welfare of the American people by assisting in elevation of educational standards in schools of osteopathy and postgraduate opportunities for doctors of osteopathy. This would result in improvement of the level of practice of medicine by osteopathic physicians to the benefit of large numbers of patients. This is in consonance with the announced objectives of the American Medical Association.

It is obvious from the report and the hearings before your reference committee that various states have widely different circumstances to meet and that no over-all national policy can guide the solution of the differing problems. We are convinced that the objective of the third recommendation in the report is to permit each state to solve its own problems without imposing on such states conditions that would be unfair and unworkable.

The only question between us and the signers of the majority report was one of timing. We believe that this House of Delegates is more conscious of the problems and far better informed than any other group in the profession. The facts as developed by the study presented to the House are clear. We doubt that additional information of importance could be developed in the next year except to corroborate the informa-

tion now available. We believe that there would be a number of important disadvantages in delaying action and that these outweigh any advantage to be gained by delay. In view of our general agreement concerning the recommendations of the report and the objectives to be attained, we recommend that the report of the Committee for the Study of Relations Between Osteopathy and Medicine be approved and its recommendations adopted at this session.

Supplementary Report of Board of Trustees—Continued

The following portions of the supplementary report of the Board of Trustees were not referred to any reference committee, the Speaker declaring that they were "for information only."

RELATIONSHIPS WITH NONPROFESSIONAL GROUPS IN THE HEALTH FIELD

In September, 1952, following the adoption by the House of Delegates of the report of the Reference Committee on Medical Education and Hospitals in June of that year, a joint committee of the Board of Trustees and the Council on Medical Education and Hospitals was appointed to study the whole question of the relationship of American medicine to professional nonmedical groups in the health field. Since that time, the committee has met with representatives of interested organizations and with individual physicians, teachers, and scientists. A preliminary report on these meetings was submitted to the Board of Trustees, but, because of the complex nature of the subject, definite conclusions have not as yet been reached. The Board has, therefore, authorized the committee to continue its study of the matter and has requested a further report for presentation to the House of Delegates in December, 1953.

RESOLUTION ON RELATIONSHIPS BETWEEN PHYSICIANS AND LAY TECHNICAL WORKERS IN AUXILIARY FIELDS OF MEDICINE

The resolution on the establishment of a permanent bureau in the headquarters office to deal with problems arising concerning the relationship between medical practitioners and lay workers in auxiliary fields of medicine, introduced by Dr. Frank H. Krusen at the December, 1952, session of the House of Delegates, was referred to the joint committee of the Board of Trustees and the Council on Medical Education and Hospitals appointed to study closely related problems. A report of progress was received from the above committee, but final action is deferred until after the joint committee has made its final report on the relationship of American medicine to professional nonmedical groups in the health field.

Address of Secretary of Department of Health, Education, and Welfare, Mrs. Oveta Culp Hobby

Dr. Louis H. Bauer, President, introduced Mrs. Oveta Culp Hobby, Secretary of the United States Department of Health, Education, and Welfare, who addressed the House as follows:

My grandmother would have viewed my presence at this assembly with some anxiety, if not with alarm. To her, a visit to the doctor, like the arrival of a telegram, meant a family emergency of the direst consequences. Had she learned that I was to consult some 200 physicians face to face, she would have concluded that my case was grave, if not critical. But I share the good health of millions of Americans whose well-being is both the result of splendid medical care under a private voluntary medical system and the result of the increasing resources for prevention and treatment of disease in medical practice today, a development associated with this voluntary medical system. This medical practice, founded on the doctor-patient relationship, has been advanced by tremendous medical discoveries, the introduction of new techniques and specialties, and improved professional education during the past two generations. Ironically, every advance of man seems to bring its own problems, the Greeks had a word for it, "cost of opportunity." A changing medical practice and a changing society have presented us with an embarrassing number of what are paradoxically problems of progress. It is the solution of these problems which now concerns us all.

I welcome this opportunity, especially, to consult with you, the nation's medical leaders, representing as you do the American Medical Association's 140,000 physicians and surgeons, on these common problems

There is little controversy on our objective—the best medical care possible for the people. It is the means to this end which raise the problems we face in achieving this purpose. One is the problem of supply. If we are to achieve our objective, the supply of medical care must be adequate and available to all the people. The second is the problem of using these medical resources under a policy which safeguards the traditional principles of our democratic American pattern.

In simple terms, the problems of supply we are facing include, first, problems relating to ways in which all the fruits of modern medicine can be brought within the reach of all the people. A vast array of new techniques of treatment involving costly equipment, costly medication, costly training, and the services of an army of ancillary personnel are now involved in the problems of modern medicine. Although the doctor-patient relationship remains dominant, it is no longer a simple relationship. It has been complicated by the introduction of new specialties and factors, as well as by new emphasis on prevention of disease and renewed responsibility for the total health problems of the patient against the background of his situation. Modern medicine is not only complex—it is expensive to supply. The second of these problems relates to meeting the cost of research underlying these medical advances and continued progress. The third broad problem relates to the supply of physicians in the face of mounting cost of education for the practice of this modern medicine. These, briefly, are our problems of supply.

In the use of our medical resources, we must first be careful to work within the democratic principle. Democracy is a doctrine of free will, grounded on the demonstrated ability of man to judge his own individual and common interest on the basis of his common human experience.

The freedom of man, therefore, to make his own choices in his 'life, liberty, and pursuit of happiness,' choices which no other man can make for him, is essential to human dignity, development, and progress. Hence, although man is a social animal and must act with his fellows to achieve the common goals of humanity, freedom and well being, his right to self-direction must be safeguarded, in such social action, by the establishment of the social controls involved only with his active consent.

The touchstones of democracy are "freedom," "consent," and "individual responsibility," not responsibility vested in an "elite" group with power to make choices and provide for the individual. One of the most significant phrases in our Constitution is the phrase "promote—not provide—the common welfare." In democracy, no one need walk alone, but he does his own walking. These simple propositions may be said to be the dialectics of the democratic private enterprise system.

Since we are committed to this democratic system as the system which creates the greatest opportunity for man's achievement of dignity and freedom, any policy which impairs this principle is regressive. The impairment of the principle of free choice and consent in medical care which is inherent in a compulsory program of medical care, therefore, represents a break in the fabric of our democratic system. This break occurs, moreover, in an area in which the value of the elements of "choice" and "consent" is intensified because of the very nature of the service involved. Under such a policy a long turn toward an authoritarian system would be made. The course of this social pathology is dangerously progressive and difficult to reverse.

It is clear that the democratic principle to which we are committed is not served by so-called socialized medicine. Such medical practice, moreover, not only violates the democratic principle of free choice and consent, but it is unsound from an economic point of view—the second principle involved in the use of our medical resources.

Democracy not only protects man's rights to free choice, and is the only system which creates these conditions of human

progress, it is the most economical form of social political organization man has yet devised. For when the government provides a service, the cost of a round trip ticket for the dollar from the tax payer to the government back to the tax payer must be paid. Hence, the interposition of the government between the doctor and the patient is expensive and the total resources for medical care, research, and education are at the last, reduced by the amount of this cost. This is the point which seems never to be fully recognized by those of socialist persuasion.

We now come to a third principle which must govern the use of our medical resources, equal opportunity for medical care, the heart of our over-all objective. While in the short run it might appear that socialized medicine may achieve this end, in the long run its involved and costly administration, its deadly effects on free inquiry and research, and its impairment of democratic rights to free choice ultimately defeat our long-view purposes of continuing medical progress and the maintenance of the high standards of medical care which the American medical profession has achieved for this country under a private voluntary system. "Equality" of medical opportunity becomes a hollow victory under these conditions.

In brief, universal medical care provided by the government not only threatens the democratic principle but is uneconomic and inherently self-defeating. It is not the way to the achievement of our objective—the best medical care and the highest level of national health possible.

Socialized medicine is not a satisfactory solution of our problem. What are the alternatives? As a nation we cannot afford to fail to make available the best medical care possible to all our people. We must find ways to resolve the problems we set forth earlier. This Administration is looking, first, to the physicians of the country for leadership in meeting this challenge, and we look with confidence.

The history of medicine is a record of devoted service to humanity. The American medical profession has long proved its devotion to these ideals. Its accomplishments constitute a proud record in medical history. The demands of today are only the continuing challenge in this long history of constant adaptation to a changing society, but never have these problems been more onerous and critical than today. I can put these issues no more clearly or forcefully than they were expressed by your illustrious President, Dr. Louis H. Bauer, in his monthly message to you in your Journal in February of this year. Dr. Bauer stated: "I am afraid that too many physicians are indulging in wishful thinking that the clock can be turned back and that we can again practice medicine as it was practiced 25 years ago, without involvement in all these socioeconomic problems. It is idleness to believe that. These problems are upon us, our whole way of life has been altered, and, whether we like it or not, we cannot close our eyes to it. If we fail to participate and lead in the solution of these problems, the solution will be taken out of our hands, and that solution will not be a happy one. No problem can be solved well if those most competent to advise hang back and ignore it. So it is up to those of us who are active in the affairs of medicine to educate our colleagues and to stimulate their interest in what may be termed the nonscientific aspects of medicine. Unless we handle these nonscientific matters properly, the scientific aspects will suffer, too." We think the American Medical Association will meet this challenge.

Second, this Administration looks to the individual citizen to meet his responsibilities by making full use of resources made available to him through modern medicine for the preservation of his health, by prudent participation in pre-paid plans for medical care, and by assumption of common responsibilities for the advancement of the health of our nation.

Again, we have faith that the individual citizen will meet this challenge. His understanding of the meaning of the questions involved, however, should be widened. Under any plan he pays. He should learn more about what his dollar buys under a compulsory program administered by the government and under a private, voluntary system and what his democratic rights mean to him.

Third, this Administration looks to the community acting both through its private voluntary associations and its governmental bodies, for help in meeting this challenge

We are all familiar with the tremendous role of private foundations in the advancement of medical science in this country. It has been estimated that in 1951, philanthropic foundations such as Rockefeller Foundation, Ford Foundation, Commonwealth Fund, New York Foundation, Russell Sage Foundation, Guggenheim Foundation, and many others, contributed \$10 million toward the support of medical research, voluntary health associations had contributed another \$10 million, and voluntary health agencies interested in specific diseases such as the American Cancer Society, Damon Runyon Medical Foundation, National Foundation for Infantile Paralysis, etc., had contributed another 10.6 million dollars in 1951 (Who Pays for Medical Research, *Medical Economics* 28:8 [July] 1951). The American Medical Association itself is one of these donors to causes of medical advancement.

Governmental bodies also carry responsibilities in working out plans of medical care which meet our conditions and achieve our objectives. As this whole speech indicates, the role of the government, particularly the Federal Government, is a basic question in our problem. This Administration believes that under a democratic system, the government has an important role to play. The broad framework of this government responsibility was defined by President Eisenhower in his State of the Union message last February when he said "First, the individual citizen must have safeguards against personal disaster inflicted by forces beyond his control, second, the welfare of the people demands effective and economic performance by the government of certain indispensable social services."

The Department of Health, Education, and Welfare has been created to discharge these responsibilities of the Federal Government. As the representative of this Department, I will briefly outline some of these responsibilities, which may be broadly defined as those functions which serve the health of the nation without affecting the doctor-patient relationship in medical practice.

The first area of concern is public health—prevention of disease, improvement of standards of sanitation in all areas, including food and drugs, assistance and consultations to local communities in establishing and maintaining health services, etc. The achievements of government at all levels cooperating with voluntary groups in advancing public health in these fields are too well known to recount, these are not areas of controversy.

Another appropriate area of government function is research. Although the achievements of private and voluntary organizations and groups in research have been phenomenal, the increasing scope of research, its cost, its basic and indispensable role in modern medicine make it a field in which government support is sought.

Other areas of governmental responsibility in medical fields not under the Department of Health, Education, and Welfare are responsibility for medical care and health of members of the armed forces and related responsibilities for such services to veterans.

Another area in which the Congress has assumed an obligation for medical care is in the rehabilitation program, the restoration of the disabled. This is one of the areas in which private and voluntary medical services have worked closely with government agencies with success and without prejudicing the principle of voluntary and private medical practice in a service administered by a government agency. This type of service is a development in democratic society for the community care of those who are unable to provide essential services for themselves, the medically indigent. This aspect of our problem is increasing and is becoming one of the underlying issues in this situation. Because of tremendous advances in medicine, people are living longer and the incidence of chronic disease is increasing. The implications of these facts, and the problems they pose, are well understood in this group.

There remains another area where the pressure of need is compelling a review of all possible methods of solution, and

that is the area of medical education, where the financial crisis is growing. A recent estimate of need for additional support by medical schools, based on data accumulated by the Association of American Medical Colleges, shows that schools need approximately \$20 million a year to meet current inadequacies. The medical profession has begun to contribute substantial sums (more than \$3,000,000 to date) to the National Fund for Medical Education, organized to meet this emergency. In May, the Fund reported that in addition to this money, corporate gifts amounting to \$570,882 had been received with an additional \$300,000 in sight. At best, only 10% of the amount needed is now available. There must be a renewed drive for voluntary support of medical education and increased support by local governments, for these problems of medical education cannot go unanswered.

The importance of government responsibilities in these areas is considered of such moment by this Administration that a position for a Special Assistant for Health and Medical Affairs has been set up in the Department of Health, Education, and Welfare. I know you are extremely interested in the appointment of this Special Assistant. I am sorry I am unable to announce that appointment today. During the past month, I have personally interviewed several outstanding candidates. At present, the FBI is securing full field checks on four men. Until I have these reports, I cannot forward my recommendation to the President. But when these reports are received, my recommendation will be forwarded to the President at once and the nomination of a Special Assistant will be sent to the Senate for confirmation. I am pleased to assure you that he will be a doctor of medicine.

In closing, let me quote again from your President, Dr. Bauer: "We can solve our difficulties if all contribute by sound thinking, by looking forward, not back, and by constant striving toward an ideal that we shall never reach, because we shall steadily increase that ideal."

We already have patterns of cooperation and joint action set by years of close partnership between the government, the people, and the medical profession. We can see the results of this partnership in every phase of our national health. We need only to push forward together to achieve a better health care for the people of the United States. We have the resources. We have the will. We shall surely find the way.

The audience rose and applauded at the conclusion of Mrs. Hobby's address.

Introduction of Mr. A. Leslie Hodson

Dr. Dwight H. Murray, Chairman, Board of Trustees, introduced Mr. A. Leslie Hodson of the legal firm of Kirkland, Fleming, Green, Martin and Ellis, Chicago, stating that Mr. Hodson has served the Board of Trustees as legal consultant for the past two years and that his services were available at this meeting of the House of Delegates particularly for any consultation desired by reference committees.

Report of American Medical Education Foundation

Dr. Elmer L. Henderson, President of the American Medical Education Foundation, presented the following report, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

I want first to thank the House of Delegates for affording me the opportunity to present a report on the progress that is being made by the American Medical Education Foundation in its effort to give financial assistance to the nation's medical schools. The Foundation's program to carry on a campaign at the state and local level through the medium of volunteer committees was adopted in the early part of 1952 and is still in effect, since it seemed wise to continue the grass roots approach as long as the present level of contributor returns continues. In 1951 we raised a total of \$745,000 from 1,876 contributors, from January to December, 1952, we saw that amount increased by \$151,000 to a total of \$906,000. The number of contributors grew from 1,876 in 1951 to 7,259 in 1952, an increase of 287% over the previous year.

The Foundation has transferred in excess of \$1,650,000 to the National Fund for Medical Education and, in turn, that organization has made grants to the nation's 79 approved medical schools of more than \$2,918,000. The medical profession provided approximately 50% of the total dollars disbursed in the grants to our medical schools. The Foundation will make another transfer of funds to the National Fund on June 30, which we have every reason to believe will exceed one million dollars. This will bring the total raised and transferred to over \$2,650,000 during the 30 months that the Foundation has been in operation. In 1953, as in the previous year, we have set a goal for our efforts of \$2 million dollars, and we are extremely hopeful that as the year progresses we shall see that goal attained. The goal is a realistic one that will enable the medical profession to carry its share of the National Fund's goal of 10 million dollars, which will give the needed stimulus to business and industry to bring in the remaining 8 million dollars.

As you already know, the Trustees of the American Medical Association again voted a half million dollar grant to seed the 1953 campaign. This is the third such grant and raises to \$1,500,000 the money given to the Foundation by the A. M. A. I am happy to report that the majority of the states are now engaged in active campaigns to put this program across. Some of the state campaigns are in progress at this time, and others will be carried on toward the last months of the year. In general the picture is very gratifying on all fronts.

At this time, I want to point out certain state efforts that have proved beyond much doubt that the cause is worthy and, when taken to the individual will receive support. Illinois leads all states in the total sum contributed by its members, having voted an increase of \$20 in the state society dues to go to the Foundation. Indiana, Pennsylvania, Nebraska, and Colorado also did outstanding work in their state campaigns. Nebraska was perhaps the outstanding state effort, despite the fact that Indiana led them in both dollars and total contributors. Under the leadership of Dr. L. D. McGuire of Omaha, in a 30 day period Nebraska raised \$49,146 in cash and obtained almost \$33,000 in pledges, payable over the next two years by the personal contact system. This from a state having a doctor population of 1,300 is certainly proof positive that if the Foundation's program is taken to the doctor by the leaders in his profession, he will respond. It also leaves little doubt that the doctor wants to keep the medical schools academically free and financially solvent.

It is too early to make an accurate appraisal of the results of the various state campaigns for this year. However, when we look at the existing income figures, we have no qualms about saying that excellent progress is being made. The Foundation received during the first five months of this year \$140,000 more than it had received from individual contributors for the same period in 1952. Including the half million dollar American Medical Association grant, the Foundation has received \$761,670 from 10,436 contributors, and you will be happy to hear that the contributors exceed 1952's total by more than 3,100, with seven months remaining in the current campaign year.

We have made very substantial progress, but we cannot relax our efforts if we are to attain the 2 million dollars which has been set for the profession. There is ample time for you to return to your home states and take an active part in raising this much needed money, and, before you find other pursuits to occupy your time, may I relay to you this word of advice from President Eisenhower, who, in a recent letter to the leaders of the National Fund for Medical Education, said, 'Private support of higher education in America is fundamental to the democratic tradition. American business and the medical profession must assume a greater share of the operating costs of our medical schools or they shall have no recourse but to federal subsidy—a perilous alternative.'

Gentlemen, we cannot assume because there has been a change of administration in our federal government that the threat of federal subsidy of our medical schools has passed—far from it. The Washington Office of this association in-

formed us earlier in the year that proposed legislation on this matter was probable during the current Congress. Now is the time for the medical profession to insure the future freedom of our medical schools by redoubling its efforts to make every member of the profession an active supporter of the Foundation. We have yet to meet the challenge squarely, and, until we do, most certainly we cannot expect American business to support this project wholeheartedly. I hope every member of this house will, if he has not already done so, contribute promptly and generously to the Foundation, and that he will make it his personal responsibility to return to his home state and take an active interest in the state effort. If you will do this, my report at this time next year will be one we can all be proud of, it will be a report of complete success.

Gentlemen, the eyes of the general public are upon us, and we can strike another blow at socialization by doing a successful job within our profession—providing the necessary funds to keep our medical schools free from financial worry and their teaching standards at the present high levels. If we fail, it could well be the 'foot in the door' that will allow the socialization of the medical profession and ultimately of our nation. I am sure that we will not allow this to happen, now or at any future date. It is not in the best tradition of our profession.

I would like to announce that every one of your officers and every member of your board of trustees has contributed to the fund this year, as in past years. I wish I could say that for the members of the House of Delegates, and I want you to know that we will be glad to receive any contributions from you during this meeting.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. H. Russell Brown, Chairman, submitted the following report, which was adopted:

Report of the American Medical Education Foundation Presented by Its President Dr. Elmer L. Henderson. Your committee has studied this progress report and commends the outstanding efforts and accomplishments of Dr. Henderson and his Foundation in their fight to maintain and preserve academic freedom in medical education. Your committee recognizes that unless this voluntary effort is continued to its ultimate success, undesirable solutions to the problem may result.

It has come to the attention of your reference committee that there exists widespread concern in our profession over the rising costs of medical education. Your committee believes that it is highly desirable to consider a long-range study of medical education in which all elements of our profession participate with equality of representation emphasized.

Presentation of Certificates from American Medical Education Foundation

Dr. Edwin S. Hamilton, member of the Board of Directors of the American Medical Education Foundation, announced the presentation of certificates—Awards of Merit—to organizations or individuals who had given \$1,000 or more during the past year to the Foundation, as follows:

American Society of Anesthesiologists
Utah State Medical Association
Southern Medical Association
Woman's Auxiliary to the Los Angeles County Medical Association
American College of Radiology
Woman's Auxiliary to the American Medical Association
Medical Association of Georgia
Connecticut State Medical Society
Medical Society of the State of New York
Mr. Lawrence Saunders, Saunders Publishing Co.
Dr. George F. Lull
Dr. Elmer L. Henderson
Dr. Elmer Hess
Dr. Gunnar Gundersen

Dr. Hamilton announced the presentation of a special Award of Merit to Mr. Russell F. Staudacher, first Executive Secretary of the Foundation.

(To be continued)

MEDICAL NEWS

ARIZONA

Personal—Dr William Paul Holbrook, Tucson, recently gave the annual Ralph Pemberton memorial lecture before a joint meeting of the Philadelphia Rheumatism Society and the Eastern Pennsylvania Chapter of the Arthritis and Rheumatism Foundation—Dr Lad R. Mezera, director of maternal and child health for the state department of public health, recently resigned to accept a similar position with the Kentucky State Health Department at Louisville—Dr David M Solomon, Phoenix, was recently named to membership in the state board of public welfare—Dr R Lee Foster, Phoenix, has been named editor-in-chief of *Arizona Medicine*

Maricopa Academy of Medicine—The Maricopa County Medical Society recently opened its new headquarters, the Academy of Medicine, at 2025 N Central St., Phoenix. The stucco structure, a former residence that has been remodeled, has offices, meeting rooms, a lounge, a 10,000 volume medical library, and employs a staff of 15. At the dedication services, Mr Fred Mitten, executive secretary, paid the following tribute to Dr Howell S Randolph, Phoenix, who was chairman of the library board in 1946, when the society adopted

Headquarters for the Maricopa County Medical Society

its library expansion program "The society owes a debt of gratitude to Howell Randolph. Without his vision and foresight the expansion fund would not have been established and it would not be possible for us to have our new headquarters today." The present library board consists of Dr Joseph Bank, chairman, Drs Randolph, Hayes W Caldwell, Fred W Holmes, and David C James, all of Phoenix. The Housing Committee, which arranged for purchase of the site, consisted of Dr G Robert Barfoot, chairman, and Drs Holmes, Paul B Jarrett, Hilary D Ketcherside, George G McKhann, and C Selby Mills, all of Phoenix.

CALIFORNIA

Pediatric Conferences—The University of California Medical School, San Francisco, will hold pediatric conferences, June 22-26. Fee, \$50. For information, write to Dr Stacy R Mettler, Head of Postgraduate Instruction, Medical Extension, University of California Medical Center, San Francisco 22.

Health Aspects of Survival—The third annual workshop on "Health Aspects of Survival" will be sponsored by the School of Public Health and the University Extension of the University of California, with the cooperation of the California

Physicians are invited to send to this department items of news of general interest for example those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

Office of Civil Defense and the Federal Civil Defense Administration, June 22 to July 3. Among the topics to be considered are medical and health services in civil defense, emergency medical care, epidemic diseases, defenses against biological warfare, health aspects of disseminated radioactivity, and the need for health education. Field demonstration will be given in medical care and rehabilitation of casualties, laboratory methods of disease control, techniques of instruction, experimental medicine, radioactive isotopes and atomic energy, and disaster operations. At the final dinner Thursday, 6:30 p.m., John Beeston, DPH, assistant professor of public health, University of California, Los Angeles, will speak on "London During the Blitz." The fee for the workshop is \$30. For further information write to the Department of Conferences and Special Activities, University Extension, University of California, Berkeley 4.

CONNECTICUT

University News—Dr Arnold D Welch has been appointed professor of pharmacology at Yale University School of Medicine, New Haven, to succeed the late Dr William Salter. Dr Welch has been chairman of the same department at Western Reserve University School of Medicine, Cleveland, since 1944 and is also chairman of the Committee on Growth of the National Research Council—Dr Norman A. Cameron, professor of psychology and psychiatry at the University of Wisconsin Medical School, Madison, has been appointed professor of psychiatry at Yale University—The recently completed West Haven Veterans Hospital, affiliated with the Yale University School of Medicine, has provisions for 340 general medical and surgical patients, 396 patients with tuberculosis, and 144 neuropsychiatric patients.

FLORIDA

University News—Dr Jacques S Gottlieb, formerly professor of psychiatry, State University of Iowa College of Medicine, Iowa City, who was recently appointed chairman of the department of psychiatry at the University of Miami School of Medicine, Coral Gables, and director of the Psychiatric Unit of Jackson Memorial Hospital, Miami, will assume his new duties July 1. Dr Gottlieb, a charter member of the Group for the Advancement of Psychiatry, is chairman of the Committee on Research of the American Psychiatric Association.

ILLINOIS

Fifty Year Club—At a luncheon given during the annual meeting of the Illinois State Medical Society in Chicago, Dr Ernest E Irons, president of the Board of the City of Chicago Municipal Tuberculosis Sanitarium, was inducted into the 50 Year Club.

Institute for Public Health Officers—The Illinois Association of Medical Health Officers and the Illinois Society for Mental Health will conduct an institute for public health officers of the local, county, and state health departments at Allerton Park, June 21-27, with the cooperation of the state department of public health and the state department of public welfare, which is financing the institute with funds available from the Illinois Mental Health Authority. The first of its kind in Illinois, the institute is planned to give key physicians in the state and local health departments an opportunity to explore the mental health implications of public health programs and thus further improve the effectiveness of the service of the health departments to their communities. Speakers for the institute are Drs Roger W Howell, professor of mental health, University of North Carolina School of Public Health, Chapel Hill, Edward M Thompson, Clinton, president,

Illinois Association of Medical Health Officers, Roland R. Cross, Springfield, director, Illinois Department of Public Health, Otto L. Bettag, Chicago, director, Illinois Department of Public Welfare, Harald M. Graning, Chicago, regional medical director, Region 5, U S Public Health Service, Nathaniel S. Apter, head, division of psychiatry, University of Chicago School of Medicine, Helen C. Coyle, Peoria, and Julius B. Richmond, superintendent, Institute for Juvenile Research, Chicago

Chicago

Meeting on Industrial Medicine—The Chicago Society of Industrial Medicine and Surgery will hold its annual meeting June 22, 8 p m in the Palmer House (room 18, fourth floor), under the presidency of Dr. George W. Bohr. Dr. Edward C. Holmblad, managing director, Industrial Medical Association, will present "Highlights of Los Angeles Industrial Health Conference," and Dr. Max S. Sadove, University of Illinois College of Medicine, will speak on "Anesthesia and Analgesia for the Emergency Patients." All persons of allied medical groups and especially members of the Chicago Medical Society are invited.

Don Anderson Appointed Dean at Rochester—Dr. Donald G. Anderson, Secretary of the A. M. A. Council on Medical Education and Hospitals since 1947, and formerly dean of Boston University School of Medicine, has been named dean of the University of Rochester (N. Y.) School of Medicine and Dentistry, effective with the opening of the 1953-1954 academic year. He succeeds Dr. George Whipple, dean since the founding of the school in 1920, who will continue to serve as professor of pathology. Dr. Anderson has been affiliated with the Boston City Hospital and Massachusetts Memorial Hospital in Boston, and St. Luke's and Presbyterian hospitals and the Columbia University College of Physicians and Surgeons in New York. He is secretary of the Committee for Survey of Medical Education and secretary of the Joint Committee on Medical Education in Time of National Emergency.

IOWA

National Cancer Award—With the recent presentation of the American Cancer Society 1953 Cancer Crusade Plaque and Citation to the Linn County chapter, Iowa became the first division of the American Cancer Society to win top national recognition three consecutive years for outstanding work in cancer control.

Institute of Gerontology—As an outgrowth of discussions by state leaders attending the first Iowa Conference on Gerontology, the State University of Iowa, Iowa City, has announced the creation of the Iowa Institute of Gerontology, which will serve as a research station and service center for the pooling of resources and work concerning the problems of Iowans over 65 years of age. The institute will also collect data in such areas as financial resources, employment, housing, recreation, family life, and religious expression, making such data available to all seeking information on these subjects.

MAINE

Centennial Session in Portland—The 100th anniversary of the Maine Medical Association will be celebrated at the annual convention in the Eastland Hotel, Portland, June 21-24. Dr. Eugene H. Drake, Portland, president, will open the public meeting at the City Hall Auditorium Sunday, 8 p m, at which Gov. Burton M. Cross will deliver an address and Dr. Thomas A. Foster, Portland, will give a historical sketch of the association. Monday at 9:30 a. m. the Maine Ophthalmological Society will conduct an eye clinic at the Maine Eye and Ear Infirmary, Portland. Tuesday and Wednesday, 9:30 a. m., there will be scientific clinic series at the Maine General Hospital, Portland (Dr. J. Robert Downing, Kennebunk, presiding), and Mercy Hospital, Portland (Dr. Ralph C. Stuart, Guilford, presiding). The luncheon meeting of the Maine Ophthalmological Section, Monday, 12:30 p m., in the Colonial Room, will be followed by an address on

"Newer Concepts in Glaucoma" by Dr. Paul A. Chandler, Boston. The Portland Medical Club will be host at a cocktail party Tuesday 5:30 p m., which will be followed by dinner in the Eastland Hotel ballroom. Dr. Harris P. Mosher, Walter Augustus Lecompte Professor of Otolaryngology and professor of laryngology, emeritus, Harvard Medical School, Boston, will speak on "My Creed," and Dr. Fred J. Pritham, Greenville Junction, will give "Memoirs of a Country Doctor." Dr. Ernest B. Howard, Assistant Secretary, American Medical Association, Chicago, will address the indoctrination meeting for new members at a luncheon Wednesday and will be guest speaker at the annual banquet at 6:30 p m., when his subject will be "A. M. A. Serves the Profession." The president's address will be delivered by Dr. Drake at the banquet.

MASSACHUSETTS

Program on Occupational Health—"Management Responsibility for Occupational Health" will be the subject of a special summer program at the Massachusetts Institute of Technology, Cambridge, June 22-26. The program, under the joint supervision of Dr. Dana L. Farnsworth, director of the M. I. T. medical department, and Dr. Harriet L. Hardy, head of the M. I. T. occupational medical service, will include industrial medical organizations and the supporting administrative relationships, effects of toxic chemicals, harmful dusts, and excess ionizing radiations, with methods of control, procedures for handling fire and explosion risks and personality factors involved in the relationships within industrial organizations. Such problems as the privacy of medical knowledge, medicolegal responsibility, management's interest in proper placement of very young and aging workers, and rehabilitation of younger injured workers will be discussed. Information may be obtained from the Director of the Summer Session, Room 3-107, Massachusetts Institute of Technology, Cambridge 39.

MISSISSIPPI

State Association Building—The Mississippi State Medical Association has opened negotiations for the procurement of land for a permanent, modern building in which the central office of the association will be housed. The proposed site is adjacent to the new medical school now under construction in Jackson.

MONTANA

Medical-Surgical Conference—The annual Cascade County Medical-Surgical Conference will be held at the Meadow Lark Country Club, Great Falls, June 22-23. Guest speakers will include Drs. Norman F. Miller, Arthur C. Curtis, and Albert C. Furstenberg, Ann Arbor, M. Digby Leigh, Vancouver, B. C., Canada, Wesley W. Spink, Minneapolis, and Arild E. Hansen, Galveston, Texas. There will be round table discussions both days. The banquet will be held Monday.

Personal—The Women's Medical College of Pennsylvania, Philadelphia, recently named Dr. Dora Von Holdt Walker of Great Falls as a member of its board to serve in an advisory capacity. Dr. Walker, who has practiced in Great Falls for 35 years, was the first woman president of the Cascade County Medical Society. She is the widow of Dr. Thomas F. Walker. A son, Dr. Thomas F. Walker Jr., also practices in Great Falls.

Society News—The Montana Academy of Oto-Ophthalmology recently elected Dr. Joseph C. LaPierre, Butte, president, and reelected Dr. Harvey L. Casebeer, Butte, as secretary-treasurer. —The Montana Obstetrical and Gynecological Society at its Spring meeting in Bozeman elected Dr. Stephen N. Preston, Missoula, to serve as president for a term of two years. Dr. Harold W. Fuller, Great Falls, was named president-elect, and Dr. Leonard W. Brewer, Missoula, secretary-treasurer. —At the recent meeting of the Northeastern Montana Medical Society, Dr. Joseph H. Williams, Culbertson, was elected president, and Dr. Henry J. Borge, Wolf Point, was reelected secretary-treasurer.

NEW YORK

Medal to Dr Snell—At the annual meeting of the Rochester Academy of Medicine, Dr Albert C Snell Sr, Rochester, a former chairman of the A M A Section on Ophthalmology, was awarded the Albert David Kaiser medal Dr Snell is the author of "Industrial Ophthalmology" and has published many articles in medical journals He is a past president of the Monroe County Medical Society and has served as secretary and president of the American Academy of Ophthalmology and Otolaryngology

Cerebral Palsy Institute—The third professional cerebral palsy institute for physicians, nurses, physical, occupational, and speech therapists, social service guidance workers, and teachers will be held June 29 to July 10 at Brooklyn College under joint sponsorship of the Coordinating Council for Cerebral Palsy in New York City and the speech and hearing department of Brooklyn College The program will feature related problems in the area of speech disabilities relative to persons with cerebral palsy Information may be obtained from Marguerite Abbott, executive director, Coordinating Council for Cerebral Palsy, 509 Madison Ave., New York

New York City

Dr Hetrick Retires as Dean—Dr J A Werner Hetrick, who has served the New York Medical College Flower and Fifth Avenue Hospitals as dean since 1941, and as president since 1942, has announced his retirement as dean, he will continue as president. Dr Hetrick served as registrar from 1925 to 1927, when he was appointed assistant dean and professor of otolaryngology In recognition of his services, the board of trustees and the faculty bestowed on Dr Hetrick the honorary degree of doctor of science at the 1951 graduation exercises Dr Ralph E Snyder, assistant dean of the college since 1951, has been appointed executive dean

Dr William Dock Honored—At a dinner at the Waldorf-Astoria, a portrait of Dr William Dock, professor of medicine, State University of New York College of Medicine at New York City, Brooklyn, was presented to the college and the Kings County Hospital by a group of his Brooklyn associates Dr Jean A Curran, dean of the college, and Dr Israel Magelaner, medical superintendent of the hospital, accepted the portrait The principal speaker was Dr William H Resnik, Yale University, New Haven, Conn Other guest speakers included Dr Tinsley R Harrison, Birmingham, Ala., Drs Chester S Keefer and Samuel A Levine, Boston, and Dr Perrin H Long, Brooklyn Dr Dock, who became professor of medicine at the Long Island College of Medicine, now State University of New York College of Medicine at New York City, in 1944, previously served as professor of pathology at Cornell University Medical College and at Stanford University School of Medicine, San Francisco

OKLAHOMA

Society News—Dr Gilbert L Hyroop, Oklahoma City, will be guest speaker for the Tulsa Academy of General Practice June 22, 8 p m at the Hotel Tulsa His subject will be Reconstructive Surgery of the Hand

New Alpha Omega Alpha Chapter—At the installation of the University of Oklahoma chapter of the Alpha Omega Alpha society in Oklahoma City, 26 men were initiated as charter members Dr Walter L Bierring Des Moines, Iowa, national president of the organization, presented the charter at a dinner in the Oklahoma Club

PENNSYLVANIA

Medical School Crisis Discussed by Business Leaders—Under the auspices of the National Fund for Medical Education, steps to mobilize private financial support in the Philadelphia area in behalf of the nation's 79 medical schools were recently discussed at a meeting of industrialists, business leaders, and educators, sponsored by Mr Francis Boyer, president of Smith, Kline & French Laboratories, Philadelphia This is the eighth of a national series in support of the fund's 10 million dollar solicitation campaign to overcome serious financial deficits facing the medical schools

Personal—Dr John B Levan, president of the Pennsylvania Heart Association, has been named chief of the cardiology department of St Joseph's Hospital, Reading Dr Levan also serves as assistant professor of medicine at the Woman's Medical College of Pennsylvania in Philadelphia—Dr C. Irvin Stiteler, Chester, who for 27 years served in the House of Delegates of the Medical Society of the State of Pennsylvania and for many years as editor of the *Bulletin of the Delaware County Society*, recently resigned his editorial post The county society presented him with a citation wrist watch as a token of appreciation for his services—Dr Henry R. Steadman, chief medical director of the Erie school system for 35 years, has announced his retirement, effective July 1 Dr Wilbur S Wallace, who served as his assistant for the past five years, has been named to succeed him

Pittsburgh

Dr McGibony Succeeds Dr Brooks—Dr John R McGibony, medical director, U S Public Health Service, has been named professor of hospital and medical administration in the University of Pittsburgh Graduate School of Public Health, succeeding Dr Glidden L Brooks, who has resigned to become medical director of United Cerebral Palsy on July 1 Before joining the Service in 1936, Dr McGibony served as chief medical officer and hospital administrator of the Indian agencies at Belcourt, N D, and Pine Ridge, S D, deputy state health officer for the North Dakota State Health Department, superintendent of the Phoenix (Ariz.) Sanatorium, and administrator for the Office of Indian Affairs in the Department of Interior, with administrative jurisdiction over 75 hospitals He became simultaneously director of health for the Office of Indian Affairs and hospital consultant, Hospital Facilities Section of the U S Public Health Service, subsequently being appointed assistant chief, Division of Hospital Facilities, a position he held until he assumed his present position in 1949 Dr McGibony, who is a hospital consultant to the National Security Resources Board and a faculty lecturer at the Naval Medical School, Bethesda, Md., is the author of "Principles of Hospital Administration"

WISCONSIN

Conference on Alcohol Studies—The annual Conference on Alcohol Studies, sponsored by the University of Wisconsin Extension Division, will be held on the campus at Madison, June 22-26 Participation is primarily for physicians, medical and health personnel, social workers, teachers, clergymen, police and parole officers, vocational rehabilitation workers, industrial personnel, and students Recent trends in treatment and research in alcohol and alcoholism, and methods of community organizations and educational institutions in dealing with the problem, will be discussed by authorities in the field from the University of Wisconsin, the Yale University Center of Alcohol Studies, state agencies, and national groups Information may be obtained from Prof J L Miller, Conference Director, 206 Extension Building, University of Wisconsin, Madison 6

State Laboratory of Hygiene—The State Laboratory of Hygiene, which originated in 1903 in a single small room in the basement of Agricultural Hall at the University of Wisconsin in Madison, recently dedicated its new \$1,125,000 building The laboratory, which is directed by Dr William D Stovall, conducts tests on some 170,000 specimens sent to it annually by physicians, veterinarians, public health nurses, sanitarians, and others throughout the state This compares with 7,000 tested in 1910 and 60,000 in 1928, when the laboratory was moved to the Service Memorial Institutes building Dr Carl N Neupert, director of the state board of health, presided at the dedicatory ceremonies Other speakers included Dr William S Middleton, dean of the University of Wisconsin Medical School, Dr Stovall, Dr Joseph C Griffith Milwaukee, president of the State Medical Society of Wisconsin, and Dr Leonard A Scheele, surgeon general, U S Public Health Service, who delivered the chief dedication address and spoke at the testimonial dinner tendered by the state society to Dr Stovall

GENERAL

Fulbright Awards Offered.—U S government awards (1954-1955) under the Fulbright Act have been announced for Austria, Belgium and Luxembourg, Denmark, Egypt, Finland, France, Germany, Greece, Iraq, Italy, Japan, the Netherlands, Norway, Pakistan, Sweden, and the United Kingdom and Colonial Dependencies. Application forms for university lecturing and postdoctoral research are obtainable from the Conference Board of Associated Research Councils, Committee on International Exchange of Persons, 2101 Constitution Ave., Washington 25, D C. Applications must be postmarked no later than Oct 15, 1953.

Traffic Safety Honor Roll.—The National Safety Council announces that, for going through the entire year 1952 without a single traffic fatality, 799 cities with more than 5,000 population have won places on the honor roll of its traffic safety contest. This is an increase of 52 from the number on the 1951 honor roll. The largest no-death city in 1952 was Evanston, Ill., with a population of 73,600. Hobart, Okla. (5,400 population) which has never had a traffic death since its incorporation in 1901, maintained its perfect record through 1952 for the longest sustained performance among cities of more than 5,000 population. Among cities of more than 10,000, top honors for sustained no-death records went to Belmont, Mass. (27,400), with a record of six consecutive death free years.

Fellowship Program for Israel.—Hadassah, the Women's Zionist Organization of America, Inc., recently announced the establishment of a \$500,000 medical fellowship program, designed to elevate the standards of medicine and science in Israel. The program will enable promising young physicians, nurses, and scientists to come to the United States from Israel to pursue intensive one and two year courses of study in their specialties in American institutions. Cooperating institutions are said to include the University of California, Yale University and Medical School, New Haven, Conn., Harvard Medical School, Boston, Beth Israel Hospital in Boston, Columbia University College of Physicians and Surgeons, New York, Cornell University Medical College and the New York Hospital, Johns Hopkins University and Medical School, Baltimore, and Rockefeller Institute for Medical Research, New York.

Fellowships in Radiation Therapy.—The American Cancer Society offers clinical fellowships in radiation therapy to properly qualified graduates in medicine who have already received thorough basic training in radiation therapy, and who wish further training in that specialty at certain clinics in the United Kingdom, the Scandinavian countries, and France. Fellowships are available to citizens of the United States who are graduates of recognized medical schools in the United States, who have previously received training in therapeutic radiology acceptable to the American Board of Radiology as credit toward certification, and who are under age 40. Priority will be given to physicians (1) who are already certified by the American Board of Radiology, (2) who have completed the required training in preparation for board examinations but who have not yet taken the examinations, and (3) who, while intending to complete board requirements and take the examinations, are still in the training period. The fellowship period will be one year, although in exceptional circumstances, and when not competing with new applications, renewal for one year or less will be considered. For information, write Dr. Brewster S. Miller, Director, Professional Education Section, American Cancer Society, Inc., 47 Beaver St., New York 4.

Meeting of American Orthopaedic Association.—This organization will hold its annual meeting June 29 to July 2 at the Homestead, Hot Springs, Va. Dr. James A. Dickson, Cleveland, will deliver the presidential address. Tuesday Monday at 6:30 p.m. the president's reception and cocktail party will be held, and at 9:30 p.m. "Movie Memories of A. O. A. Meetings 1947-1952" will be shown. Tuesday at 9:30 p.m. there will be movies on "The A. O. A. Returns to London" and "Movies of the Combined Meeting in 1952."

The golf tournament will be held Tuesday and Wednesday at 2:30 p.m. The annual banquet and ball will take place Wednesday 8 p.m. in the Empire Room. A paper on "An Experimental Study of the Effect of Cortisone on the Healing Process and Tensile Strength of Tendons" will be presented by invitation, Thursday, 9 a.m., by Dr. Richard N. Wrenn, Dr. J. Leonard Goldner, and Joseph E. Markee, Ph.D., Durham, N.C. Other speakers by invitation include Drs. William H. von Lackum, Robert Wylie, and James B. Jones, New York; Dr. Ernest A. Brav, San Francisco; Drs. E. Bruce Tovee and Frederick P. Dewar, Toronto, Canada; Drs. Louis E. Ward and Edward D. Henderson, Rochester, Minn.; Dr. Robert J. Joplin, Brookline, Mass.; and Dr. Thornton Brown, Boston.

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States, its territories, and possessions in the weeks ended as indicated:

CANADA

Society News—The Canadian Neurological Society will hold its annual meeting June 20-21 at the University of Manitoba Medical College in Winnipeg, under the presidency of Dr Jean Saucier, Montreal, Quebec. The scientific sessions will close Sunday with a symposium on neuropathies, 2:15 to 4:30 p.m. Seventeen other presentations are scheduled. The annual dinner will be held Saturday, 7 p.m. at the Royal Alexandra Hotel.

LATIN AMERICA

Meeting on Orthopedics and Traumatology—The Latin American Society of Orthopaedics and Traumatology and the Brazilian Society of Orthopaedics and Traumatology will meet jointly in Rio de Janeiro, Brazil, July 19-26. Symposia will be presented on scoliosis, reticuloendothelioma, fractures of the calcaneus, fractures of the upper extremity of the humerus, and arthroplasties with metal and acrylic prostheses. Courses will be given on surgical treatment of the paralytic foot, treatment of fractures of the upper extremity in childhood, recurrent dislocation of the shoulder, treatment of the paralytic pelvis and knee, and endocrine and metabolic bone disturbances. The new building of 'Clínica Ortopédica e Traumatológica' of São Paulo University will be dedicated after the meeting. For information contact the secretary of the meeting, Praça Floriano 31, 3º andar, sala 303, Rio de Janeiro, Brazil, South America.

FOREIGN

Exhibition of Plastic Arts—The Royal Netherlands Medical Association will hold an exhibition of plastic arts by physicians during the World Medical Association congress at The Hague Aug. 31 to Sept. 7. Physicians are invited to send paintings, drawings, sculpture, and illustrated books. There will be no space for industrial arts. For information write to Dr. A. Melchior, Raamsingel 4, Haarlem.

Irish Medical Association—The annual general meeting of the Irish Medical Association will be held in De La Salle College, Waterford, June 30 to July 4, under the presidency of Prof. Thomas G. Moorhead, Regius Professor of Physics, Dublin University. Medical films will be shown Tuesday, 4:30 to 5:30 p.m. Topics for discussion include antenatal care, antibiotics in general practice, and emergencies in general practice, medical, surgical, and obstetric. On Saturday there will be a visit to the new Regional Sanatorium at Ardkeen.

Radiological Congress—The International Congress of Radiology will be held at Monsted Hall, Copenhagen, Denmark, July 19-24. Subjects for the general meetings are 'Protection Against Ionizing Radiation,' 'Contrast Media in Diagnosis and Risks Associated Therewith,' 'Radio Resistance,' and 'Uniformity in Therapeutic Cancer Statistics.' Symposia topics include tomography, chemotherapy of cancer, diagnosis with high voltage rays, radioactive isotopes in medical therapy, angiocardiology, isotopes in biology, present status of radiotherapy in benign diseases, tumors of the lung, osteochondrosis of the spine, pathogenesis of leukemia, and cancer of the cervix uteri.

Funds for Medical Schools—The Rockefeller Foundation has appropriated \$500,000 to the American University of Beirut, Lebanon, for development of the university's medical division. The current grant will be available in sums of \$100,000 for every \$200,000 raised by the university from other sources during a five-year period that began March 1. The financial support of the foundation will go toward the first phase of a modernization program for the medical school, 12 full-time faculty positions in preclinical and clinical departments will be added to the school as soon as possible. The Indian Council of Medical Research has been given 550,000 rupees (approximately \$121,000) by the foundation for postgraduate medical fellowships. Over a three-year period the council will

help train additional Indian medical students to teach in India's medical colleges, adding 25 to the 26 trainees now supported annually. Ordinarily each fellowship will last for two years.

CORRECTION

Treatment of Methylrosaniline Poisoning with Fluorescein Solution—In the clinical note by Hosford and Smith on this subject, in THE JOURNAL, Dec. 13, 1952, page 1482, there appears an erroneous chemical structure of the salt formed by these two dyes. The correct chemical structure follows.

EXAMINATIONS
AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS *Parts I and II* All centers where there are five or more candidates June 22-24 and Sept. 8-10 (Part I only). Candidates may file applications at any time but the National Board must receive them at least six weeks before the date of the examination they wish to take. *Part III* June 9-26. Examination will be held in each of 31 centers having five or more eligible candidates. Exec. Sec. Dr. John P. Hubbard, 133 South 36th St., Philadelphia 4.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY *Written* Various locations July 16. Final date for filing applications was January 17. Sec. Dr. C. B. Hickcox, 80 Seymour St., Hartford 15.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY All candidates must now pass a written examination. *Written* Various centers Sept. 3. *Oral*, Philadelphia Oct. 16-18. To be eligible, candidate must complete 36 months of training before Oct. 1. Final date for filing applications was May 1. Exec. Sec. Miss Janet Newkirk, 66 East 66th St., New York 21.

AMERICAN BOARD OF INTERNAL MEDICINE *Oral*, San Francisco Sept. 28-30; Chicago Nov. 30-Dec. 2. The closing date for acceptance of applications for the San Francisco and Chicago oral examination was April 1. *Written* October 19. The closing date for acceptance of applications was May 1. Exec. Sec. Treas., Dr. William A. Werrell, 1 West Main St., Madison 3.

AMERICAN BOARD OF NEUROLOGICAL SURGERY *Oral* New Haven October. Final date for filing application is July 1. Sec. Dr. Leonard T. Furlow, Washington University School of Medicine, Kingshighway and Euclid Ave., St. Louis.

AMERICAN BOARD OF OPHTHALMOLOGY Chicago Oct. 5-9. *Written* Various centers January 1954. Final date for filing applications is July 1. Sec., Dr. Edwin B. DuPhy, 56 Ivie Road, Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY Chicago January 1954. Final date for filing application is August 15. Sec. Dr. Harold A. Sofield, 122 S. Michigan Ave., Chicago 3.

AMERICAN BOARD OF OTOLARYNGOLOGY *Oral* Chicago, Oct. 5-9. Sec. Dr. Dean M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PEDIATRICS *Oral* Ann Arbor June 26-27. Place undecided Oct. 9-11 (tentative). Indianapolis November. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PLASTIC SURGERY Final date for receipt of case reports for the fall examination (October-November) is June 1 of each year. Corres. Sec., Mrs. Estelle E. Hillerich, 4647 Pershing Ave., St. Louis 8 Mo.

AMERICAN BOARD OF PROCTOLOGY *Part II* *Oral and Written*, *Anorectal Surgery and Proctology* Philadelphia Sept. 19. Sec. Dr. Louis A. Buie, 102 110 Second Ave. S.W., Rochester Minn.

AMERICAN BOARD OF RADIOLOGY *Oral Radiology* *Röntgenology* *Diagnostic Roentgenology* *and Therapeutic Radiology* Chicago Dec. 6-11. Final date for filing application is July 1. Sec. Dr. B. R. Kirklin, 102 110 Second Ave. S.W., Rochester Minn.

BOARD OF THORACIC SURGERY *Written* Various centers throughout the country September 11. Final date for filing application is July 1. Sec. Dr. William M. Tuttle, 1151 Taylor Ave., Detroit 2.

WORLD CONGRESS OF THE WORLD CONFEDERATION FOR PHYSICAL THERAPY London England Sept. 7-12 Miss M. J. Neilson Chartered Society of Physiotherapy Tavistock House South Tavistock Square London WC1 England Secretary

WORLD MEDICAL ASSOCIATION The Hague Netherlands Aug. 31-Sept. 7 Dr Louis H. Bauer 2 East 103d St., New York 29 N. Y. Secretary General.

DEATHS

Randall, James Augustus ♂ Captain, U S Navy, retired, Coronado, Calif, born Nov 21, 1877, Atlanta College of Physicians and Surgeons, 1901, fellow of the American College of Surgeons, commissioned in the medical corps of the U S Navy June 26, 1903, prior to World War I served aboard the battleships Maine and Kentucky, at naval hospitals in the United States, and a two year tour of duty at the Naval Hospital, Canacao, Philippine Islands, during World War I served as the senior medical officer aboard the battleships Minnesota and Utah, and in September, 1919, was serving at the Naval Hospital in Philadelphia, attended War College at Newport, R I, and on two occasions served at the Naval Hospital, Washington, D C, on Jan 8, 1936, reported to the Fifth Naval District Headquarters as district medical officer and served there until Nov 28, 1939, from this assignment reported to the Navy Department as the president, board of medical examiners and naval examining board for officers of the medical corps, served in this assignment until Dec 1, 1941, having reached the statutory retirement age at that time, was placed on the retirement list of officers of the Navy, during World War II from July 24, 1943, to July 1, 1945, served on active duty as the officer in charge, Navy V-12 Unit, University of California, at Los Angeles, on Aug 2 1945, was released to inactive duty, died in the Naval Hospital, San Diego, April 23, aged 75

Barr, Robert Haynes ♂ Owensboro, Ky, born in Rome, Ky, Jan 24, 1902, University of Pennsylvania School of Medicine, Philadelphia, 1927, president of the Kentucky State Medical Association, secretary for one term and president for two terms of the Daviess County Medical Society, won a battle field promotion to colonel in the Army Medical Corps during World War II, for many years a member of the city board of education, and surgeon for the Louisville and Nashville Railroad, past president of the Chamber of Commerce, affiliated with Our Lady of Mercy Hospital and the Owensboro Daviess County Hospital where he died May 5, aged 51, of coronary disease

Paul, John Davis ♂ Philadelphia, born in 1891, University of Pennsylvania School of Medicine, Philadelphia, 1915, member of the American Society of Clinical Pathologists, formerly assistant secretary treasurer of the Medical Society of the State of Pennsylvania and secretary of the Philadelphia County Medical Society served in France during World War I, for many years affiliated with Misericordia Hospital and St Christopher's Hospital, on the staff of the Germantown Hospital and medical director of the Stetson Hospital, died in Eagleville (Pa) Sanatorium for Consumptives Feb 23, aged 61 of coronary disease

McNattin, Robert Franklin ♂ Chicago, Washington University School of Medicine, St Louis, 1928, specialist certified by the American Board of Radiology, member of the Radiological Society of North America, American College of Radiology, and the American Radium Society, formerly on the faculty of the Cook County Post Graduate School of Medicine and on the staff of the Cook County Hospital in 1946 named director of the then newly created cancer division of the Pennsylvania State Department of Health in Harrisburg, died May 9, aged 50

Telfer, Gavin James, Montrose, Calif, born in Detroit May 21, 1880, University of California Medical School, San Francisco, 1907, an officer of the U S Public Health Service in San Francisco during the plague control campaign of 1907-1908, served with the California State Department of Public Health for 28 years until his retirement in 1947 as senior epidemiologist, instrumental in the organization of many of the county health departments in California, died in Sacramento recently, aged 69, of intestinal obstruction and arteriosclerotic heart disease

Adcock, John Delbert ♂ Ann Arbor, Mich, University of Pennsylvania School of Medicine, Philadelphia, 1935, specialist certified by the American Board of Internal Medicine, assistant professor of internal medicine at the University of Michigan Medical School, at one time on the faculty of his alma mater, fellow of the American College of Physicians, member of the American Trudeau Society, affiliated with the University Hospital, died May 10, aged 44

Ahrens, Adolph Henry ♂ Sandstone, Minn, the Hahnemann Medical College and Hospital, Chicago, 1910, affiliated with St Luke's Hospital in St Paul and Sandstone State Hospital, died April 13, aged 71, of cerebrovascular accident

Allen, Edgar Dempsey, Crooksville, Ohio, Starling Medical College, Columbus, 1900, vice president of the Perry County Medical Society in 1922 and in 1937 and president in 1925, died April 12, aged 74

Allen, Francis Olcott, Secane, Pa, University of Pennsylvania Department of Medicine, Philadelphia, 1900, died April 13, aged 78

Baker, Albert Sherburne, Honolulu, Hawaii, Harvard Medical School, Boston, 1899, died Feb 22, aged 82

Barbee, George S, Zebulon, N C, University of North Carolina School of Medicine, Chapel Hill, 1910, died March 14, aged 66, of cerebral hemorrhage and hypertension

Barker, Vincent Leland ♂ Monroe, Mich, Indiana University School of Medicine, Indianapolis, 1928, past president of the Monroe County Medical Society, fellow of the American College of Surgeons, served in the U S Navy during World War II, on the staff of Mercy Hospital, president of the school board, died in Grace Hospital, Detroit Feb 28, aged 50, of ruptured aneurysm of the circle of Willis

Barnebee, James Hosea, Mission, Texas, Rush Medical College, Chicago, 1902, died March 31, aged 77

Bass, Rose Dina, East Orange, N J, Woman's Medical College of Pennsylvania, Philadelphia, 1926, served as treasurer of the New Jersey Branch of the American Medical Women's Association in charge of the venereal disease section of the Public Health Clinic in Newark for 15 years before his retirement in 1943, associate in the department of endocrinology at the Newark Beth Israel Hospital, died April 15, aged 50, of rheumatic heart disease

Bazell, David Louis ♂ Pittsburgh, University of Pittsburgh School of Medicine, 1911, died April 5, aged 66, of brain tumor

Beers, Charles William ♂ Muskegon, Mich, Detroit College of Medicine and Surgery, 1933, on the staffs of the Hackley and Mercy hospitals, died in Death Valley, Calif, March 28, aged 58, of coronary occlusion

Belzer, Laurence Melvin, Buffalo, University of Buffalo School of Medicine, 1912, served in France during World War I, affiliated with Deaconess Hospital, physician for the public schools, died in the VA Hospital March 20, aged 62, of arteriosclerotic heart disease

Bennett, James, Meridian, Miss, Hospital College of Medicine, Louisville, Ky, 1904, affiliated with Anderson Infirmary and St Joseph Hospital, died April 10, aged 80, of coronary artery thrombosis

Blue, James Howard ♂ Bessemer, Ala, University of Alabama School of Medicine, 1913, died March 10, aged 63, of an accidental gunshot wound

Caldwell, Burnie R, Coral Gables, Fla, University of the South Medical Department, Sewanee, Tenn, 1900, member of the Medical Society of Virginia served during World War I, died in the VA Hospital March 22, aged 75, of coronary occlusion

Carper, James Claibourne ♂ Baltimore, Howard University College of Medicine, Washington, D C, 1905, died in Washington, D C, Feb 23, aged 77, of carcinoma of the liver

Caster, John Leslie ♂ Los Angeles, University of Southern California School of Medicine, Los Angeles, 1944, member of the American Academy of General Practice, on the staffs of the Presbyterian and California hospitals, died in Balboa, Calif., April 2, aged 37, of coronary thrombosis

Collins, James Joseph ♂ Galena, Ill., Marquette University School of Medicine, Milwaukee, 1935, died in Mercy Hospital, Dubuque, Iowa, April 2, aged 47, of malignant hypertension

Cooper, Denton John ♂ Hillsboro, Ore., Minneapolis College of Physicians and Surgeons, medical department of Hamline University, 1903, member of the Montana Medical Association, died March 25, aged 81

Corrigan, John Edwin ♂ Excelsior, Minn., University of the City of New York Medical Department, 1892, fellow of the American College of Surgeons, died March 30, aged 87

DeLand, Charles Airmet ♂ Warren, Mass., Harvard Medical School, Boston, 1885, died in Worcester April 26, aged 93

Denny, Chester Hampton ♂ Creve Coeur, Mo., Washington University School of Medicine, St. Louis, 1927, served in the South Pacific during World War II, affiliated with Missouri Baptist Hospital in St. Louis, where he died March 21, aged 50, of coronary disease

DeNormandie, Robert L. ♂ Lincoln, Mass., Harvard Medical School, Boston 1902, specialist certified by the American Board of Obstetrics and Gynecology, member of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons, fellow of the American College of Surgeons, formerly medical consultant to the Maternal and Child Welfare Division of the Children's Bureau, U S Department of Labor, served on the staff of Waltham (Mass.) Hospital, died in Reading, Vt., April 20, aged 76, of coronary occlusion

Doupe, Rupert Gilpin, Sherman Oaks, Calif., Western University Faculty of Medicine London Ontario, Canada, 1915, died in Queen of Angels Hospital in Los Angeles, March 21, aged 62, of heart failure

Edlich, Theodore Julius, Manhasset, N Y., Cornell University Medical College, New York, 1902, formerly a pharmacist, died in Manhasset Medical Center Hospital April 24, aged 80, of bronchopneumonia and cerebral thrombosis

Fitzgerald, John Bertram ♂ Chicago, Northwestern University Medical School Chicago, 1928, associate in the department of surgery at his alma mater; specialist certified by the American Board of Surgery, fellow of the American College of Surgeons, medical officer during World War I, examiner for the Selective Service Board during World War II, on the staff of St. Joseph's Hospital, died April 26, aged 54, of acute myocardial infarction, arteriosclerosis, and chronic glomerulonephritis

Gaskins, Don Carlos, Bentonville, Ohio, Eclectic Medical College, Cincinnati, 1922, served during World War I, died in Harding Sanitarium, Worthington, Feb 24, aged 59

Hanson, Ralph ♂ Spokane, Wash. Rush Medical College, Chicago, 1890 served on the staff of the Deaconess Hospital, died April 4 aged 86, of diabetes mellitus and encephalomalacia

Hart, Benjamin Ide ♂ Bridgeport, Conn. Columbia University College of Physicians and Surgeons New York 1904, died April 9, aged 72

Heinrichs, Julius Clay ♂ St. Louis Missouri Medical College, St. Louis, 1899, affiliated with Christian Hospital, where he died March 29 aged 76, of bronchopneumonia

Hercik, William Louis, Chicago, College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois, 1910 died in the VA Hospital, Hines, Ill., April 3, aged 66, of hepatorenal failure

Jones, William McKinley, Chicago, Chicago Medical School, 1926, served during World War I, died April 21, aged 55, of coronary heart disease

Keith, Archibald Magruder ♂ Greenville, Ill., Kansas City (Mo.) Hahnemann Medical College, 1907, St. Louis College of Physicians and Surgeons, 1908, served as mayor of Greenville, died in the Mark Greer Hospital, Vandalia, March 9, aged 81

Kelly, Joseph Ignatius ♂ Burlington, Iowa, Keokuk Medical College, College of Physicians and Surgeons, Keokuk, Iowa, 1901, for many years company surgeon for the Burlington Railroad, died in Fort Myers, Fla., March 28, aged 80, of burns received as a result of the explosion of a gas stove

Klippel, Edward Theodore ♂ St. Louis, St. Louis College of Physicians and Surgeons, 1910, died in the Jewish Hospital March 11, aged 69

Kreutzer, Carl Robert, Salem, Ohio, University of Kolozsvar, Hungary, 1915, died in the City Hospital Feb 3, aged 64

Lampe, Albert Victor ♂ Philadelphia, University of Pennsylvania Department of Medicine, Philadelphia, 1907, died April 14, aged 74

Lemke, Albert R., Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1899, assistant surgeon for the Chesapeake and Ohio Railroad, served on the courtesy staff of the Henrotin Hospital, died May 11, aged 76, of cancer

Leslie, Lawrence Webb ♂ Chicago, Northwestern University Medical School, Chicago, 1948, served during World War II, died March 27, aged 28

Long, Arthur D. ♂ El Paso, Texas, University of Arkansas School of Medicine, Little Rock, 1909, member of the American College of Chest Physicians, died in Our Lady of the Lake Sanitarium, Baton Rouge, La., Feb 15, aged 69, of cardio-respiratory failure and asthma

Lyon, Paul Tiffy ♂ Chicago, Northwestern University Medical School, Chicago, 1903 on the staff of the Garfield Park Community Hospital, where he died May 6, aged 74, of cerebral hemorrhage

McLaren, Jennette Matilda ♂ Minneapolis University of Michigan Department of Medicine and Surgery, Ann Arbor, 1887, an Associate Fellow of the American Medical Association, died in Fairview Hospital April 5, aged 95

Modica, Charles, New York City, Loyola University School of Medicine, Chicago, 1936, also a graduate in pharmacy, on the staff of the Manhattan General Hospital, where he died April 4, aged 50, of pulmonary embolism and myocardial infarction

Murphy, Charles Edgar, Finley, Ky., Kentucky University Medical Department, Louisville, 1904, died April 12, aged 72, of arteriosclerosis and diabetes mellitus

Overholser, Charles ♂ Dayton, Ohio, Ohio State University College of Medicine, Columbus, 1911, on the courtesy staff of Miami Valley Hospital, where he died April 18, aged 75, of coronary occlusion

Pfaff, John Alfred ♂ Indianapolis Medical College of Indiana, Indianapolis, 1898 professor emeritus of gynecology at Indiana University School of Medicine, member of the staffs of Coleman, St. Vincent's General Robert W Long, and Methodist hospitals, died Feb 7 aged 83, of heart disease

Roberts, William Pusey, Phoenix, Ariz. Jefferson Medical College of Philadelphia, 1903, formerly practiced in Brooklyn, where for many years he was on the staff of the Prospect Heights Hospital, died Feb 26, aged 80, of heart disease

Rosen, Marks Julius, North Hempstead, N Y., University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1928 died Feb 23, aged 49, of myocardial infarction and diabetes mellitus

Truex, William Elmer, Syracuse, N Y., Syracuse University College of Medicine, 1911, died Feb 10, aged 69, of coronary thrombosis

Wagner, Adam Franklin, Greenville, Mo., Kentucky School of Medicine, Louisville, 1897, died March 25, aged 84

FOREIGN LETTERS

ARGENTINA

Congress of Industrial Medicine—The Second National Congress of Medicine and Social Assistance of Workers was held in Mendoza March 19-25. The congress was organized by the national secretary of public health. All the physicians of Argentina received an official invitation to take part in this meeting. The official program consisted of medical and social questions that were distributed for discussion by 14 committees. The principal discussion topics were assistance and social service for labor, the physiopathology of work and fatigue, forensic and social aspects of industrial medicine, rehabilitation, psychological technique and professional orientation, hygiene and security, preventive and social medicine and dentistry, sanitary statistics, medical care in industry, nutrition of workers, work of women and children, sanitary education, and economic problems in relation to workers. For 10 days the members of the congress attended congress meetings and public ceremonies, parties, promenades, banquets, and the traditional vintage festivities (Fiesta de la Vendimia) in Mendoza, principal center of the grape and wine industries in Argentina.

Changes in Medical Professorship—Without any previous announcement, Dr Juan P. Garrahan, professor of pediatrics, was dismissed from his position by the council of the medical school of Buenos Aires. No reason was given for this dismissal, and the official explanation was that, since Dr Garrahan had served in governmental offices in different capacities for more than 30 years, he deserved a retirement assignment. He is 59 years old. Dr Garrahan was a very efficient teacher, and many of the most outstanding young pediatricians were his pupils. His book on pediatrics is the official text in most of the South American medical schools. Some years ago, Dr Garrahan resigned his position of professor but the authorities of the medical school asked him to remain in his position. Dr Gonzalo Bosch, professor of psychiatry, was also dismissed after a long career in the medical school.

Physicians who have successfully fulfilled the university requirements for proof of ability and have been selected by special juries have not been appointed as assistant professors if they were not enrolled in the Peronista Party and had not signed a petition for the reelection of Gen. Juan Peron as president of the republic.

Overcrowding in the Medical School—More than 7,000 students have been accepted for the first course of the Faculty of Medicine of the University of Buenos Aires in 1953. More than 900 students are enrolled for the course in pathological anatomy. Practical teaching will be extremely difficult under these conditions. Many years ago the council of the medical school voted to limit the number of students to be accepted according to the adequacy of the teaching facilities. This decree has been rejected by the superior university council on the grounds that it is undemocratic. In the last few years many rules for the selection of students have been abolished. All selective and entrance examinations as well as all fees were recently abolished. Many persons are now accepted who have had no previous high school training, such as former army officers and teachers.

Anesthesiology—The secretary of public health of Buenos Aires has stated that from now on anesthesiology should be considered a specialty in its own right. For many years most of the largest hospitals have had departments of anesthesiology, and one municipal school of anesthesiology has been founded for the training of physicians and technicians in this special field.

COLOMBIA

National Congress of Neurology and Psychiatry—The first National Congress of Neurology and Psychiatry was held in Bogotá, Feb. 26 to March 1, 1953. The congress was organized by the Sociedad de Psicopatología, Neurología y Medicina Legal of Bogotá with the collaboration of the secretary of the Ministry of Hygiene. About 60 neuropsychiatric delegates of the departments of Antioquia, Bolívar, Cauca, Valle, North Santander, Atlántico, and Caldas, as well as all the neuro-psychiatric specialists in Bogotá, attended the congress. Dr A. Jiménez Arango, secretary of the Ministry of Hygiene and professor of neurosurgery of the Faculty of Medicine of the National University, was honorary president. Dr G. Uribe Cualla, professor of legal medicine and of forensic psychiatry of the Faculty of Medicine of the National University, and Dr J. J. Calderón Reyes were president and general secretary of the congress, respectively. Official topics were "Narcoanalysis," discussed by Dr Uribe Cualla of Bogotá, "Lobotomy" by Drs M. Camacho Pinto of Bogotá and L. C. Posada of Medellín, "Insulin Therapy" by Dr L. J. Sánchez, and "Psychiatric Legislation for Colombia" by Drs J. Asuad and H. Vergara of Bogotá. Drs Camacho Pinto and Posada reported the results of lobotomy in nearly 100 cases. Dr Sánchez, the head of the Hospital for the Male Insane in Bogotá, reported the results during the last 10 years with Sakel's insulin shock therapy of schizophrenia and other psychoses. Drs Asuad and Vergara pointed out the need for psychiatric laws in Colombia and proposed statutes and regulations to be used in neuropsychiatry. Among the scientific articles read before the congress the papers read by the delegation of Antioquia deserve special mention, particularly those of Drs A. P. Rodríguez Pérez, R. Londoño, and S. Castaño. Their papers dealt with the histology and histopathology of the nervous system and are the results of work carried on by the authors in the department of histology and neuroanatomy of the Faculty of Medicine of Medellín. These articles offered new viewpoints on the knowledge of the structure of the synapsis, the functional significance of neuroglia, and the mechanism of nervous conduction. The 32 scientific articles that were read before the congress will be published in a volume in the near future. The congress was a success, both because of the large number of neuropsychiatrists present and because of the excellent quality of the articles. The conclusions embody the establishment of proper steps for more unification of neuropsychiatrists and the preparation of laws to be used and the description of procedures to be followed in order to improve the services of mental hygiene and of psychiatric assistance in the country. The next congress will be held in Medellín in 1954.

National Convention of Surgeons—The Second National Convention of Surgeons was held in Medellín, April 12-18. The convention was organized by the Capítulo de Cirujanos de Antioquia, which is a branch of the Colegio de Cirujanos de Colombia, an affiliate of the International College of Surgeons. Official topics in the special fields of surgery and general surgery were as follows: in gynecology, surgical treatment of genital prolapse, in urology, surgery of the prostate, in pediatrics, surgery of harelip, in orthopedics and wound surgery, intramedullary nailing and surgery of the hip joint, in neurosurgery, surgery of pain, and in ophthalmology and otorhinolaryngology, surgery of cancer and of the sense organs. A large number of articles were also read. More than 157 surgeons from various regions of the country were present. Dr Gordon Gordon Taylor, the distinguished cancerologist of Great Britain, attended the meeting on a special invitation from Colombian surgeons. Some problems of professional interest were discussed, including the establishment of the Colegio de Cirujanos in certain regions of the country in which it has

not been as yet established. Simultaneously with the aforementioned meeting, the first meeting of the Médicos del Tórax (American College of Chest Physicians) was carried on with a special program.

Death of Dr G. Toro Villa.—Dr G. Toro Villa of Antioquia died Jan. 16, 1953, in Medellín, aged 74. He graduated from the Faculty of Medicine of the National University of Colombia and served as professor of parasitology, bacteriology, and tropical clinical medicine for almost 40 years in the Faculty of Medicine of the University of Antioquia. Later he became the dean of the faculty. He was a member of the *Academias de Medicina* of Bogotá and of Antioquia, the American College of Cardiology, and honorary president of the *Asociación Médica Antioqueña*. He published several interesting articles on jungle yellow fever in collaboration with Dr R. Franco and Martínez Santamaría, including the first description of this variety of yellow fever. He also published several articles on cardiology and tropical diseases.

Personal.—Dr J. del C. Acosta, of Colombia, was appointed president of the *Confederación Médica Panamericana* for 1953-1954. Dr Acosta is scientific director of the Hospital de San Juan de Dios of Bogotá, president of the *Academia Nacional de Medicina*, and president of the *Federación Médica Colombiana*. Formerly he was professor of obstetrics and dean of the Faculty of Medicine of the University of Bogotá. The next meeting of the *Confederación Médica Panamericana* will be held in Colombia in 1954.

ITALY

Surgical Treatment of Cancer of Uterus.—Professor Inguilla discussed the surgical treatment of cancer of the uterus at a meeting of the Filippo Pacini Medical Academy of Pistoia on Feb. 1. The main problem in surgical treatment of cancer of the uterus lies in the fact that this neoplasm invades the pelvic connective tissue early in the course of the disease, more rarely invades the lymph nodes of the pelvis, and only exceptionally diffuses outside the pelvis. Therefore, a surgical technique limited to simple removal of the uterus must be considered definitely unsuitable and contraindicated. On the other hand, only those surgical procedures that remove the connective tissue of the pelvis along with the uterus and possibly the pelvic lymph nodes should be considered.

Many years ago the Vienna Gynecological School elaborated two surgical techniques to be used in this condition, i. e., Wertheim's abdominal method and Schauta's vaginal method. Both these techniques aim at the simultaneous removal of the uterus and the pelvic connective tissue, with the abdominal operation, however, metastatic invasion of the pelvic lymph nodes may also be detected. For this reason many surgeons prefer the abdominal approach, although some have always supported the vaginal approach.

In Florence the vaginal approach has been used during the last two years, with a modification developed by the Viennese gynecologist Amreich. This technique permits more extensive removal of the pelvic connective tissue, and it has proved less painful for the patient than the abdominal method.

The problem of the lymph nodes, which is not solved with the vaginal intervention, has been dealt with in Florence by a second operation aimed at removal of the entire chain of lymphatic tributaries to the cervix uteri. With these two operations the problem of cancer of the cervix uteri is solved more completely than with either of the two classical methods of Wertheim and Schauta.

In the United States a few years ago Meigs elaborated a technique that is a significant improvement over Wertheim's abdominal operation. By Meigs' method the problem of the pelvic connective tissue and of the lymph nodes is solved simultaneously with one operation only. There is in the United States today a tendency toward surgical intervention in all cases, even in those in which the tumor has diffused to such an extent that there can be no hope for a definitive recovery. In such cases the operation provides the only possibility, however slight, of improvement and perhaps recovery. Because of

extension of the tumor, the surgeon may be compelled to remove the bladder and the rectum in addition to the uterus if they are invaded by the tumor. On the grounds that surgery offers the only hope for cure, it is understandable why in the United States surgical intervention is suggested for all cases of cancer of the uterus. The extent of the tumor and the general condition of the patient determine the best method to be used, which is always the most radical indicated. Only by following these criteria can the surgeon affirm today that he is really employing up-to-date surgical treatment of cancer of the uterus.

In the discussion that followed, Professor Facchinelli-Mazzoleni said that he was glad that tumors of the uterus were again being treated surgically but that radiotherapy should not be abandoned. To prove his point, he cited statistics on the results obtained with radiotherapy alone and showed how the results equal those obtained with the latest surgical methods. Radium therapy should always be combined with roentgen therapy, and the best results will be achieved in the cases in which there has been the best collaboration between the surgeon and the radiologist.

Professor Inguilla's conclusions leave the choice of surgical treatment by the vaginal or the abdominal approach open. The abdominal route permits a wide pelvic operative field and enables the surgeon to visualize all the parauterine connective tissue and lymph nodes. The abdominal route simplifies the mobilization of the ureters in the laterocervical segment in which this cancer is usually enclosed and compressed between infiltrated tissue. This stage of the operation, which must be considered of major importance in prolonged abdominal hysterectomy, is also made easier by the ligation of the two hypogastric arteries. The speaker, who always ligates these two arteries at their point of origin, has been able to decrease the mortality rate to 2.5% in the last 46 patients that he operated on. This, however, does not exclude the fact that the vaginal approach also has its indications, especially in patients with early cancer of the cervix uteri.

Diagnosis of Pulmonary Diseases.—At the meeting of the Medical Society of Mantua on Dec. 13, 1952, Professor Poltronieri discussed the importance of clinical, radiological, bronchographic, and bronchoscopic methods in diagnosis of pulmonary diseases and especially of neoplasms of the lung. Cancer of the lung is becoming more frequent and in most cases is bronchogenic. The clinical course depends on the location of the primary tumor and is manifested in two syndromes, that due to intrabronchial tumor and that due to extrabronchial tumor.

The first syndrome assumes the characteristics of bronchial stenosis, which, if complete, produces the symptomatology of pulmonary atelectasis and, if incomplete, that of expiratory emphysema. The second syndrome, which occurs when the tumor originates in the small terminal bronchi and expands into the surrounding pulmonary tissue, has the clinical characteristics of parenchymal thickening. On the basis of these distinctions, the speaker discussed the findings that can be seen during clinical, radiological, bronchographic, and bronchoscopic observations. After presenting serial roentgenograms of patients selected from a group of 30 with pulmonary tumors, Professor Poltronieri emphasized the necessity of an early tentative diagnosis of pulmonary neoplasm and early collaboration between the intern, the radiologist, and the bronchoscopist. This cooperation may by itself lead to an exact diagnosis and to early therapeutic intervention.

Mortality Due to Infectious Diseases.—During the first eight months of 1952 the deaths caused by infectious and parasitic diseases in the 25 Italian cities with populations of more than 100,000 numbered 4,935 as compared to 6,075 during the same period in 1951. The mortality rate for typhoid and paratyphoid increased from 178 to 197 cases, for tuberculosis of the respiratory tract it decreased from 3,768 to 2,530 cases, for the other forms of tuberculosis it decreased from 693 to 580, and for syphilis it increased from 282 to 314. According to the National Institute of Statistics, 237,469 males and 229,566 females died in Italy during the year, 7,903 more male than females died. From the November, 1951, census it appears that in Italy the female population exceeds the male population by about 1 million persons.

LONDON

B M A Annual Report of Council—In the recently published annual report of Council of the British Medical Association for 1952-1953 it was reported that the Queen has granted her patronage to the association, also it was recommended that at the next annual meeting of the representative body the Duke of Edinburgh be elected an honorary member of the association. Another recommendation that will be unanimously adopted is the election of Dr T C Routley of Toronto as president of the association for 1955-1956, to coincide with the joint annual meeting of the B M A and the Canadian Medical Association, which is to be held in Toronto in June, 1955.

A critical note is sounded in the council's comments on the reception accorded the report in "General Practice and the Training of the General Practitioner," prepared by a special committee of the association and published in 1950. This report was distributed to the 220 divisions of the association, but by last spring only 45 divisions had sent in any observations, and the representative body, at its annual meeting last year 'deplored the apparent apathy of the Divisions.' The remaining 175 divisions were sent another circular, asking for a statement as to what action the divisions had taken. The council now reports that 15 of these divisions sent in comments, 28 reported that they have no comments, and 36 mean to consider it at future meetings. This means that practically 100 divisions have not replied, a sign of little interest among the general practitioners of the country in the future of general practice.

Concern is expressed at the increasing number of actions for alleged negligence brought by patients against hospital authorities and members of their medical staffs. A complicating factor at the moment is the policy of the Ministry of Health that, in cases in which a hospital board or committee is to be made liable for the alleged negligence of a member of its medical staff, the board (or committee) should try and obtain a contribution from the practitioner concerned in respect of any damages awarded. In the words of the report, "This makes it difficult for hospital medical staffs to co-operate with their authorities as fully as they would wish, since by so doing they may furnish the authority with information that will subsequently be used against them in pursuance of the Ministry's policy." It is reported that discussions on this point are proceeding with the Ministry, and the hope is expressed that a satisfactory arrangement will soon be reached.

On the increasingly difficult problem of retiring ages, the council is hesitating. A resolution of the representative body last year drew attention to the discrepancy between the retiring age for consultants (65) and that for general practitioners (70) and expressed the view that this difference is contrary to national policy, 'which maintains that those over 65 should remain at work as long as they continue to carry out their duties efficiently.' To this the council replies that 'any general departure from the present agreed policy would be bound to have serious repercussions upon the prospects of promotion for junior members of hospital staffs, and in particular for the present body of senior registrars.' Membership of the association in the United Kingdom increased from 66,064 at the end of 1951 to 67,905 at the end of 1952, this represents 74% of the total profession and 84% of the working profession.

The council has rejected a petition for the formation of a group of medical hypnotists. Under the scheme for the exchange of members of the American British and Canadian medical associations five British physicians visited Canada and the United States during 1952-1953. The following paragraph speaks for itself: 'The Council in September, 1952, sent an invitation to the Presidency of the Academy of Sciences of the U S S R for six Soviet doctors to pay a good will visit to Great Britain. The reply received expresses thanks for the invitation and states that unfortunately it is not possible to send a delegation to this country at the present time.'

Indirect Methods of Advertising—As an appendix, the council published a revised version of its statement on indirect methods of advertising, which was first published in 1925. On the subject of broadcasting and television the association "accepts the view that medical practitioners who possess the necessary knowledge and talent should be permitted to

participate in radio and television programmes, provided they ensure the observance of appropriate ethical safeguards." Attention is drawn to the resolution adopted by the representative body in 1951, in which it was mentioned that 'practitioners approached to appear in such programmes, whether for 'sound' or 'visual' broadcasting, should insist on anonymity as part of the contract.' Anonymity for this purpose is now defined as 'withholding the publication or announcement of the practitioner's name, or any information, such as particulars of the appointments he holds, which might enable the public to identify him.' It is pointed out that, 'Unless a practitioner insists on anonymity he is not only offending against the ethical principles of the profession but is placing himself in danger of being accused of violating the Warning Notice of the General Medical Council,' i.e., being struck off the *Medical Register*. The possible development in Great Britain of commercial television lends importance to the statement that 'it is unethical for a practitioner to participate in sound or television programmes which are being presented for, or on behalf of, firms using sponsored radio as a means of advertising.'

It is considered to be a 'wise precaution' for a practitioner about to deliver a public lecture "to request the chairman beforehand to be circumspect in any introductory remarks concerning his status as a speaker. Special precautions are necessary when it is known in advance that a press reporter will be present." Before participating in discussion on medical matters in the lay press, practitioners 'must make it a condition of publication that laudatory editorial comments or headlines relating to the contributor's professional status or experience shall not appear.' Cautionary advice is given on the dangers of granting press interviews, and "A practitioner's photograph appearing in connexion with an interview or an article published in the lay press is a most undesirable form of publicity."

Survey of Prescribing—Prof D M Dunlop and his colleagues, of the department of therapeutics in the University of Edinburgh have published an analysis of 18,848 prescriptions, which is a 1% sample (approximately) of all National Health Service prescription forms issued in Scotland during the month of October, 1951 (*Brit Med J* 1:694 [March 28] 1953). Vitamins, tonics, and 'symptomatic remedies,' i.e., sedatives, hypnotics, analgesics, cough mixtures, stomachics, and laxatives, constituted 51.6% of all prescriptions written. Their comments on this are: 'A large proportion of these drugs must be prescribed as placebos. They are often relatively cheap in themselves, yet the total cost of compounding and packing them is relatively enormous. Thus, if the cost of prescriptions to the State is to be diminished it must be directed to a reduction of these symptomatic remedies as well as to extra vagant prescriptions of expensive drugs to which so much attention has been directed in the past.' The over all proportion of proprietary preparations was 30%. Bromides alone were prescribed very rarely, only 1% of prescriptions, however, concern is expressed that in combination with chloral hydrate they were prescribed on 40 occasions, which means that 4,000 such prescriptions must have been issued in Scotland during this particular month. Compound cough mixtures containing sedatives and expectorants were ordered as often as sedative preparations but purely expectorant cough mixtures were not ordered as often as either. The proportion of prescriptions for cough mixtures was higher in urban than in rural areas for instance, in the city of Aberdeen they represented 12.4% of prescriptions, compared with 7.7% in the remainder of this region, which is almost entirely rural.

Vitamins were prescribed more often than iron and constituted about 5% of all prescriptions. On the basis of the number of prescriptions for vitamins in this survey, it is estimated that over one million prescriptions for vitamins are issued every year. This, in turn, leads to an estimated annual cost for vitamin prescriptions alone in Great Britain of at least 2 million pounds. 'This estimate,' comments Professor Dunlop 'is intentionally a very conservative one,' and he goes on to say 'It is probably that only a very small proportion of the vitamin prescriptions representing this vast sum serve any very useful purpose.' When it is recalled that, owing to the present financial position of the country, health centres

cannot be built and that all hospital boards are being faced with serious difficulties as regards the staffing and general administration of their hospitals, these figures applied to vitamins alone, quite apart from other placebo prescriptions, deserve serious consideration."

In view of the relative incidence of pernicious anemia, diabetes mellitus, and heart failure, it is interesting to note that liver extract was ordered 125 times, insulin 97 times, and digitals 134 times. Even more curious is the fact that folic acid was ordered 32 times. "When it is recalled that this drug should be used only in tropical sprue and in some rare cases of megaloblastic anaemia, such as the megaloblastic anaemias of the malabsorption syndrome and pregnancy, and that it is absolutely contraindicated in pernicious anaemia some 3,000 prescriptions for it a month in Scotland would seem to be excessive."

Trichomonas Vaginalis.—Two contributions to the *Lancet* (1 668 and 698 [April 4] 1953) throw interesting sidelights on the perpetually recurring problem of the source of infection with *Trichomonas vaginalis*. F. Lanceley and M. G. McEntegart infected five volunteer male inpatients per urethram with 2 ml. of an inoculum containing about 2 million *T. vaginalis* per ml. To exclude nonspecific reactions due to the culture medium, five other volunteers were injected in the same manner with the same amount of sterile culture medium. None of this control group showed any evidence of urethral irritation or infection during the three weeks during which they were under observation. In three of the five infected with virulent *T. vaginalis* urethritis developed, from which the protozoa were recovered, in the other two a mild transient urethritis developed but no trichomonads were ever recovered during the three weeks the patients were under observation. Attention is drawn to the fact that 'examination of carefully taken urethral scrapings often revealed trichomonads when they could not be demonstrated by any other method. The importance of this technique both as a test of cure and in the investigation of suspected cases is evident, for it is almost certain that, so long as active protozoa persist, the patient can transmit the infection.' All showed evidence of a mild urethritis in the first 24 hours, but trichomonads were never found before the sixth to the ninth day after inoculation. This suggests that patients with non specific urethritis should be investigated for *T. vaginalis* on several occasions over a period of 7-10 days after the probable date of infection. Only one patient complained of symptoms, and these were trivial. In two of the patients a mild prostatitis developed and trichomonads were demonstrable in the prostatic fluid. The infection appeared to be self limiting, and the period during which protozoa could be found varied from 4 to 94 days. Examination of the serums failed to demonstrate an antibody to the protozoa.

According to W. McK. H. McCullagh, 13% of hospital gynecologic patients and 11% of private gynecologic patients in the London area are infected with *T. vaginalis*. If this figure applies to the whole of England and Wales, then there were 41,000 new cases last year, since there were 314,843 new gynecologic outpatients in England and Wales in 1952. McCullagh contends that the main cause of *T. vaginalis* infection is the ordinary lavatory seat. He points out that the trichomonads can live on a moist swab for days if kept warm and moist. On the inner front lip of a lavatory seat, it need not live so long to infect subsequent cases. The author was informed by the medical officer of health for a central London borough that in peak hours a toilet seat in a women's public lavatory may be used by up to 60 women in an hour. In support of his thesis he states that many patients first report for treatment after their return from a summer seaside resort, where they stayed in crowded boarding houses. Prevention, therefore, lies, he contends, in the mass adoption of the gap seat, particularly in girls' schools, railway stations, women's institutions, and lavatories for female hospital patients. He adds, 'Active interest on the part of the general practitioners and specialists in women's diseases would greatly aid medical officers of health in forcing through this much needed reform to introduce the non infecting lavatory seat. London will be crowded with visitors this summer, and action is needed now.'

PARIS

Congress for Angiology and Histopathology.—The first Congress for Angiology and Histopathology was held in Paris Oct. 14-16, 1952, under the presidency of Professor Cailliau. Abnormal capillary function was the principal subject. Burstein (Paris) read a paper on experimental pharmacodynamics and disturbances of vasomotor function. V. Jabonero (Oviedo) discussed the efferent innervation of the vascular walls. He explained that the autonomy of the nervous system of the vascular wall depends on the neural relay along the vessels, which, according to Leriche and others, makes the vascular nerve system partly independent of the central nervous system. The author used several staining techniques but got the best results with Masson's argentic technique performed at high temperature, followed by Cajal's technique performed at a low temperature.

B. N. Halpern (Paris) reported on abnormal capillary permeability. The importance of the problem derives from the fact that all fluid exchanges between tissues depend essentially on capillary permeability. Fluids pass unceasingly through capillary membranes in both directions, bringing nutritive elements to the tissues and removing the wastes of metabolism.

The permeability of a membrane by a given substance is expressed in terms of the amount of the substance that filters through a given surface unit of the membrane during a given unit of time under unvarying conditions of hydrostatic and osmotic pressures. According to Halpern, indirect measurement of this permeability is very difficult. In discussing the various forms of edema, he explained the difficulty of the problem. He compared the usual levels of protein in the fluid in several types of edema, which were as follows: in nephrotic edema 10 mg per 100 cc, in nephritic edema 40 to 60 mg, in nutritional edema 10 mg, in cardiac edema 30 to 50 mg, in Quinck's edema 310 mg and in acute pulmonary edema 300 to 600 mg. He stressed that it is difficult to explain these differences. The author believes that, when the protein content of edema fluid is high, a qualitative alteration of the capillary membrane and particularly of the intercellular substance, which loses its effectiveness, is to be assumed.

Lemaire, Loeper, and Housset (Paris) reported a study of the arteriolar and capillary circulation in man. They described a new photographic and plethysmographic method of measuring this circulation. The technique offers a double advantage: its field of exploration is limited only to the cutaneous arteriolar and capillary circulation and it allows the measurement of arteriolar blood pressure. In his report on arteriolar-capillary plethysmography, Jacquet (Reims) explained that this method permits obtaining accurate volumetric curves or curves of the variations of the arteriolar and capillary circulation. This method is of a special interest in peripheral vascular diseases, sclerosis, and arterial hypertension and in evaluating the prognosis with regard to drug therapy. The author stressed the good results obtained with cobalt (injections of cobalt benzenesulfonate) in these diseases.

Cachera and Darnies (Paris) reported a study on abnormal capillary permeability in hepatic disorders. They described a method of studying capillary permeability consisting of electrophoretic analysis of blood samples taken simultaneously from the control arm and from the one compressed during Landis test.

Repeated Massive Doses of BCG by Mouth.—It is well known that localized or generalized lymphadenopathy may occur when BCG is administered by scarification. Bretey, Gernex-Rieux, and Tacquet observed for several months a large number of patients with ulcerocaseous tuberculosis and with non-tuberculous pulmonary conditions to whom BCG was given orally in massive doses of 100 to 300 mg, up to a total dose of 1,600 mg. They recently reported the results of their researches before the National Academy of Medicine. The tuberculin reactions of the patients constantly diminished and the level of antibodies rarely increased. In no case has there been any localized or generalized lymphadenopathy. BCG given orally was found still active in the stools.

CORRESPONDENCE

TRAINING PROGRAM FOR COLLEGE HEALTH PHYSICIANS

To the Editor—About the middle of the 19th century, the need for a program to promote and preserve the health of college students was recognized by President Stearns of Amherst College, and Dr Edward Hitchcock of his staff was the first physician to develop a regular health service program in 1856. This program, as well as other early health service developments, was devoted largely to teaching hygiene and physical education, only a few colleges provided an infirmary for the care of students who were ill. With the turn of the century, the development of a balanced health service program began in many schools, with entrance physical examinations, preventive immunizations and inoculations, care of illness through outpatient and infirmary service, and general supervision by a physician of the health problems of all students.

In 1920, there was organized in Chicago an association of persons interested in student health problems. This was the American Student Health Association. The first meeting of that group was held Dec 31, 1920, in Chicago with 37 persons present and with 53 schools named as charter members. From that beginning, this organization, now the American College Health Association, has grown to an institutional membership of almost 300. It provides an official group through which persons and institutions engaged in student health service may work for the promotion of health, the prevention of disease, and the care of student illness.

During recent years, the many persons engaged in student health work in colleges and universities of the country have attempted to provide more medical and health supervisory services of the highest caliber. There has been a clearer awareness of the need for such services brought about, in part, by the publication of draft board findings in 1917 and 1918 and again in the 1940's. More important, however, has been the development of techniques and understanding in the field of preventive medicine, much of which is peculiarly adaptable to the age group of college students. Tuberculosis, infectious mononucleosis, appendicitis, and athletic trauma are a few of the health problems commoner in this age group than in other periods of life. It is in the postadolescent and early adult years that so many degenerative diseases begin. Health habits can be formed or in part made over by intelligent approach and instruction during these years. Emotional problems are common in this group and can frequently be prevented from developing into the neuroses and psychoses of later life. Diet and food fads are frequent and peculiar, and, in general, persons in the early adult group pay less attention to their health during this period of their life than at any other time.

These factors have led to the growth of a group of physicians who have devoted most of their time to serving as health officers in colleges and universities and who have become, in a sense, specialists in the field of student medicine. They are not specialists in the usually accepted meaning of the term. In fact, they are more than anything else general practitioners devoting their professional efforts to the student age group and its specific problems. Some of them have had special training before entering student health activities and have achieved recognition by one of the various specialty boards. Among them are internists, psychiatrists, and public health specialists.

All physicians who have devoted any considerable time to the field of student medicine have acquired certain special skills. They must be not only skilled physicians but also educators. They hold, in most schools by reason of their position and training, academic rank. They, therefore, combine the responsibilities of physician, teacher, and administrator and must be aware of the problems of the college and university in the field of health supervision, as well as the health problems of

the students under their care. Such a position can and should be one of the most important posts in the organizational program of any college or university. There are more than 6 million college graduates and more than 2 million college students in the 1,300 colleges in the United States today. About 16% of all men and women of the college age group are enrolled in college. It is assumed that these men and women will become the leaders of our country in every field of endeavor, and it becomes highly important that these leaders not only enjoy the best personal health possible but understand and appreciate the problems of providing good health for all persons.

If, during their college years, students receive good medical care and are instructed adequately in the preservation of health, the avoidance of bad health habits, and the development of an intelligent, positive, and constructive approach to the problems of health for themselves and for their families, much progress will have been made toward the solution of the general problems of medical care.

The American College Health Association has for many years believed that there is need for wider understanding of the scope and importance of the medical work being done in student health service units, particularly among the members of the medical profession. With this knowledge, many more physicians would undoubtedly find themselves attracted to the work and would become interested in learning how they might enter the field. The association has given much thought to this problem in recent years, and the following program has been devised in order to provide a means whereby interested physicians may take definite steps toward a career in student medicine.

The suggested plan consists of two programs. One has been planned primarily for the younger physician who is interested and who desires to enter the work after his internship or residency. Such persons, having had little or no experience in private practice, will spend two years in one or more universities building a background and understanding of the problems, philosophy, and requirements of student medicine. Emphasis will, of course, be on clinical work in the health service infirmary of the school in which they train.

The second program will be shorter and will last for one year. It is planned especially for the older physician who has had a wider experience in the practice of medicine and who needs only to orient himself in the field of student medicine. Physicians interested in this program will be those who for health or personal reasons desire to give up the rigors of private practice but who wish to continue active in their profession on a regular hour and salary basis.

The major part of the time of both programs will be devoted to clinical work. Other fields to be covered will be health service administration, hospital supervision, correlation of health service with problems of health education, the admissions office, dormitory supervision, environmental sanitation, medical social service, and general college administrative problems. The exact amount of time that will be spent in each area will vary with each school. In general, however, all subjects mentioned and possibly some others will be covered. The director of the health service at the institution at which the trainee enrolls will supervise the program.

In some of the universities, it is expected that arrangements can be made for interested trainees to combine their health service work with a formal program leading to a master's degree in the field of their choice. There should be little difficulty, for instance, in working out a program for a master of public health degree in universities in which the curriculum is available. Other possibilities will come to mind as the program is developed.

It is expected that the trainee will be considered a regular staff member of the health service in which he trains and that he will provide valuable service for the department in much the same manner as other staff members. He shall, therefore, receive regular compensation in accordance with the minimum established scale for similar work in the particular health service. Funds for this purpose will be provided from each health service budget and may be supplemented from scholarship or research funds, if available.

This in-service training program will be started in five universities in September, 1953. These first programs will be pilot studies and will be continued for several years before similar programs are made more widely available. It is desirable to know how the various types of curriculums work in practice, how satisfactory the service is to both the trainee and the participating university, what problems develop in relation to finances, what arrangements can be made to correlate degree programs, and how many physicians are interested.

At the annual meetings of the American College Health Association, the plan is that a certificate or diploma will be conferred on the trainees as they complete the program. The association receives numerous calls each year from universities and colleges asking for aid in finding a qualified physician for work in their health services. It is expected that physicians who undertake this in-service training program and who receive the certificate will be qualified for recommendation for such positions.

The five universities at which the program will be started in September, 1953, are Cornell University, Ithaca, N. Y.; the University of Michigan, Ann Arbor; the University of Minnesota, Minneapolis; the University of California at Berkeley; and the University of Kansas at Lawrence. Physicians interested in obtaining further information may write to any of the following persons: Norman S. Moore, M.D., Cornell University, Warren Forsythe, M.D., University of Michigan, Ruth Boynton, M.D., University of Minnesota, Ralph Canute-son, M.D., University of Kansas, William G. Donald, M.D., Ernest V. Cowell Memorial Hospital, Berkeley 4, Calif.; Dr. Edith Lindsay, secretary, American College Health Association, School of Public Health, University of California, Berkeley 4, Calif.; Dana Farnsworth, M.D., president, American College Health Association, Massachusetts Institute of Technology, Cambridge, Mass.; and Irwin W. Sander, M.D., director, Student Health Service, Wayne University, Detroit, Mich.

BULBAR POLIOMYELITIS

To the Editor—The article in the March 28, 1953, issue of *THE JOURNAL* (page 1099) entitled "Four Fatal Cases of Bulbar Poliomyelitis in One Family" deserves comment. The cause of death in patients with poliomyelitis is well known. They die of asphyxia from impairment of respiration. This impairment is due to weakness of the primary muscles of respiration, to obstruction of the airway, or to a combination of the two. Rarely is the respiratory center involved. In bulbar poliomyelitis, difficulty arises from obstruction of the airway, because of impairment of swallowing or paralysis or spasm of the vocal cords. With paralysis of the muscles of deglutition, the patient is unable to rid himself of pharyngeal secretions, and he aspirates them and is eventually asphyxiated.

The treatment of these conditions is well known. Tracheotomy should be performed, and the airway should be kept free of obstructing materials. If these measures do not produce sufficient ventilation, artificial respiration is given by means of the tank respirator. Oxygen should not be administered unless one is ready to perform a tracheotomy and use artificial respiration if the patient does not do well. The problem is not hypoxia, for that is relatively easy to treat, but rather hypercapnia, the retention of carbon dioxide and the develop-

ment of respiratory acidosis. It is well known that a carbon dioxide concentration of 5% in the blood will anesthetize the respiratory center. If the patient then continues to breathe, it is because of action of the accessory respiratory centers that lie in the carotid bodies and along the aorta. These centers are stimulated not by carbon dioxide accumulation but by oxygen deficiency. In view of these facts, administration of oxygen to a patient in whom the respiratory center is anesthetized, as in one with bulbar poliomyelitis, is a serious error in treatment, because it corrects hypoxia and, thereby, removes the sole stimulus for respiration. Also, it is disastrous to place a patient with secretional obstruction in a respirator without performing a tracheotomy beforehand, because the probability of aspiration of secretions into the lower respiratory tract is increased.

In the past seven years, over 8,000 patients with acute poliomyelitis have been treated in the communicable disease unit of the Los Angeles County Hospital. We have treated hundreds of patients with respiratory difficulty similar to those described in the article cited. Our mortality rate is 11%. In patients with bulbar poliomyelitis without involvement of the muscles of respiration, it is less. Our method of treatment was published years ago.

The children described in *THE JOURNAL* should have received an early tracheotomy, artificial respiration with the tank respirator, an indwelling nasogastric tube to relieve gastric dilatation, appropriate repair solutions of electrolytes, and blood and plasma as indicated after study of the blood pH, carbon dioxide combining power, potassium, sodium, chloride, albumin, and globulin values.

1200 N. State St., Los Angeles 33

INSECTS AND DISEASE

To the Editor—The letter in the May 2, 1953, issue of *THE JOURNAL* (page 77) by Dr. Frank C. Leeming, regarding the possibility of spread of poliomyelitis by fruit flies, recalled to mind a somewhat similar letter in an old medical journal. In an 1811 or 1812 issue of a journal no longer being published, there was a letter to the editor from a physician who set forth his observations on the relationship of yellow fever to the prevalence of mosquitoes. Unfortunately, little attention was paid to that communication, and it was many years and lives later that the cause of yellow fever was definitely established and the disease controlled. It is hoped that observations like Dr. Leeming's will induce a more intensive search for possible insect vectors of poliomyelitis.

MILKER'S NODULES

To the Editor—In the May 2, 1953, issue of *THE JOURNAL* (page 50) I noticed with interest an editorial on milker's nodules. The editorial refers to the apparent rarity of this disorder as evidenced by the few cases reported in the literature. While this is generally conceded to be a rare disorder, in the deep South it is not so rare as appears from the literature. I would like to call your attention to an article in the *New Orleans Medical and Surgical Journal* (97:13 [July] 1944). It adds more to the information given in *THE JOURNAL* editorial.

COUNCIL ON MEDICAL SERVICE

MEDICAL CARE FOR THE DEPENDENTS OF SERVICEMEN

The following report was made by the Council on Medical Service to the Los Angeles County Medical Association, Welfare Council of Metropolitan Los Angeles, and such other local agencies as are concerned with providing medical, hospital, and related services to the wives and dependents of servicemen

During 1951 the increased tempo of the "cold war," including the so-called Korean Police Action, resulted in a renewed interest on the part of Congress in legislation to create a program similar to the Emergency Maternal and Infant Care (E M I C) program of World War II. In order to be informed on the subject and be prepared to give sound advice on any legislative proposals that might be introduced in Congress, the American Medical Association Council on Medical Service assigned the matter to its Committee on Maternal and Child Care for full study and review.

As a first step the Committee conducted an opinion survey to learn the reaction of the medical profession to the E M I C program of 1943 to 1947 and what, if any, suggestions might be made for improving the program, if adopted by Congress. Included in the survey were all state medical associations and several hundred physicians representing general practice, obstetrics and gynecology, and pediatrics.

The second step taken by the Committee was a series of conferences with representatives of various national agencies, such as the American Hospital Association, the Association of State and Territorial Health Officers, the American National Red Cross, the American Academy of Pediatrics, and the associations representing obstetrics and gynecology. These meetings offered an opportunity to learn more concerning the good and bad points of the E M I C program's operation and to learn the opinion of those most concerned in such a program as to the present need of national legislation in the field. There was almost unanimous agreement that a national program was not needed at the present time (1951). On the other hand, in view of the special obligation of civilians toward those drafted into military service and the uncertainty of the future of the "cold war," it was generally agreed that more specific data were needed concerning the problems encountered by the wives of servicemen during pregnancy periods and the type of medical care received. In view of this, the Committee made numerous inquiries as to where, how, and by whom such studies might best be conducted. At the suggestion of the executive officer of the Los Angeles County Medical Association, contact was made with the research division of the Welfare Council of Metropolitan Los Angeles and arrangements were made for the preparation of a prospectus for such a study. This prospectus was reviewed with representatives of the various national agencies previously mentioned, and a three part study was authorized, to begin in January, 1952, to be financed jointly by the welfare council and the American Medical Association.

The general purpose of the study was to identify the problems encountered by servicemen's wives when seeking and receiving maternity and infant care and on the basis of the findings seek to point out such remedial measures as might be indicated and the agency or agencies that should initiate them. The research division of the Los Angeles Welfare Council accepted responsibility for the technical aspects of the fact finding and as stated in the final reports, "enjoyed complete freedom in developing the design for the study, for the interview schedule construction, and for analysis of the findings."

Part 1 of the study concerns the problems encountered and the type of care received during pregnancy. It was begun

in January, 1952, and reported on in April, 1952. The data was secured through interviews with all servicemen's wives living in Los Angeles County who delivered during a selected week in January, 1952. These women were interviewed by a trained staff in a total of 89 hospitals and maternity homes and, in a small number of cases, in their own homes shortly after delivery.

Part 2 concerns the problems encountered and the type of care received during the postnatal period by both mother and the child. It was begun in April, 1952, and reported on in December, 1952. The data for part 2 were gathered through interviews with a sample of servicemen's wives who delivered during the month of August, 1951.

The Committee on Maternal and Child Care of the American Medical Association Council on Medical Service has followed the study closely, reviewing all data reports as they were completed. The executive office of the Los Angeles County Medical Association was kept advised of progress, and the study reports and interview abstracts were available for review. While the A M A did not officially participate in the study, several of its members participated in the discussion at its inception and personally kept informed of its progress.

In view of the importance of this study, not because the specific findings are applicable nationally but rather because the follow up or remedial measures that result may well be applicable elsewhere in the nation, the Committee on Maternal and Child Care met in Los Angeles during the last week in January, 1953, to confer with representatives of groups and agencies concerned with providing medical, hospital, and related care and services for the wives of servicemen. On the basis of its own inquiries into the operation of the World War II E M I C Program, the conference with other national agencies, the study conducted here in Los Angeles, and the discussions with representatives of local groups and agencies, the Committee on Maternal and Child Care believes the following assumptions to be reasonable:

- 1 The dependents of our military men, particularly of those who are drafted into the service, constitute a group whose age, income, and frequently transient status, are such as to warrant special consideration on the part of civilian agencies concerned with medical, hospital, and related services.

- 2 In Los Angeles County there is ample evidence that the wives of servicemen do receive good medical and hospital care during pregnancy. The study showed that prenatal care was obtained by the third month in all but one case studied. Every delivery was in a hospital and attended by a physician, and postpartum and pediatric care was both available and utilized.

- 3 There is also ample evidence that Los Angeles County has adequate civilian facilities to provide the dependents of servicemen with necessary medical and hospital care during pregnancy as well as related services, such as counseling, day care for children, and assistance in working out other problems that may arise during this period of stress. In addition, there are in the area military facilities that supplement civilian facilities and may be utilized if the wives so desire.

- 4 Despite the existence of adequate facilities and services a substantial proportion of these women encountered problems. This, in itself, is only natural, since these wives represent a cross section of young American women faced with both a physical and mental ordeal. Except for complications introduced in some cases by residence in a strange city and by the absence of the husband, the problems are much the same as those encountered by other women of similar age and circumstance.

- 5 Yet, because of the recognition that this group does warrant special consideration and because of the fact that adequate facilities and services do exist in Los Angeles that, if coordinated and utilized, would have reduced the problems encountered to a minimum, it would seem that they should not be ignored.

- 6 These problems for the most part concern (a) cost planning, (b) coordination, and (c) information. Cost, of course,

is a problem with which most of the wives were concerned. Although cost was not a factor in obtaining good medical and hospital care, it did influence the type of service and facility to which a number of wives turned for care, i e, private, public, or military. Although some wives preferred military facilities and some preferred public facilities, there were others who preferred private facilities but because of either a lack of knowledge as to where services and facilities were available within their budget or because they had failed to budget for the cost involved found it necessary to go to the public or military hospital. Selection of a public or military facility instead of a private physician and hospital, however, was a matter of choice oftener than it was dictated by financial reasons. The study showed that 60% preferred and made arrangements for private services and probably another 5 to 10% would have preferred private facilities had they known how to make the necessary arrangements. Cost planning is, of course, a necessity in all private care, whether it be provided at usual fee and hospital rates or on a reduced basis. It is obvious in the Los Angeles study that where cost planning started early enough and was reasonable and consistent, the wives obtained and paid for private care. It was equally obvious that a lack of planning was frequently the cause of the financial inability of other wives to obtain private care, even when it was preferred. The Committee believes that attention must be given to developing some organized center through which these women can obtain counsel as early as possible concerning financial planning. Such counseling, coupled with knowledge of where and how services can be obtained within the means of the wives' ability to pay, should minimize the cost problem.

Lack of coordination among the numerous groups and agencies ready and willing to serve the wives of servicemen resulted in many unnecessary problems. This is particularly true because of the wide area covered by Los Angeles County and the resultant problems of transportation. For the most part transportation problems could have been alleviated by knowledge of existing facilities available to these women and within easy commuting distance. Other problems, such as those concerned with day care for children, the obtaining of proper allotments, and the need for home nursing or house-keeping services, would also be minimized with proper coordination among the agencies offering such services.

The lack of knowledge concerning facilities and services available and sources to which to turn for assistance and information was amazing, particularly in view of all of the agencies interested in serving these women. It was quite evident from the study that every effort should be made to remedy this situation, and the Committee believes the following recommendations be reasonable and practicable.

It is recommended that a special coordinating committee be established in Los Angeles County whose purpose would be (a) to assure the men serving in our military forces that their wives and families will have adequate medical and hospital facilities available in time of need (b) to concentrate primarily on facilities and services needed during periods of pregnancy, (c) to develop complete and descriptive data concerning both facilities and services available in the Los Angeles area (d) to coordinate all of these facilities and services to the end that each will recognize and accept its part in assuring care to the servicemen's dependents (e) to reach the wife of every serviceman in Los Angeles County with this information, (f) to provide proper counseling services to the wives, and (g) to encourage the utilization of civilian services and facilities to the end that military facilities will be used only for the purpose for which they were constructed, i e, the care of military men.

It is further recommended that this coordinating committee be sponsored by the Los Angeles County Medical Association and be composed of representatives from the following groups: (a) Los Angeles County Medical Association (b) local obstetrical and pediatric societies (c) local hospital association

(d) Welfare Council of Metropolitan Los Angeles, (e) Veterans Service Center, (f) American National Red Cross, (g) local health department, and (h) such other groups as may be concerned with this problem.

It is further recommended that this coordinating committee undertake the following activities: (a) Preparation of a complete listing of all services available to the wives and dependents of servicemen that might be helpful during and following pregnancy. Such a listing should describe the service, give the costs, if any, and provide the address, telephone number, and name of the agency or person, or both with whom contact should be made. Such a listing should also contain basic maps of the various areas involved, showing by symbol the locations of the services available. Finally, it should be published in such manner as to be readily identified and easily carried.

(b) Creation of a central information center to which the wives of servicemen might turn for advice and information regarding all of the available services listed in (a). The purpose of this center should be the coordination of information to the end that the wives will learn where to go for such assistance, service, advice, or guidance as may be needed or indicated.

(c) Determination of ways and means of seeing to it that every serviceman's wife in the area has a copy of the published listing and knows of the existence of the central information center.

(d) Evaluation of all listed available services for the purpose of recommending steps for improvement and for better coordination.

The Committee also makes the following recommendations:

(a) The Welfare Council of Metropolitan Los Angeles should specifically undertake, in cooperation with its member agencies, to assure that counseling services, day care services, home-maker services, and such other social services as may be deemed necessary are available directly to the wives of servicemen or through referral from the central information center.

(b) The local hospital council, in cooperation with its member hospitals, should assure that hospital facilities are available to wives of servicemen during delivery at costs that the wives can afford to pay.

(c) The Red Cross should continue with its present excellent service program for the wives of servicemen and assist, through its staff, in reaching these wives with proper information as to available facilities and resources.

(d) The Veterans Service Center should offer its extensive facilities in reaching the servicemen with information concerning the project suggested here.

It is further recommended that the Los Angeles County Medical Association specifically undertake the following activities:

(a) Financing of the Committee, preparation of the listing, and its publication.

(b) The joint staffing, with such other agency or agencies as may wish to participate, of the central information service. This agency should be located where it is most convenient, with four possibilities that seem logical: the medical society, the welfare council, the Veterans Service Center or the Red Cross.

(c) Assurance, in cooperation with the local chapter of the American Academy of General Practice and the local obstetric and pediatric societies, that physicians' services are available to the wives and children of servicemen at costs that the wives can afford to pay.

Finally, it is recommended that every effort be made to inaugurate this program immediately, as a major morale booster for those servicemen now fighting in Korea and for those awaiting shipment orders so that they need not be concerned over the care of their wives and dependents.

Antibiotic Resistance of Pathogenic Staphylococci.—Five hundred strains of hemolytic, coagulase-positive *Staphylococcus aureus* isolated at the Boston City Hospital from October, 1951, to February, 1952, were tested for sensitivity to nine antibiotics. The incidence of penicillin-resistant strains and the increase over previous observations in the proportion of strains resistant to aureomycin and oxytetracycline (Terramycin) were the most significant observations. About three fourths of the strains were resistant to penicillin, one fourth were resistant to aureomycin, and one-third were resistant to oxytetracycline. The close correlation between penicillin resistance and penicillinase production was confirmed. Except for a slight overlap of seven strains that were inhibited by 3.1 or 6.3 μ g of penicillin per milliliter, all strains resistant to higher concentrations were penicillinase producers, while those sensitive to lower concentrations were not. There was no close correlation between the source of the strains and their antibiotic resistance. The fecal strains, however, included a higher proportion of strains resistant to penicillin, aureomycin, and oxytetracycline than did those from any other source. There was a close correlation between resistance to aureomycin and to oxytetracycline when allowance is made for the relatively lower inhibitory action of the latter on a large proportion of the strains. There was no correlation between the grades of susceptibility to streptomycin and to any of the other antibiotics. On the other hand, strains that were resistant to aureomycin or to oxytetracycline were all resistant to penicillin, the reverse, however, was not true. While there was some relation between the incidence of antibiotic resistant strains and use of the corresponding antibiotics in treatment of the patients from whom the strains were isolated, the correlation was not a close one. However, the data do suggest that while previous antibiotic therapy of any given patient may be an important factor in the occurrence of strains resistant to that antibiotic, the widespread use of antibiotics may be of equal or greater importance in the increase in incidence of staphylococci that are resistant to those antibiotics, such strains may become or remain pathogenic and retain their resistance when they are disseminated and acquired by patients who have themselves not received such antibiotics.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individual subscribers provided they reside in continental United States or Canada. Requests for periodicals should be addressed Library American Medical Association. Periodical files cover only the last 11 years and no photoduplication services are available. No charge is made to members but the fee for other borrowers is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted

Clinical and Laboratory Study of Hemorrhagic Fever.—During the autumn and winter of 1951-1952 an outbreak of epidemic hemorrhagic fever occurred in Korea, chiefly in and around the cities of Kumhwa, Chorwon, and Yonchon. The 31 patients in this series were United Nations personnel from that area. No etiological clue was obtained from their histories of food and water ingestion, individual activities, disease contacts, or past illnesses. The clinical syndrome was a composite of nonspecific febrile, cardiovascular, gastrointestinal, renal, and hemorrhagic manifestations, with occasional neurological complications. The onset was usually abrupt, with shaking chills, fever, headache, backache, dizziness, eye pain, and blurred vision. The addition of malaise, fatigue, anorexia, nausea, vomiting, and myalgia produced a picture of severe prostration. A deep erythematous flush of the face and neck, injection of the membranes of the soft palate and palpebral conjunctiva, and edema of the face and eyelids were present almost from the onset. Examination revealed tenderness of the abdomen and of the costovertebral angle, moderate lymphadenopathy, and occasional enlargement of the liver or spleen. During the acute fever peripheral vascular collapse with hypotension and weak peripheral pulses were often seen. Usually, all the symptoms and signs become most intense between the third and seventh days of illness. As early as the second day, a hemorrhagic tendency was evidenced by petechiae in the axillae and soft palate. These and other signs of hemorrhage reached their height at the end of the first week of illness. An increase in capillary fragility, a depression of the platelets, and a prolongation of the bleeding time were found during the period of hemorrhage. Renal involvement appeared between the second and fourth days of illness, with microscopic hematuria and albuminuria. By the end of the first week, the urine output began to decline. Oliguria was accompanied by a fall in specific gravity of the urine and blood nitrogen retention appeared. The renal damage varied from transient abnormalities of the urine to severe uremia. Toward the end of the second week of illness, many of the symptoms began to subside. By the third or fourth week of illness, most of the symptoms and signs had disappeared or were markedly diminished, and during the next few weeks, weight, strength, and renal function returned to normal. There usually was no residual damage.

Bilateral Ductus Arteriosus.—At one stage in its embryological development the aortic arch system includes a sixth (pulmonary) aortic arch on each side. The right and left pulmonary arteries arise as branches of these arches. The right sixth arch disappears beyond the point of origin of the right pulmonary artery. On the left side the corresponding portion of the sixth arch persists as the ductus arteriosus. Certain malformations are characterized by abnormal retention or disappearance of the elements of the sixth (pulmonary) aortic arches. For example, disappearance of the left sixth arch be-

yond the origin of the left pulmonary artery and persistence of the entire right sixth arch result in the presence of a ductus arteriosus on the right and none on the left. Loss from each sixth aortic arch of the portion beyond the origin of the respective pulmonary artery yields an aortic arch system in which there is no ductus arteriosus. Rarest of all malformations involving abnormal retention or disappearance of one or the other of the two sixth aortic arches are those in which these arches persist in their entirety. Kelsey and associates describe such a case. Bilateral ductus arteriosus was found, accompanied by isolated dextrocardia, ventricular septal defect, and pulmonary atresia in a boy, who died at the age of 10 months. The left ductus arteriosus was obliterated in a normal manner, while the right ductus arteriosus was patent and served as a collateral channel for pulmonary blood flow.

Primary Alveolar Cell Carcinoma of Lung—Fischer and Holley present five cases of so-called primary alveolar cell tumor of the lung and a probable sixth case is mentioned briefly. All the tumors were malignant, producing regional or distant metastases. In all cases both lungs were involved. In three the tumor was multiple nodular in type, while in the other three it was combined nodular and diffuse. The histological structures of the two forms are identical. In biological behavior the tumors resembled a carcinoma. The opinion is expressed that these tumors arise from terminal bronchiolar epithelium. The gross and microscopic features corresponded closely to those described by Swan and by Neubuerger and Geever. The ratio of males to females was 4:2. The patients' ages ranged from 47 to 80. The clinical signs and symptoms were those of a chronic pulmonary disease. It is believed that the widespread tumor growth in the lungs interfered with normal pulmonary function and thus was an important contributory cause of death. Alveolar cell tumors of the human lung are rare. In 1942 Neubuerger and Geever collected 25 authentic cases and added 2 of their own. In 1949 Swan, in screening approximately 900 pulmonary neoplasms, found nine pulmonary tumors which fulfilled the criteria established for tumors of this type: tall columnar mucus-secreting cells lining the pulmonary alveoli, absence of an intrinsic tumor of the bronchi, and absence of a primary adenocarcinoma of any other part of the body. Since 1949 many additional papers have been published on this rare pulmonary tumor.

Amebiasis.—Stools obtained by purgation, enema, or sigmoidoscopic aspiration from 357 mildly symptomatic or asymptomatic patients between the ages of 5 and 79 years were examined for amebas. 85 (23.8%) contained *E. histolytica*. This parasite was found oftenest in the sigmoidoscopic specimen. No trophozoite passers were found in this group. Malaise, weakness and nervousness were seen in 47 of the 85 patients with amebas, abdominal discomfort in 30, constipation in 21, flatulence and food idiosyncrasies in 16 and diarrhea in 14. All 85 patients were initially given antiamebic treatment by one of two methods: (1) bismuth glycolylarsanilate (Milibis) in doses of 500 mg. three times daily for 16 days followed by chloroquine phosphate (Aralen diphosphate) in doses of 125 mg. twice daily for 30 days, followed by a second course of bismuth glycolylarsanilate and then a second course of chloroquine phosphate, or (2) oxytetracycline (Terramycin) in doses of 500 mg. every six hours for 10 days. Of 63 patients passing cysts of *E. histolytica* with bismuth glycolylarsanilate and chloroquine phosphate, 22 were given combined retreat-

ment consisting of the simultaneous administration of 500 mg. of oxytetracycline four times daily, 250 mg. of chloroquine phosphate twice daily, and 500 mg. of bismuth glycolylarsanilate three times daily for 10 days. Bismuth glycolylarsanilate and chloroquine phosphate seemed to be superior to oxytetracycline alone. Simultaneous administration of all three of these drugs for 10 days was the most effective combination tried. Fifty-three (70%) of the mildly symptomatic or asymptomatic patients passing cysts became free of their presenting complaints 5 to 20 days after the institution of antiamebic treatment or were definitely improved, and, therefore, could be considered as receiving benefit from antiamebic therapy. Startling and dramatic recoveries were observed in many patients who had been hitherto considered neurotic. Many months of observation are necessary for the proper evaluation of any form of treatment for *E. histolytica*.

The Surgical Problem of Peptic Ulcer in Childhood—Three children with gastric ulcer and 13 with duodenal ulcer have been seen at the Children's Hospital of Pittsburgh over a 14 year period The three with gastric ulcer had the follow-

ing associated diseases tuberculosis of the spine, brain abscess and bronchial asthma Splenomegaly due to Banti's syndrome, congenital hydrocephalus, serious drug reaction, and cystic fibrosis of the pancreas were associated diseases in the children with duodenal ulcer The ages of the children ranged from 6 weeks to 14 years Gastric analyses seemed of little value in the diagnosis of peptic ulcer in childhood Diagnosis was made at postmortem examination in four cases, at operation in two cases, and by roentgenogram in ten cases In five of the children an attempt was made to cure the ulcers by gastroenterostomy Two remained well, having been followed up for nine and 18 months, respectively, in two marginal ulcers developed, and the fifth required a subtotal gastrectomy because of obstruction and hemorrhage four years after the original operation Four patients, who did not receive surgical treatment, died When a peptic ulcer perforates in a child, surgical closure is necessary While hemorrhage can frequently be managed conservatively, a large percentage of such children require additional treatment Gastroenterostomy may not be the best procedure to relieve intractable symptoms and obstruction in children

Duplications of Alimentary Tract in Adults—The fact that three alimentary tract duplications were observed within six months in patients from 31 to 51 years of age convinced Nolan and Lee that those congenital anatomic errors are more frequent in adults than is generally realized The true incidence of these duplications is difficult to determine, the more so since the term has only recently been accepted as including not only tubular supernumerary viscera, such as ileum duplex, but also spherical forms, which generally have been described as enterogenous cysts, enterocystomas, and inclusion cysts of the alimentary tract Many tubular duplications have been mistaken for unusual Meckel's diverticula, and spherical duplications, when found in the thorax, have been called congenital gastric cysts Of the three patients whose histories are presented, one had a massive gastric duplication associated with hemorrhage, the second had a spherical duplication of the esophagus, associated with inferior vena caval compression, and the third had a spherical duplication of the ileum, associated with intussusception The embryology, pathology, clinical and roentgenologic aspects, and the treatment of duplications of the alimentary tract in adults are discussed In the treatment of duplications two points are important. First, since the duplication and the parent intestine have the muscularis in common, no plane of cleavage can be established Second, the blood supply to the normal alimentary tract may be destroyed by removal of the duplication For these reasons, resection of both the normal and abnormal alimentary tract is the method of choice in most instances If the organ concerned has a large lumen and an almost indestructible blood supply, as does the stomach, resection followed by closure of the resultant defect is a feasible procedure In small spherical duplications, simple excision by sharp dissection through the plane of the muscularis, followed by serosal apposition, is a permissible procedure The danger of resecting a large duplication with a broad attachment to the esophagus cannot be overemphasized Resection in several instances in children has been followed by disaster When the duplication is associated with a portion of the alimentary tract, which lends itself well to surgical resection, the outcome is more likely to be favorable

Treatment of Cancer by Intra Arterial Injection of Nitrogen Mustard—Brief case reports are presented of 11 patients with advanced cancer treated by intermittent intra arterial injection of the nitrogen mustard, bis (beta-chlorethyl) amine hydrochloride The drug had little beneficial effect in eight of these patients Three patients showed temporary improvement in the form of regression of the mass or relief of pain Complications accompany this type of therapy Necrosis of the soft tissue of the neck was produced by extravasation of the drug into the wound Bone marrow depression resulted when large amounts of nitrogen mustard were used Transient and occasionally serious edema developed in parts when catheters were placed in head and neck The tongue became severely edematous and the skin became red and scaly or necrotic Cerebral

effects occurred occasionally with large doses or with treatment through the carotid artery. Nausea, malaise and weakness were constant. Insertion and care of catheters and the administration of the drug require technical skill, a great deal of personal attention, careful observation, and nursing care. The authors feel that the benefit obtainable by this method is not sufficient to counterbalance the adverse effects, reactions, and unavoidable complications.

Hexamethonium and Congestive Heart Failure.—Hypotensive doses of hexamethonium (30 mg on the average) were administered intravenously to 16 men and 3 women between the ages of 37 and 79 with different types of heart disease in various degrees of congestive failure. The immediate effects of this treatment were a fall in venous pressure in all patients exhibiting initial elevations, shortening of the circulation time and a decrease in heart rate in most cases, and frequent symptomatic improvement in the degree of dyspnea and orthopnea. Right auricular, right ventricular, and pulmonary arterial pressures also were reduced following hexamethonium administration. Cardiac catheterization studies carried out in 4 of the 19 patients revealed a decrease in intracardiac or pulmonary arterial pressures that paralleled the fall in arterial pressures following hexamethonium. An increase in cardiac output with a pronounced decrease in total peripheral resistance was observed in one cardiac patient in whom such determinations were carried out. It is suggested that hexamethonium, by reducing the total peripheral resistance and

diverting blood volume to the peripheral vasculature, may interrupt the vicious cycle associated with congestive heart failure by, first, decreasing the work demand of the left ventricle and, second, reducing venous overloading of the right heart.

Cortisone in Acute Rheumatic Myocarditis.—A 10-year-old girl with acute rheumatic fever was treated with prolonged courses of corticotropin (ACTH) and cortisone early in her illness but her disease was constantly active and progressive. She received no hormone therapy for a six week period terminating 16 days before death. During her final hospitalization she was given large doses (100 mg every eight hours) of cortisone intramuscularly with a total dose of 3,200 mg. There was no demonstrable clinical response to this therapy, and the patient died of intractable congestive heart failure. Necropsy revealed numerous interstitial lesions in the myocardium, many of which were acute and of highly atypical appearance. The changes consisted of various sized but frequently extensive and stellate areas of intense fibrinoid degeneration of collagen accompanied by little or no cellular reaction. Myocardial lesions that appeared to be of longer duration showed varying degrees of healing and did not differ from those seen in rheumatic myocarditis not treated with corticotropin or cortisone. The lesions observed by the authors in this case may be interpreted as representing a suppression of cellular reaction to altered collagen. The findings did not indicate that the injury to connective tissue associated with rheumatic fever has been prevented to any degree. The authors are unable to evaluate the effect of the observed morphological alterations on the eventual fate of the lesions. The significance of their observations will have to be determined by the long term studies now in progress of patients with rheumatic heart disease who have been treated successfully with corticotropin and cortisone.

Diethylaminoethyl Ester Hydriodide of Penicillin G in Bronchopulmonary Infections.—During the past year 80 patients with chronic bronchopulmonary disease, including chronic bronchitis, bronchiectasis and chronic pneumonitis, received a total of 100 courses of the hydriodide salt of diethylaminoethyl ester of penicillin G (Neo-Penill). Excellent results were obtained in 55, moderate improvement in 27, and little or no benefit in 18 of the 100 courses. The diethylaminoethyl ester of penicillin was supplied as the hydriodide salt in the form of a dry, relatively insoluble powder which, when reconstituted with sterile distilled water, formed a milky suspension having a potency equivalent to 300,000 Oxford units of penicillin.

per cubic centimeter The original material, 1714-J Formula A, produced considerable foaming when reconstituted This difficulty has been overcome in the more recent material (Formula D) The penicillin was administered intramuscularly once or twice daily in doses ranging from 500,000 to 2,000,000 units, with an average total dose of 9,000,000 units The duration of therapy varied from three to 18 days, averaging about eight days Ninety therapeutic courses were given to patients with purulent or mucopurulent sputum After treatment there was no sputum in four instances, mucoid sputum in 55, mucopurulent sputum in 19, and purulent sputum in 12 Sputum cultures after treatment were sterile in 36 and yielded gram negative bacteria in 27, *Staphylococcus aureus* in 14, *Bacillus proteus* in four, *Pseudomonas pyocyanea* in one, yeast organisms in three, and other organisms, including *Streptococcus viridans*, in five The authors feel that diethylaminoethyl iodide penicillin is quite effective in infections due to gram positive organisms Allergic reactions to penicillin and sensitivity to iodine were observed at times, but these side-effects were not sufficiently severe or frequent to limit the use of the drug

Pneumonia Comparison of Hydriodide of Diethylaminoethyl Ester of Penicillin G (Neo Penil) and Procaine Penicillin—The hydriodide of diethylaminoethyl ester of penicillin G (Neo Penil) gives rise to lower and less prolonged plasma concentrations than does procaine penicillin, but animal and human experiments have shown that the new penicillin G ester has a far greater affinity for the lungs than other penicillin preparations Since these unusually high tissue concentrations occur in the absence of high blood levels, it is felt that the tissue levels are due to the pharmacological property of the drug and not merely to a high blood tissue diffusion gradient Furthermore, the new penicillin G ester is a repository penicillin salt, but to a lesser degree than is procaine penicillin During the winter of 1951-1952, 114 pneumonia patients admitted to the adult fever wards of the Philadelphia General Hospital were divided into two therapeutic groups 55 received Neo-Penil, and 59 received procaine penicillin In general, the two groups were comparable as to the factors influencing prognosis The dose schedule with Neo-Penil and procaine penicillin was 500,000 units intramuscularly daily for a total of five days This was sufficient in 47 of the patients receiving Neo Penil and 48 of those in the procaine penicillin treated group There were five patients in each group who required therapy for 10 days because of certain complicating factors Also, there were nine patients (three in the Neo Penil treated group and six in the procaine penicillin treated group) who were given crystalline penicillin G in addition Three of the 114 patients died, but in each of these, the pneumonia was complicated by some serious, pre-existing disease process There were no untoward reactions attributable to either form of penicillin therapy in this series of cases Repeated roentgenographic studies were made on 94 of the 114 patients (42 in the Neo Penil treated group, 52 in the procaine penicillin treated group) within two weeks approximately 75% of both groups showed significant or complete resolution These data offer no evidence of significant difference between the two forms of penicillin in their ability to reduce fever Furthermore, both forms were equally adequate as far as the end results of therapy were concerned

Painful Shoulder—The condition discussed has been called bursitis, tendinitis, peritendinitis, pariarthritis, fibrositis, ruptured tendon, or bicipital syndrome The author limits the discussion to shoulder pain arising from local lesions of the rotator cuff, tendons, bursae, and tendon sheaths Symptoms may vary greatly In recent, complete rupture of the supra spinatus tendon, there is a history of an injury or strain, followed in 6 to 12 hours by severe pain and muscle spasm rendering the arm immobile Then there is the person who feels an occasional "catch" while the shoulder is in certain positions but who has no limitation of motion or other symptoms Pain is usually located over the greater tuberosity and radiates down the arm or across the upper trapezius fibers to the posterior aspect of the neck Swelling may be present over the bursa In the more usual case pain begins as an unpleasant sensation elicited by certain motions of the arm It becomes progressively more severe until it may wake the patient at night when he turns to the affected side The arm feels "dead" or weak X ray examination helps to exclude shoulder pain caused by bone or periosteal trauma, tumor, or infection, but it does not rule out tendinous or peritendinous lesions, which may be assumed to be present when symptoms and physical findings are typical Pain from visceral pathological conditions such as from the gallbladder, heart, or diaphragm must be excluded, as well as pain from cervical spine or spinal cord lesions A roentgenogram may not show calcific deposits near the tendinous insertions, but it may disclose increased density or irregularity in the bone at the tendinous insertion This is indirect evidence of an irritative process at this point Decalcification in the bone indicates a long-standing pathological condition with advanced tendon degeneration The author reviews observations on 125 patients with shoulder pain who were subjected to roentgen therapy Calcific deposits were present in the soft tissues in 78 patients Decalcification of the greater tuberosity was present in 14 and sclerosis on the bone margin in 26 of the patients Roentgen therapy was considered successful in 74% of the patients treated The highest percentage of good results was obtained in the younger age groups and in those patients in whom the symptoms had been of shorter duration

Surgical Restoration of Coronary Circulation—The principle of arterialization of the myocardial capillary bed by reversal of the blood flow through the coronary sinus was successfully carried out by Beck and his co-workers Bailey and associates present anatomic investigations that demonstrate that this procedure is helpful in cases of advanced coronary arteriosclerosis. Most of the 18 patients presented here were operated on by Beck and the others by Bailey. A segment of a large superficial vein, either the median basilic vein of the arm or the external jugular vein, is removed under local anesthesia. The segment is irrigated with heparin solution and placed between layers of moist gauze. The patient is then anesthetized for the anastomosis. After the pericardium has been opened, the coronary sinus is identified and is traced to its terminus into the right atrium. After it has been partially dissected free from fat a curved needle, threaded with a heavy (Orlon) suture, is passed completely around the sinus about 1 cm from its terminus, leaving a loose loop of double suture, which is to be tied down at the second operation to obstruct largely the exitus of blood from the coronary sinus into the right atrium. This step will ultimately insure the reversal of flow through the coronary

sinus. The needle is removed, and the ends of the sutures are tied together, rolled into a small coil and sutured out of the way within the pericardium for easy accessibility at the second operation. A segment of the sinus, which is exteriorized by a clamp, is incised, and the vein graft is anastomosed to this incision. The other end of the graft is anastomosed to the aorta. At the second stage of the operation, which is performed three weeks after the first, the previous pericardial incision is reopened, and adherent tissues are dissected away from the region of the graft. Then the rolled up double Orlon suture is located, the two strands are separated and each is tied down separately over a 3 mm probe, thus providing a 3 mm passageway through which the sinus blood can partly escape into the right atrium. Two of the 18 patients, in whom reversal of the blood flow through the coronary sinus was planned, did not actually have an anastomosis performed, in one of these two, the coronary sinus was so delicate that it would not hold a suture and was closed with difficulty, in the other patient, the coronary sinus was too far to the right of the aorta, making anastomosis technically impossible. There were two deaths, one due to exsanguinating hemorrhage at the aortic anastomosis on the seventh postoperative day, the other occurred a few hours after surgery. Empyema developed in one patient after the first operative stage. In two patients, in whom thrombosis of the anastomosis was disclosed at the time of the second operation, the Orlon sutures were tied down, and both patients showed slight improvement. Of the remaining 11 patients, four had thrombosed grafts at the second operation. They were treated by instillation of asbestos powder into the pericardium. One of these four is slightly improved, two are unchanged, and one died six months after surgery. The seven with patent grafts showed improvement, varying from "clinical cure" to moderate amelioration. Among the modifications that reduce technical failures is the removal of a button of aortic wall rather than mere incision of the aorta to produce rapid flow of blood through the grafts and sinus. It is believed that this will reduce the incidence of thrombosis of the graft.

Ligation of Inferior Vena Cava in Cardiac Decompensation

—Ligation of the inferior vena cava combined with section of the right lumbar sympathetic nerve benefited 8 of 10 patients with cardiac decompensation. Pulmonary and hepatic stasis and peripheral edema and ascites disappeared or were reduced. Marked improvement in response to medical therapy, so that digitalis and diuretics recovered the efficacy they had lost before the operation, was constant and was apparently related to improved renal function, demonstrated by Van Slyke's urea clearance test. Rapid development of collateral venous circulation following ligation of the inferior vena cava probably reduces ascites by drawing the blood to the azygos system and facilitating resorption of the intra-abdominal transudate. Ligation of the inferior vena cava is indicated primarily for relief of the right side of the heart in decompensated patients who can no longer be helped by medical treatment. Edema is not an absolute contraindication except when it is caused by an initial right ventricular insufficiency of the cor pulmonale type, in which case Starling's law is rendered ineffective by the dilation of the right chambers. The indications for the procedure may well be extended to include chronic cardiac insufficiency, which, even though fairly well tolerated, can be expected to benefit from ligation of the inferior vena cava when renal function begins to decline as the heart condition deteriorates. Section of the right lumbar sympathetic nerve, which presents no difficulty because the nerve is always accessible during the operation, increases the effectiveness of the procedure by retarding the return of the circulation to the heart. The psychological preparation of the patient is very important, phenobarbital (Luminal) or morphine, either alone or in combination, should be given for several days before the operation to produce a genuine state of euphoria. Two patients with long standing heart disease who were in a state of anxiety amounting almost to panic before the intervention died as a result of shock, the other eight are alive and much improved. Complications (increase in blood urea with agitation and disorientation, transient auricular fibrillation, or benign phlebitis) were not severe and were rapidly corrected with appropriate treatment.

Treatment of Traumatic Effusions of Knee—Effusion into the knee joint, which frequently follows arthrotomy, may subside in a few days, but in a high proportion of cases it recurs when active flexion of the knee is started. If the effusion persists longer than a few weeks, the articular ligaments become permanently stretched, gross wasting of the quadriceps muscle occurs, and full movements of the joint may never be regained. An investigation was carried out in 260 patients with traumatic effusions of the knee to discover the treatment of choice in accelerating the disappearance of an effusion. In 95% of cases the effusion followed meniscectomy, and in 5%

was a simple nonoperative traumatic effusion. All patients were given remedial quadriceps exercises at an Air Force Medical Rehabilitation Unit, in addition, five different treatments were investigated. The average time required for the disappearance of the effusion was 23.3 days, with exercises alone, 23 days with a crepe bandage, 24.8 days with constant current galvanism, 10.3 days with immobilization in a back splint alone, 14.2 days with back splint and anodal galvanism, and 9.4 days with rest in bed and immobilization in a back splint. It is concluded that the use of crepe bandages alone or of galvanism (either through and through" technique or anodal galvanism) has no place in the treatment of knee effusions. The method of choice was found to be complete and continuous immobilization of the knee in a back splint and bandage with intensive static quadriceps exercises. The results further suggest that rest in bed is not necessary to accelerate the disappearance of a knee effusion.

Corticotropin and Cortisone in the Schoenlein-Henoch Syndrome—Since a relationship seems to exist between the Schoenlein-Henoch syndrome and diseases such as acute nephritis, rheumatic fever and polyarteritis nodosa, Philpott and Briggs decided to try corticotropin and cortisone in the treatment of Schoenlein-Henoch syndrome. They describe observations on nine children with the Schoenlein-Henoch syndrome, six of whom were given only corticotropin, two first corticotropin and then cortisone, and one only cortisone. The potency of the hormones was judged by the response of the circulating eosinophils and seems to have been adequate in most cases. The general condition improved rapidly in some and slowly in other cases, but similar improvement has been known to occur spontaneously. The hormone treatment did not prevent relapses. Skin manifestations recurred in eight cases. Nephritis developed in three patients in whom it had been absent before treatment, neither did the hormones have any effect on the course of existing nephritis. The authors conclude that corticotropin and cortisone were of no value in treating the Schoenlein-Henoch syndrome. Their use should probably be considered only in cases with a severe constitutional disturbance.

The Burned Foot—This paper describes observations on 301 burned feet and their management. There were 247 patients (180 males and 67 females). About half of the patients, that is, 119 men (131 burned feet) and 3 women (4 burned feet) sustained their burns while at work. Eighty-eight of the 125 persons who sustained domestic burns were scalded with hot water or tea and 5 with gravy or hot fat. Grafting was employed on 187 of the burned feet in 61 on the day of burning, in 27 from 1 to 7 days after, and in 99 more than a week after the burn was sustained. Repeated grafting operations were required in 39 of the 187 feet. The authors stress that the best treatment for totally destroyed skin is excision and grafting within a few hours of burning. All the surviving 68 patients who did not require grafting made full recoveries. Of 174 patients who had grafts on one or both feet, 155 recovered fully and 15 made satisfactory recoveries. Only four obtained poor results. Two were boys with badly burned feet, one was an arthritic elderly man, and the fourth was a heavy woman with varicose veins and gravitational edema. The value of primary excision and grafting of totally destroyed skin was confirmed, and the suitability of thin split skin grafts for the replacement of burned skin on all parts of the foot, including its weight bearing surfaces, was established.

Gold Therapy in Rheumatoid Arthritis.—After having tried the various treatments that were recommended for rheumatoid arthritis since 1936, including bee venom, vaccine, hormone therapy, massive doses of vitamins, gold therapy and corti-

sone, the authors of this paper are now returning to gold therapy as the most effective treatment. Of 29 patients in whom they used gold sodium thiomalate (Myochrysine), 17 had remissions, 9 showed improvement and in 3 the treatment failed. Toxic reactions, in the form of eruptions of the skin and mucous membranes, occurred in two of the cases. They feel that the diagnosis of rheumatoid arthritis is established if a patient presents a progressive polyarthritis with muscle wasting and periarticular thickening. Subcutaneous nodules and marked small joint crippling complete the picture. With these findings, a fast sedimentation rate corroborates the diagnosis. Treatment is withheld in nephritis, in liver damage, and in pregnancy. The "burnt-out arthritic" should not be treated, i.e., the anemic polyarthritic patient who has lived with his arthritis for decades and whose sedimentation rate is normal. This is the type of case in which gold is highly toxic and ineffective. The gold preparation is injected weekly in 50 mg doses, (first two doses 25 mg) until a total of 1,000 mg has been administered. After that, the injections are given monthly in 50 mg doses.

Periarthritis of Shoulder and Coronary Disease.—The etiology of painful, stiff or frozen shoulder is often obscure, but numerous authors have noted the frequent association of shoulder disability with severe coronary disease. After citing some literature reports on this problem, Robinson and associates say that in 35 routine autopsies in which the subacromial bursa and biceps tendon sheath were examined, 6 cases of severe coronary disease were included. Four of these patients with coronary disease showed lesions in the subacromial bursa and two of these in the biceps sheath as well. The only other individual showing significant lesions in the shoulder region had chronic rheumatoid arthritis with bursal involvement.

 *Treatment of 100 Patients with Acute Hematogenous Osteomyelitis with Penicillin H Waskönig—p 327

Penicillin in Acute Hematogenous Osteomyelitis.—Since 1947, when penicillin became available in sufficient amounts in Germany, 100 patients with acute hematogenous osteomyelitis have been treated with this antibiotic. Of these 100 patients, 84 had an abscess on admission and puncture was made immediately. In the early days of penicillin therapy puncture was followed by a local injection of 25,000 units of penicillin, but the last 42 patients were given local injection of 100,000 to 200,000 units, simultaneous parenteral administration of the antibiotic was carried out in doses of 400,000 to 800,000 units daily, with an average total dose of 13,500,000 units, but in individual cases doses of even 30,000,000 to 36,000,000 units were given. The involved part of the body was immobilized with a fenestrated plaster of Paris cast. Roentgenologic examination of the 100 patients within the first days of their disease revealed bone changes in 21. After treatment with penicillin the dose of which (700,000 to 1,600,000 units) apparently was not sufficient in six patients, sequestrums were demonstrated roentgenographically in 10 and cavity formation and destruction of bone respectively in 8. Of the 79 patients who did not show any bone changes on the first roentgenologic examination, 6 showed formation of sequestrums on the final roentgenologic examination, in two of the six the sequestrum again became part of the bone, while destruction of the bone resulted in the remaining four. Before penicillin was available for treatment, the mortality rate for acute hematogenous osteomyelitis varied from 10 to 28%. Not a single death occurred among the 100 patients treated with penicillin. Purulent involvement of joints made the prognosis of acute hematogenous osteomyelitis unfavorable before penicillin therapy was practiced. Of the authors' 100 patients, 22 had involvement of joints but stiffening of the joint resulted in only 1 patient.

Recurrences were observed in seven patients, all of whom had not yet received the large doses of penicillin that were employed later on. A complete cure was obtained by sequestrectomy combined with penicillin therapy in five and by penicillin therapy alone in two. The results of treatment thus have been improved considerably when compared with those of the prepenicillin era. Early institution of local and parenteral treatment in addition to sufficiently high doses and immobilization seems to warrant success. Despite the highly satisfactory results of conservative management, patients with acute hematogenous osteomyelitis always should be treated at the surgical department because of the great risk associated with this disease, but primary surgical treatment seems to be indicated only in cases of penicillin resistant pathogenic agents and in patients with a highly toxic form of the disease.

Studies on the Myasthenic Syndrome—Stuppler reviews clinical and experimental observations that he made in the course of two years on 22 patients with myasthenia. The etiological interpretation of myasthenia has taken two directions (1) the acetylcholine theory of Torda and Wolff and (2) the theory suggested by Wilson and Stoner, which assumes the presence in the blood of some substance that blocks the neuromuscular transmission. Stuppler cites factors that speak against the acetylcholine theory and for the appearance of so-called blockade substances, and he feels that his own investigations suggest the following interpretation as a result of the appearance of specific blocking substances after muscular exertion, the neuromuscular transmission becomes more difficult in myasthenia gravis pseudoparalytica, the potential of the end-plate decreases, and it no longer reaches the threshold value required to release the action potential in case of complete blockage. There are various degrees there may be only slight disturbances, which cause only a moderate decrease in the peak potential. In case of higher concentrations of the blocking substance, the diphasic muscular potential may almost completely disappear, as a manifestation of only a localized stimulus, the end plate current, and finally there may be complete muscle paralysis resembling that produced by curare. Attempts at inactivation suggest that the blocking substance is of enzyme character and that ionic shifts can be excluded as a determining factor. In addition to this purely neuromuscular mechanism, Stuppler assumes an additional muscular effect on the marginal phase 2, the myogenic base-plate. In

denervated dogs he was able to still obtain weakened myasthenic effect, and in this way he was able to exclude for experimental purposes the end plate effect, which doubtlessly predominates in the pathophysiological process. The fact that prostigmine has a demonstrable effect on the denervated muscle (a fact which was demonstrated by Ricker and Westcoe, as well as by Stuppler's own unpublished experiments) appears to corroborate this assumption. The therapeutic effect of prostigmine on myasthenia gravis therefore seems to be twofold as a ferment it exerts an inhibiting influence on the cholinesterase metabolism, but it also stimulates the metabolism of the contractile element itself.

Treatment of Temporal Arteritis with Cortisone and Corticotropin—Temporal arteritis is part of a generalized vascular disease of unknown etiology occurring only during the degenerative period of life. Severe headache is a constant feature of the disease, often persisting for weeks and preventing sleep. It is commonly confined to the areas of the temporal and occipital arteries, and the scalp may be so tender that mastication and the pressure of the head on a pillow are painful. Ocular involvement is common, having been reported in from 33 to 55% of cases, and may cause partial or total blindness. Treatment was formerly limited to section of the affected artery, but cortisone and corticotropin have lately been used with favorable results by several workers. Twelve patients, aged 66 to 83 years, with unequivocal temporal arteritis, in 10 of whom the vision was affected, have been treated by the authors with cortisone (orally or intramuscularly) or corticotropin (intramuscularly or intravenously) during the last 18 months. Pyrexia, head pains, and arterial tenderness subsided rapidly, appetite improved, and in some cases apathy and misery were replaced by alertness and cheerfulness. Maintenance therapy is needed until the disease reaches its natural end, premature cessation of treatment is followed by the return of symptoms. Total blindness and long standing partial loss of vision were not altered by cortisone or corticotropin, but partial loss of vision that had occurred not more than 10 days before in five patients was somewhat improved. The chief value of the treatment in such cases is probably to safeguard any remaining vision.

Controlled Hypotension in Neurosurgery—Induced hypotension was used to reduce bleeding and intracranial tension in 150 neurosurgical operations. The hypotension was induced by hexamethonium bromide plus, in 50 cases, controlled pneumatic suction applied to the legs and, in 100, posture change. Comparison of the results obtained in these cases with those obtained in 150 others without induced reduction in blood pressure shows that controlled hypotension, especially when administration of hexamethonium bromide is accompanied by negative pressure applied to the legs, leads to decreased mortality, decreased need for transfusions, and a slightly shorter duration of anesthesia. The suction technique makes it possible to produce adequate hypotension with an average tilt to the table of only 5 degrees, and once the blood pressure has been reduced to the desired level, further doses of hexamethonium bromide are usually unnecessary. The result may be considered satisfactory when bleeding is minimal or slight. A fall in intracranial tension almost always accompanies the fall in arterial pressure. The suction technique can be used to keep the blood

pressure at any desired level over a wide range or to vary it for specific purposes. Reduced suction, for instance, will permit the blood pressure to rise temporarily so that the surgeon can determine the adequacy of the hemostasis. Injurious extremes of hypotension can be avoided by making frequent determinations of the blood pressure. The effect of hypotension on patients with coronary damage is not yet clear, consequently, electrocardiograms should be made during the operation in doubtful cases. The danger of cerebral anoxia is largely avoided by the fact that the patient's position can be kept nearly horizontal. There were 10 deaths among the patients in whom hypotension was induced, as compared with 24 in the control group. The smaller death rate in the first group was ascribed to improved surgical treatment made possible by the decreased bleeding and lowered intracranial pressure resulting from the hypotension.

 *Convalescent Rubella Gamma Globulin as Possible Prophylactic Against Rubella S G Anderson and H McLorinan—p 182

Convalescent Rubella Gamma Globulin for Prophylaxis—Convalescent rubella gamma globulin has been available for several years to medical practitioners in Victoria. This paper reviews observations in three clinical trials. The globulin was given intramuscularly in doses of 2 to 4 cc as soon as possible after exposure to the virus, but not later than 72 hours after such exposure. The first study had been reported in part in 1950, but the absence of a control series was a weakness. Furthermore, before any final assessment of the protective value of the serum was possible, it seemed necessary to consider the following factors: 1. Was the primary case really rubella? 2. Was the exposed pregnant woman immune from a previous unrecognized or forgotten attack? 3. Was the duration and intensity of the contact sufficient to have produced rubella if gamma globulin had not been administered? Taking together the cases reviewed by McLorinan in 1950 and those observed since that time, 424 women exposed to rubella received 2 cc of convalescent rubella gamma globulin by intramuscular injection. Five developed rubella. Similarly of 388 who received 4 cc of gamma globulin, four developed rubella. Thus 9 women had rubella of 812 who were said to have been exposed to the disease and who were given gamma globulin. In the second study globulin was administered to 15 of 24 volunteers who had been artificially infected with rubella virus. Under these conditions the globulin appeared to afford no protection. In the third study globulin was used in a controlled study of a natural epidemic of rubella. The results were consistent with partial protection, but the figures were not statistically significant.

Thorn's Test with Extract of Posterior Lobe of Hypophysis—Corticotropin is the drug of choice in performing Thorn's test but, because of its high cost, Italian physicians have substituted epinephrine for it. The results with this drug, however, are not always reliable, and in doubtful instances the test has to be repeated with corticotropin. Recently the author has used an extract of the posterior lobe of the hypophysis that stimulates the adrenal cortex indirectly through the hypothalamic-diencephalic system. Thorn's test performed preopera-

tively in surgical patients acts like a trial stress on the organism and from the patient's hematological and metabolic reaction to it, it is possible to foretell how he will resist and react to the greater stress of the intervention. The author compared the results obtained with corticotropin, epinephrine, and the posterior pituitary hormone (Postipofisi) in 32 patients who were to undergo laparotomy because of gynecological lesions. Thorn's test was performed on successive days using a different drug each day. Doses used were 24 mg of corticotropin, 0.3 mg of epinephrine in a 1:1,000 solution, and 10 units of posterior pituitary hormone. All drugs were given subcutaneously. In 11 patients who were in good general condition and who showed no evidence of adrenal dysfunction, the test with corticotropin and posterior pituitary hormone indicated normal adrenal cortical function, whereas the test with epinephrine showed hypofunction in four of these patients. In 12 of the remaining 21 patients who were in poor general condition the test with epinephrine indicated hypofunction of the adrenal cortex, while the test with corticotropin and posterior pituitary extract indicated hypofunction in only 9. Seven of these nine patients proved to have neoplastic lesions. In all of these patients the ratio between the urinary uric acid and creatinine confirmed the blood findings. On the basis of these results, the author advocates the use of this extract of the posterior lobe of the hypophysis rather than epinephrine in Thorn's test.

Secretin in Patients with Gastrointestinal Diseases—The authors report on the results with secretin in the treatment of patients with diseases of the stomach, duodenum, pancreas, and biliary system. A dose of 8 mg, which after the first improvement was reduced to 4 mg, was given to the patients in two intramuscular injections before the main meals every day for 20 to 30 days. The results were good in 11 patients with chronic gastritis and satisfying in 8 with gastroduodenitis; dyspepsia decreased and sometimes disappeared, gastrointestinal function was restored to normal, and headache when present, disappeared. This hormone was especially helpful in patients with gastroduodenitis because it stimulated the pancreatic and biliary secretions, improved their circulation, and possibly had a direct action on the duodenum. Patients with chronic pancreatitis and dyskinetic and inflammatory alterations of the gallbladder and bile ducts were also benefited by the hormone, which increased the production of bile, improved its circulation, decreased its viscosity and mucin content and changed its pH. Improvement was also obtained in patients with atonic gallbladder diseases and biliary dyskinesia secondary to cholelithiasis or cholecystectomy. Secretin decreased the number of painful attacks and improved the efficiency of digestion. In eight patients with catarrhal jaundice secretin was most effective during the phase of resolution in that it accelerated the normalization of the liver and eliminated the digestive irregularities that are frequent in this period. Good results were obtained in 13 patients with chronic and acute colitis and enterocolitis. The secondary manifestations associated with hepatic and gastrointestinal disturbances disappeared quickly in all these patients, and thus the primary disturbance was improved. Urticaria disappeared in 7 of 16 patients who received the hormone, and there was slight improvement in two of seven patients with eczema. There were no signs of intolerance to the hormone. The patient's reactivity to secretin should be tested during the first days of treatment by using small doses (1 to 2 mg.) for the first injections.

Ménière's Syndrome and Its Treatment—Auditory impairment, tinnitus, and paroxysmal vertigo are the symptoms of Ménière's syndrome and are unaccompanied by organic nervous disorder or clinically demonstrable affection of the ear. The picture is dominated by the attacks of vertigo. The anatomic basis for the syndrome is thought to be increased labyrinthine pressure due to endolymphatic hydrops of the labyrinth. As the etiology of the labyrinthine hydrops is not clear the term "Ménière's syndrome" is preferred. A vestibular lesion can be demonstrated objectively in patients with Ménière's syndrome by quantitative rotation tests (cupulometry) and caloric stimulation according to Hallpike. Recruitment, pathognomic for a peripheral labyrinthine lesion, can readily be registered by audiometry. Conservative treatment is advantageous when the pathological changes in the labyrinth are reversible. At present it usually consists of restriction of salt and fluid intake and administration of ammonium chloride or of nicotinic acid and histamine according to Atkinson. Surgical treatment is indicated in incapacitating cases that have proved resistant to all forms of long-continued conservative treatment. Such cases are believed to make up from 10 to 20% of all cases of Ménière's syndrome. In treatment of unilateral cases Preber advocates a labyrinth operation rather than intracranial intervention with neurotomy, as it is equally effective in relieving the vertigo and is a less serious intervention and without risk of postoperative complications. The operative technique is still to be found that will relieve both vertigo and tinnitus without injury to the hearing. In the ear clinic of the Sodersjukhus conservative treatment of 106 cases of Ménière's syndrome gave improvement with regard to vertigo in 71%. In 29 cases surgical treatment was necessary.

Treatment of Venous Thromboses with Dicumarol Ethyl Acetate P Izarn —p 146
Aspiration Biopsy of Kidney B Saad —p 148

Diaphragmatic Hernia or Diaphragmatic Eventration and Venous Thromboses.—Repeated and apparently spontaneous venous thromboses in various parts of the body may be caused by diaphragmatic hernia of the stomach. Observation of four patients in whom venous thromboses accompanied diaphragmatic hernia or diaphragmatic eventration confirmed the causal connection between these conditions and established the im

portance of recognizing their coexistence as a new syndrome. Repeated small hemorrhages from the gastric mucosa and the hypochromic anemia frequently accompanying diaphragmatic hernia probably lead to a defensive hypercoagulability, which in turn results in venous thromboses. Surgical correction of the hernia or eventration may be necessary in some cases, but medical treatment should be tried first. Iron is the remedy of choice, because it may correct both the anemia and the thromboses, which tend to appear during episodes of anemia. Prolonged anticoagulant treatment, which might result in serious gastrointestinal hemorrhages, should not be given to patients with a history of repeated venous thromboses until the possibility of latent diaphragmatic hernia has been ruled out by radiological and other examination.

Carcinoma of Endometrium.—There are in the literature more than 100 cases in which endometrial biopsy showed carcinoma but the surgically removed uterus did not show carcinoma. Two cases are reported by the author in married women at the menopausal age. Both had gynecologic complaints of several years' duration. The uterus of the first woman, who had never conceived, had an increased volume (9 cm at hysterometry) and its surface was irregular. The Clark test for cancer of the uterus gave positive results. A curettage biopsy was diagnosed as showing glandular cystic hyperplasia and a focus of adenocarcinoma. The uterus and both adnexae were removed. The uterus showed signs of deep curettage and intramural myoma, but there were no remnants of the carcinomatous lesion. The second patient, who had four children, had a uterus of normal size. The neck of the uterus was held open by a protruding polypus, which slightly bled when touched with the forceps, came out with the forceps after a slight twisting and showed microscopically glandular hyperplasia and neoplasia with spreading to the lymphatics. The patient refused hysterectomy. Both patients regained normal health as soon as menopausal disorders were over. They are well 13 and 6 years after the operation and biopsy, respectively. The author states that biopsy does not show the degree of penetration of endometrial carcinoma and diffusion of the disease to nearby organs. He believes it advisable to follow Kaufman's classification of endometrial carcinoma, which includes group 0 in which carcinoma is found in tissues taken by curettage but not in the surgically removed specimen, group 1 in which carcinoma is restricted to the endometrium, group 2 with penetration to the myometrium but without reaching the serosa, group 3 with spreading to adjacent organs, and group 4 with extrapelvic metastases. The author concludes that a small early lesion of endometrial carcinoma can be entirely removed by biopsy. However, if surgery is resorted to the rational treatment of the disease is radical removal of the internal genital organs.

*Malignant Tumors in Epipharynx Review K Berg —p 128
Hydatid Cyst in Lung K Arnesen —p 132.

Malignant Tumors in Epipharynx.—Berg says that many malignant tumors of the epipharynx are overlooked, but the frequency of these tumors is estimated to be between 1/2 and 1% of all cancers. They are characterized by polymorphic, varying and often misleading symptoms. The clinical symptoms comprise local symptoms from the nasopharynx, due to growth of the tumor, symptoms from the ear, and symptoms of different kinds from cranial nerves. Diagnosis is often difficult. The primary tumor may be insignificant in size and over

shadowed by metastases and lesions of cranial nerves. Many of the patients are young, some of them children, and often the possibility of malignant tumor is not considered. Inflammation of glands in the neck, paralysis of cranial nerves, especially with paresis of eye muscles, or symptoms from the nerve group under the jugular foramen should call for the attention of an experienced rhinologist. Besides local examination with biopsy, examination of the regional lymph nodes, neurological examination, and roentgen examination should be routine procedures. The treatment is fractionated, protracted radiotherapy by the Coutard technique, extending over many weeks. The result depends on early diagnosis, radiosensitivity, tendency to metastasis, ways of metastasis, and tendency to recurrence. Radiosensitivity is not synonymous with radiocurability. Lymphosarcomas, reticulosarcomas, lymphoepitheliomas, transitional cell carcinomas, and the slightly differentiated carcinomas all react well to roentgen treatment, but the prognosis is affected by the marked tendency to recurrence and to metastasis. Freedom from recurrence after five years' control is reported in fully 20% of the cases in larger series. Recurrences are more resistant to radiotherapy, the patient cannot tolerate adequate doses, and the final prognosis is extremely unfavorable because of spread and supervening cachexia. In the more infiltrating forms spread to the membranes of the brain with secondary infection there or massive carotid hemorrhages may be the terminal stage.

Portacaval Shunt Operation with Vein Grafts—Theron discusses the operations in current use for cirrhosis of the liver, particularly the shunt procedures. The splenorenal technique seems indicated in extrahepatic block or in cases of Banti's syndrome in which hypersplenism is of such degree as to necessitate splenectomy. However, in the great majority of patients with portal hypertension due to hepatic cirrhosis, portacaval anastomosis more effectively reduces portal pressure. The author feels that Blakemore's more favorable results in comparison to other surgeons may be explained not so much by lesser technical ability of other surgeons but by the lack of adequate facilities for specialized investigation such as portal bed venography and measurement of liver blood flow and total circulating blood volume, together with detailed study of liver function and associated metabolic disturbances. Success in this operation is largely dependent on accurate selection of cases, and the routine tests of function frequently prove deficient, in that they fail to indicate liver damage constituting inoperability. Furthermore, inadequate preparation seems responsible for many operative deaths. The surgical technique recommended by Blakemore necessitates extensive mobilization of the portal vein, which is then divided and implanted into the inferior vena cava as an end-to-side anastomosis. More recently attempts have been made to create a side-to-side shunt with the object of preserving continuity of the portal vein. This method is frequently impracticable. The Blakemore operation is also open to criticism on the grounds that it often fails to reduce portal pressure adequately. In an attempt to reduce the operative mortality and to increase the efficiency of the portacaval shunt, Theron used vein grafts as a means of creating large H shunts between the two veins. Since August, 1951, four such operations have been performed with apparent success, in that the patency of the vein grafts has been maintained. A transverse upper abdominal incision is used. Mobilization of the duodenum and pancreas is restricted to a minimum. The free border of the portal vein is exposed sufficiently to allow the application of a Southwick clamp. Usually, mobilization of a 1 in (2.5 cm) segment of vein is adequate. An opening is made in the portal vein

and anastomosis of the vein graft performed. Everting mattress sutures are used to ensure intimal apposition. Suture of the vein graft to the inferior vena cava is facilitated by a curved clamp so as to produce only partial occlusion of the recipient vessel. The restricted mobilization of portal vein made possible by this technique reduces blood loss and operative hazard. The size of stoma is limited only by that of the vein graft. To date an autogenous graft of a segment of the superficial femoral vein has been employed, but now preserved segments of vena cava are available, and it is possible to create a stoma with a diameter larger than that of the portal vein so as to allow for postoperative fibrous contracture. With use of a clamp of the Southwick type the portal vein is not completely occluded during the anastomosis, thereby reducing the danger of subsequent mesenteric venous thrombosis. The continuity of the portal vein is preserved, the liver is not completely deprived of portal blood, and its regenerative powers are not unduly handicapped.

Poliomyelitis in Relation to Intramuscular Injections—Paralytic poliomyelitis has been reported following intramuscular injections of a variety of substances. In children of the Northern Sudan, cases resembling paralytic poliomyelitis had been observed to follow injections of quinine. The injections, which had been given into the buttock, had been followed after an interval of a few days or weeks by paralysis in the legs. When one buttock only had been injected, the paralysis was usually most marked in, or confined to, the corresponding leg. Cases of poliomyelitis without a history of injection were uncommon. Eight cases are presented that illustrate this condition. In seven children paralysis of the leg followed intramuscular injection of quinine within a month, and in one case, it followed the injection of penicillin. In instances where some form of trauma in an area precedes the onset of poliomyelitic paralysis, there are two possible explanations, either the poliomyelitis virus gained entrance from the exterior into the traumatized area, whence it ascended by the motor nerves to the corresponding anterior horn cells, or the poliomyelitis virus was present in the body before or shortly after the time when the area was traumatized. Although the contamination of syringes and needles with poliomyelitis virus cannot be entirely excluded, it seems highly improbable that it is the explanation for the considerable number of cases of poliomyelitis involving areas subjected to the trauma of injection. If the virus of poliomyelitis is present in the nervous system, and if the trauma caused a localized area of diminished resistance where the virus could proliferate rapidly, the relation of trauma to paralytic poliomyelitis would be explained. The authors cite literature reports indicating that various types of injections cause a more rapid proliferation of virus, and they feel that it is perhaps not remarkable that intramuscular injections of quinine should function in this way, since the intramuscular injection of quinine is known to cause necrosis at the site of injection. Poliomyelitis is a risk that must be taken into account in giving intramuscular injection of quinine and other irritant solutions to children.

BOOK REVIEWS

Biological Hazards of Atomic Energy Edited by A. Haddow. Being papers read at conference convened by Institute of Biology and Atomic Scientists Association, October 1950. Cloth \$8. Pp. 235 with illustrations. Oxford University Press, 114 Fifth Avenue, New York 11. Amen House, Warwick Sq., London E.C.4. 1952.

This book consists of 24 articles by different authors on various aspects of the injuries resulting from the impact of gamma rays and other ionizing radiations on living organisms. The early chapters deal with biochemical, genetic, and carcinogenic effects; others discuss the difficult problem of tolerance levels and the corresponding problem of protecting persons who work with atomic energy, and two concluding chapters deal with problems of ethics and citizenship.

The chapters vary in the amount of technical detail, but, in general, they avoid entanglement in minutiae, present a problem in interesting fashion, and give references to original publications. Protective measures taken in connection with the atomic reactor at Harwell, England, and at the Institute of Radiophysics in Sweden are especially interesting. Of practical concern to many physicians is the chapter on the control of hazards and irradiation in the clinical use of radioiodine. The book has author and subject indexes and is illustrated. It is a commendable work.

Diagnostic Manual in Speech Correction: A Professional Training Work book. By Wendell Johnson, Ph.D., Professor and Chairman of Council on Speech Pathology and Audiology, University of Iowa. Iowa City. Frederic L. Darley, Ph.D., Assistant Professor of Speech Pathology and Audiology, and D. C. Sprlestersbach, Ph.D., Associate Professor of Speech Pathology and Audiology. Loose leaf paper \$2.50. Pp. 221. Harper & Brothers, 49 E. 33rd St., New York 16. 1952.

This monograph is composed of 22 units that describe and explain methods of diagnosing and recording speech performance. Nineteen different test forms to be completed in the examination of the person with defective speech are included. The basic units and appendixes of the text explain and assist in the proper completion of these forms. The examination forms cover such subjects as voice and connected speech examination, articulation testing, peripheral speech mechanism examination, examination of harshness, examination of nasality, introduction of stuttering, Iowa scale of attitude toward stuttering, Iowa unimanual and usage questionnaire, and rating sheets for student clinicians. This monograph is written primarily for use by educators interested in diagnosis and correction of speech defects, but it will also be of interest to physicians concerned with total rehabilitation.

Office Management of Ocular Diseases. By William F. Hughes, Jr., M.D., Professor and Head, Department of Ophthalmology, University of Illinois College of Medicine, Chicago. Cloth \$9. Pp. 452 with 120 illustrations. Year Book Publishers, Inc., 200 E. Illinois St., Chicago 11. 1953.

This book presents current diagnostic and therapeutic procedures found useful and effective in the office management of ocular diseases. Discussion of techniques is generally limited to those with which the author is familiar, and the bibliography lists only references that amplify the text, comment on a controversial topic, or describe techniques untried by the author. Practical hints on techniques of examination and interpretation of findings, extensive tables on differential diagnosis, and informative sections dealing with chemical burns and beta radiation are commendable features. The concluding section provides a helpful ophthalmologic formulary, including conversion tables and calculation of dosage for infants and children. The book should be of practical value to all physicians who treat patients with ocular diseases in the office.

Analgesia and Anesthesia in Obstetrics. By J. P. Greenhill, M.D., Professor of Gynecology, Cook County Graduate School of Medicine, Chicago. Publication number 159, American Lecture Series, monograph in American Lectures in Gynecology and Obstetrics. Edited by E. C. Hamblen, M.D., F.A.C.S., Professor of Endocrinology, Duke University School of Medicine, Durham, North Carolina. Cloth \$2.75. Pp. 85 with 16 illustrations. Charles C. Thomas, Publisher, 301 327 E. Lawrence Ave., Springfield, Ill. Blackwell Scientific Publications Ltd., 49 Broad St., Oxford, England. Ryerson Press, 299 Queen St. W., Toronto 2B. 1952.

This monograph briefly presents the author's views on the management of analgesia and anesthesia in obstetrics. The subject is discussed more from the viewpoint of an obstetrician than from that of an anesthesiologist. The book is divided into 11 chapters containing abbreviated descriptions of techniques, with the notable omission of continuous spinal anesthesia.

The book appears too hastily compiled. The author divides the presentation of material concerning subarachnoid block, and his opinions regarding this procedure, as well as the advisability of the use of pituitary extract, are not in agreement on different pages. The discussion of thiopental (Pentothal) sodium is not up-to-date with regard to its pharmacological action and the need for additional oxygen or nitrous oxide-oxygen analgesia to prevent anoxia. Other safeguards are omitted. The suggested margin of 10% oxygen with nitrous oxide is inadequate. The author's opinion on the use of infiltration anesthesia for dilatation and curettage in the presence of infection is not universally accepted. Some clinicians have found this method of anesthesia inadequate for permanent repair of childbirth lacerations, particularly when rectocele is a complication.

This book, however, will be of interest to general practitioners, obstetricians, gynecologists, and anesthesiologists. A short bibliography and an adequate index are included. The illustrations, quality of printing, and general format are excellent.

Ciba Foundation Colloquia on Endocrinology. General editor for Ciba Foundation, G. E. W. Wolstenholme, O.B.E., M.A., M.B. Assisted by Margaret P. Cameron, M.A., A.B.L.S. Volume I: Steroid Hormones and Tumour Growth and Steroid Hormones and Enzymes. Volume II: Steroid Metabolism and Estimation. Volume III: Hormones, Psychology and Behaviour and Steroid Hormone Administration. Volume IV: Anterior Pituitary Secretion and Hormonal Influences in Water Metabolism. Cloth \$6. \$6.75. \$6.75. \$7.50. Pp. 315 with 48 illustrations. 429 with 96 illustrations. 380 with 78 illustrations. 591 with 139 illustrations. Blackiston Company (division of Doubleday & Company, Inc.), 575 Madison Ave., New York 22. 1952.

The Ciba Foundation in 1949 established an international center in London where research workers are encouraged to meet informally and exchange ideas and information. The foundation has sponsored several international symposiums at which outstanding workers from throughout the world have gathered. The proceedings of nine of these meetings, which have dealt primarily with the steroid hormones, have been collected in these four volumes. In addition to the formal addresses by the participants, the informal discussions of the papers are included. As a result of the informality and intimacy of the meetings, the discussions often include much previously unpublished as well as published work. The topics covered are too numerous to be listed here, but in every case the material is the most recent available. Unlike many symposia, these are presented in a format comparable to the high level of the presentations. They are illustrated with excellently reproduced photomicrographs and line drawings. Ample references are appended to each article, and each volume is separately indexed. The Ciba Foundation is to be commended for its support of these colloquia, which will serve research workers and others interested in steroid hormones. These volumes may be commended without reservation, not only to workers in endocrinology but also to internists desiring a survey of the current research in this field.

Dermatology: Essentials of Diagnosis and Treatment By Marion B Sulzberger M.D. Professor and Chairman Department of Dermatology and Syphilology New York University Post-Graduate Medical School New York, and Jack Wolf M.D. Associate Professor of Clinical Dermatology and Syphilology New York University Post Graduate Medical School Fourth edition Cloth. \$10 Pp 592 with 65 illustrations. Year Book Publishers Inc 200 E. Illinois St. Chicago 11 1952.

This volume, published through three editions under the title 'Dermatologic Therapy in General Practice,' has been revised to include recent advances in therapy and has been given a new title to acknowledge the importance of the sections on diagnosis that open each chapter. It presents lucidly and authoritatively the practical details of diagnosis and treatment of the commoner dermatoses and of syphilis. The authors have written especially for the student and general practitioner, but the postgraduate student of dermatology will find the book helpful. Basic principles of dermatological history taking, examination, and treatment are outlined before specific dermatoses are considered in detail. The rationale of various types of topical therapy is explained clearly in the chapter on principles of topical medication. Throughout the book, the details of treatment are so explicit and so well illustrated that even the beginner in dermatology should have no difficulty in applying them. In each chapter the authors attempt to give perspective and counsel, and the whole subject is presented conservatively. The book is attractively printed and bound and is adequately indexed. It is one of the most practical books in its field.

Handbook of Orthopaedic Surgery By Alfred Rives Shands Jr. B.A. M.D. Medical Director of Alfred I. duPont Institute of Nemours Foundation Wilmington Delaware. In collaboration with Richard Beverly Raney B.A. M.D. Professor of Surgery in Orthopaedic Surgery University of North Carolina, Chapel Hill North Carolina. Fourth edition. Cloth \$8 Pp 644 with 191 illustrations by Jack Bonacker Wilson and others. C.V. Mosby Company 3207 Washington Blvd. St. Louis 3 1952.

The author is an outstanding specialist and has made many contributions to orthopedic surgery. He writes clearly and is an accurate observer. In this edition he has added 10 short sections to the text. The book contains many clear instructive line drawings. Some roentgenograms have been retained, other illustrations have been redrawn.

In a few places, the book is not up-to-date. This may be attributed to the fact that some current methods are controversial. In the treatment of tuberculosis of bones and joints no mention is made of the nicotinamides. Under the local treatment of arthritic joints there is no mention of the use of hydrocortisone (compound F). The author also fails to mention the use of probenecid (Benemid) in the treatment of gout. No mention is made of phenylbutazone (Butazolidin) in the treatment of arthritis and allied conditions. Injuries of the lumbar intervertebral disks are allotted only two pages, little more than disorders of the coccyx are allotted. In figure 23 it is evident that the artist did not understand the point in question. In general however, this is an excellent book for its purpose and reflects a conservative point of view.

The 1952 Year Book of Drug Therapy (August, 1951 August, 1952) Edited by Harry Beckman M.D. Director Departments of Pharmacology Marquette University Schools of Medicine and Dentistry Milwaukee Cloth \$5.50 Pp 606 with 114 illustrations. Year Book Publishers Inc. 200 E. Illinois St. Chicago 11 1952.

Rapid advances in medicine make it necessary to have frequent abstracts of important papers available for those who are not actively working in a particular field. For that purpose in the field of therapeutics this book is unusually good. The volume covers many subjects, and of course, emphasizes the drugs that are now being developed and investigated. Adreno corticotropic hormone, cortisone, and hydrocortisone (compound F) are accorded a good deal of attention. There is a good discussion of fungus infections and their response to the antibiotics. The therapeutic agents used in neoplastic diseases are well covered. In the space of a small volume, abstracts on many topics of current interest and references to the original articles are included. This volume will prove very helpful and time saving to practitioners and also to teachers of medical students.

Dermatology: A Textbook for Nurses By Herbert Rattner M.D. Professor and Chairman Department of Dermatology Northwestern University Medical School Chicago Cloth \$4.25 Pp 270 with 100 illustrations. W.B. Saunders Company 218 W. Washington Sq. Philadelphia 5 7 Grape St. Shaftesbury Ave. London W.C.2 1953.

This small book is based on a series of lectures that comprise the course in dermatology for student nurses at Cook County Hospital, Chicago. The author has attempted "to acquaint the nurse with the fact that the skin is a structure with its own diseases, regulated by its own laws, to help her to recognize that some cutaneous diseases are contagious but that the vastly greater number are not, to stimulate her to appreciate the special nursing problems created by diseases of the skin, and to afford her an intelligent appreciation of the many unsolved problems of dermatology." The first lectures deal with the structure, function, and care of the normal skin, the general types of skin lesions, and the basic principles of topical treatment. Subsequent chapters present the symptoms and findings of the commoner dermatoses and syphilis, with brief remarks on treatment. The presentation is simple and concise and is supplemented with a number of clinical photographs. The book is attractively printed and bound and has an adequate index. It should prove helpful to nurses, teachers, and even to medical students as an introduction or supplement to the more encyclopedic texts.

The Metabolism of Protein Constituents in the Mammalian Body By S. J. Bach Cloth \$9.25 Pp 272. Oxford University Press 114 Fifth Ave. New York 11. Amen House Warwick Sq. London, E.C.4 1952.

This monograph fulfills a definite need, for the last comparable work on the biochemistry of amino acids was published in 1929. Although the scope of the book is limited to 10 constituents of proteins, to metabolism proper, and to mammals, almost 1,200 references are cited, most of them not more than 15 years old and many published in 1951 and 1952. In addition, Dr. Bach is thoroughly familiar with the field and has the gift of being able to make it interesting to others. The author and subject indexes are comprehensive, and the printing and binding are excellent. This monograph is recommended for graduate students, research workers, and teachers of biochemistry and physiology.

Refresher Course for General Practitioners. Specially commissioned articles from *British Medical Journal* First collection October 1949 to December 1950. Cloth 25/- Pp 486 with illustrations. British Medical Association 19 Tavistock Sq. London W.C.1 1952.

This book consists of 55 articles by well-known British clinicians on medical problems commonly encountered by the general practitioner. Some of the topics discussed are acute throat, management of the premature baby, the influenzal diseases, causes and treatment of eczema, cardiac neuroses, acute abdominal disease, infant feeding, and the management of diabetes mellitus. The articles were originally published two years ago in the *British Medical Journal* and were published in book form to provide a review of established practices and to present newer advances in a simple, straightforward fashion. The book is well printed and generously illustrated. Practicing physicians and students alike should enjoy its contents.

Diseases of the Esophagus. By Philip Thorek, M.D. F.A.C.S. F.I.C.S. Associate Clinical Professor of Surgery (formerly assigned to Gross and Topographical Anatomy) University of Illinois College of Medicine Chicago Cloth \$10 Pp 140 with 102 illustrations drawings by Carl T. Linden Assistant Professor of Medical Illustration University of Illinois College of Medicine J.B. Lippincott Company 227 231 S. Sixth St. Philadelphia 5 Aldine House 10-13 Bedford St. London W.C.2 2083 Guy St. Montreal 1952.

This short book should prove to be of interest to physicians interested in diseases of the esophagus. Normal anatomy and physiology are discussed, and methods of examination and diagnosis are outlined. Diagnosis and treatment of diseases affecting the esophagus are reviewed, and a brief discussion of tumors is included. There are many references, but the details of newer studies are not given. The book's greatest value lies in its excellent illustrations and the discussions of operative technique.

USE OF TOBACCO AND ALCOHOL BY ULCER PATIENTS

TO THE EDITOR—A patient, aged 63, had a gastrectomy because of a chronic duodenal ulcer and a posterior perforation. The gastroenterologist recommended a bland diet for four months, then permitted a full diet with moderate smoking and occasional drinking of alcoholic beverages. The surgeon absolutely forbade smoking and was noncommittal about the need for a diet. This puts me in the middle. What is the recommended postgastrectomy diet regimen? What is the consensus on smoking or occasional use of alcoholic beverages?

M D New York

ANSWER—Patients with duodenal ulcer almost invariably secrete from 3 to 30 times as much gastric juice in the empty stomach during fasting as is found in normal persons. They also secrete several times as much gastric juice in response to the stimulus of food taking. There is much reason to believe that this excessive secretion of gastric juice is the chief factor in producing the duodenal ulcer and in maintaining its chronicity. The value of subtotal gastric resection in the treatment of duodenal ulcer depends not only on the fact that the ulcer is removed but also on the fact that the secretion of gastric juice is greatly decreased. This decrease is accomplished through removal of the antrum and also a large part of the body and fundus of the stomach containing the acid secreting gastric glands. If the secretion of gastric juice has not been reduced below the amount found in normal persons, gastrojejunal ulceration is apt to develop. Valuable information concerning this point can be secured by measuring the nocturnal secretion produced by the gastric remnant. In this case, the indwelling gastric tube must be accurately placed, under fluoroscopic control. It should be emphasized that the nervous or vagus mechanism of gastric secretion is not eliminated by the operation, and the gastric remnant is still bombarded by secretory impulses arising as a result of nervous tension and emotional conflict. Since both smoking and the consumption of alcohol are potent stimuli for gastric secretion, their use undoubtedly increases the hazard of gastrojejunal ulcer formation. If the hypersecretion of gastric juice has not been entirely eliminated by the operation, additional unnecessary stimulation should certainly be avoided.

ARACHNOIDITIS

TO THE EDITOR—I am treating a 59-year-old woman for arachnoiditis, which apparently is diffuse in the lower vertebral segments and which has been proved by laminectomy and biopsy. She has had nerve root pain over the perineum and in the legs for three years, and for six months there has been a relative atony of the urinary bladder and the bowel. I am interested in opinions on treatment with roentgen rays and with cortisone or related drugs.

Harold E Eisele, M D Los Angeles

ANSWER—There is no evidence that x-ray therapy would be of any value in the treatment of an arachnoiditis in the lower part of the spinal canal. While no reports of treatment of this condition with cortisone are available, there seems to be no reason to believe that it would prove efficacious, on the other hand, there is no reason why it should not be tried. If the pain in this case is sufficiently severe to warrant it, either a cordotomy or a posterior root section may be considered. Unfortunately, neither surgical procedure could be expected to result in any improvement in the condition of the bowel or bladder, in fact, either one might make these functions worse.

The answers here published have been prepared by competent authorities. They do not however represent the opinions of any official bodies unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

PARESTHESIA FOLLOWING FRACTURE OF CERVICAL SPINE

TO THE EDITOR—A 69-year-old man fell downstairs 15 months ago sustaining a fracture dislocation at the fifth and sixth cervical vertebrae. After treatment consisting of use of Crutchfield tongs, a neck brace active and passive exercise, diathermy, and galvanic muscular stimulation much atrophy and spasticity of the upper extremities and to a lesser degree of the lower extremities have resulted. The patient walks with a drag of the right foot and spasticity in both legs. He has limited use of the arms with only about 30 degrees flexion function remaining. For six months his chief complaint has been paresthesias of the arms and legs, which he says make them feel as though they were in boiling water. Please advise some treatment for this burning sensation. A course of mephenesin (Tolserol) and vitamin B₁₂ has been of no value. Circulation in the feet is good.

Gerard Del Grippo, M.D., Lock Haven, Pa.

ANSWER—There is no treatment known to be of value for paresthesias in the extremities following fracture dislocation of the lower cervical spine. Medication probably would prove entirely worthless, and it is unlikely that any form of surgical treatment would be beneficial. Naturally, one would think of the possibility of a cordotomy in a patient complaining of pain in the extremities, however, this patient's discomfort can hardly be described as pain, and it seems unlikely that a cordotomy would relieve it. Furthermore, a cordotomy could not be performed sufficiently high to give relief of pain in the upper extremities, even if it proved effective for the discomfort in the lower extremities.

WHISTLING NOISE OVER TEMPORAL AREA

TO THE EDITOR—A girl, aged 3, has a whistling noise over the left temporal area and occasionally on the right side, also. This is synchronous with the pulse rate and is more audible at some times than at others. There is no thrill palpable, the sound is not heard over the vessels of the neck on either side and there is no heart murmur. She was not an erythroblastotic baby and had a normal delivery with no difficulty or even use of instruments. She has been well, except for a mild case of poliomyelitis at 1 year of age and pneumonia four months ago. This noise was heard by the mother when the child was 10 months old. She occasionally complains of headache and will lie down for 5 to 10 minutes and then will be playing about as usual. Would this be due to an arteriovenous aneurysm, and, if so, where would it be located? Would the headaches be caused by this? Is there any surgical treatment that might be of value in this condition?

G H Purves, M D, Hendricks, Minn.

ANSWER—In all probability, the bruit synchronous with the heart beat that is heard in the left temporal region in this patient is the result of an arteriovenous fistula. This is probably a congenital anomaly of the vascular system, most likely located on the left side of the head and near the point at which the bruit is heard most loudly. The exact location of the abnormality could be determined only by a cerebral angiogram. The bruit alone would hardly be sufficient reason to make an angiogram or to consider any surgical treatment of this lesion. If at a later date neurological abnormalities develop that are sufficiently severe to warrant such treatment, an angiogram should first be made and then surgical intervention considered. There are so many causes for headache that it would be impossible to state from the evidence given whether the headaches are the result of this abnormality. Many such patients can be treated satisfactorily by excision. What difficulties an operation of that type would entail and what the risks would be would depend on the nature and location of the lesion. In any event, it would not be wise to consider such treatment at this time.

INFLUENZA VACCINE

TO THE EDITOR—*What is the present status of influenza prevention by means of immunization? What is the likelihood of either inducing an allergy to egg protein or precipitating a reaction in persons allergic to egg protein by the use of such agents prepared from chick embryos?*

M D, Kentucky

ANSWER—In controlled studies, the available influenza virus vaccines have been found to prevent infections due to the strains of virus contained in the vaccines. The present vaccine composition includes strains that have been occurring in recent years. The degree of protection afforded appears to be about 75%. The use of vaccine in population groups and in family groups rather than in isolated persons would afford a greater degree of protection, because of the reduced likelihood of exposure in groups in which the proportion of susceptible persons has been reduced below the critical level necessary for the disease to spread. It now appears that repeated injections of vaccines made from chick embryo material or the extra embryonic fluids of the embryo do not induce clinical allergy to egg or embryo protein, however, in persons known to be sensitive to eggs, severe reactions are likely to occur. It is recommended, therefore, that vaccines prepared from egg material not be given to persons who are known to be egg-sensitive. If the question of egg sensitivity is asked prospective vaccinees and vaccine is not given to persons with known egg allergy, the procedure appears to be entirely safe.

PSORIASIS AND CLIMATE

TO THE EDITOR—*Would it be advisable for a patient with generalized psoriasis to move to an area with a warmer climate from one in the temperate zone, such as San Francisco? Is there a direct correlation between the lessening of severity of psoriatic arthritis and that of skin lesions? If the arthritis is once established would it tend to remain or may it be expected to subside? Is there any specific area in the country in which the incidence is especially low?*

M D, California

ANSWER—Many factors are involved in generalized psoriasis, with or without arthritis. Climate is only one. It would be foolish for the patient to move from San Francisco to a region with a favorable climate, such as southern Arizona, without a six months' trial residency in the latter location. There seems to be no correlation between the lessening of severity of psoriatic lesions and that of arthritic lesions in a given patient. Arthritis, once established, usually remains. There is no specific area in the country in which the incidence is especially low.

REPAIR OF HERNIAS WITH TANTALUM GAUZE

TO THE EDITOR—*I would like information concerning the repair of ventral and inguinal hernias with tantalum gauze. Should the gauze be placed over or under the fascia? What type of suture is preferable? What is the proper after-care? Where in this area may the gauze be purchased?*

Henry C Scholer, M D, Monmouth Ill

ANSWER—In this consultant's experience in 70 cases of postoperative ventral hernia, it has been found advisable to place the tantalum gauze over the fascia and to cover it with a sheet of fascia lata. The addition of fascia lata is especially important in cases in which there is a thinning out of the skin and subcutaneous tissues of the abdominal wall, since tissue reaction is reduced and healing is promoted. When tantalum gauze is placed directly beneath thinned-out skin and subcutaneous tissues, foreign body tissue reaction may be initiated and the gauze may be extruded. It is also essential to prepare a groove or gutter in the margin of the defect in the abdominal wall so that the edges of the tantalum gauze are covered with muscular or fascial structures. The tantalum gauze is sutured in position with no 000 braided tantalum or stainless steel sutures, and the overlying fascia lata is maintained in position with the same type of suture. Concerning aftercare, the following points should be remembered. Gastrointestinal intubation is begun before the operation and continued until peristaltic activity is restored. In general, the principle of early ambula-

tion should be followed, because pulmonary congestion and atelectasis are best avoided by this measure, and coughing and distension, the two most hazardous complications of this operation, are largely eliminated. The special scultetus binder should be applied to the abdomen before ambulation is begun, especially when the defect is large. The tantalum mesh gauze may be purchased from any of the large surgical supply houses or directly from Ethicon Suture Laboratories, New Brunswick, N J.

SENSITIVITY TO COTTONSEED

TO THE EDITOR—*A woman, aged 47 had one attack of asthma that required hospitalization. While there had been no previous similar episodes, for several years she had periodic feelings of extreme fatigue, shortness of breath and a feeling of being too tired to breathe. During the recent episode for which she was hospitalized, skin tests showed sensitivity to cottonseed oil, house dust, ragweed and Alternaria. Her attending physician feels that hyposensitization to cottonseed oil cannot be accomplished and that this sensitivity can be controlled only through rigid dietary procedure. I would appreciate advice on hyposensitization to cotton seed oil.*

M D, Illinois

ANSWER—There are several reasons why hyposensitization to cottonseed oil is not to be advised in this case. 1 A positive skin reaction to cottonseed protein does not mean that the patient is allergic to cottonseed oil. In the vast majority of instances of cottonseed sensitivity, the oil can be tolerated with impunity. Biological investigations of cottonseed oil do not indicate that it has any appreciable cottonseed antigen. 2 A positive reaction to cottonseed means that the patient could have trouble from the ingestion of cottonseed meal (such as were used in health breads) and from the inhalation of dust from cotton linters, such as is found in mattresses and furniture stuffing. 3 One attack of asthma, even when the cause is known and when desensitization is specific and safe, does not justify the extended period of injections ordinarily required in specific therapy. 4 The cottonseed antigen is a potent antigen, and desensitization with it is a truly hazardous procedure. It is seldom indicated. It is suggested that the patient disregard any dietary restrictions aimed at the elimination of cottonseed oil. If asthma recurs frequently, other factors, allergenic and otherwise, should be considered.

ULTRAVIOLET RAYS IN BARBER SHOPS

TO THE EDITOR—*We are trying to change the sanitary regulations governing barber shops in this state. The barber industry insists that ultraviolet light is effective as a germicidal and/or fungicidal agent, and it proposes to answer our insistence that more effective sterilization is needed by installing ultraviolet light units in the shops. Kindly furnish pertinent information that you have.*

C H McCuiston, M D, Austin, Texas

ANSWER—To kill microorganisms, a direct hit by ultraviolet rays of sufficient intensity is required. This is difficult to accomplish when organisms are on the edge of a drinking cup, between the teeth of a comb, at the base of the bristles of a brush, on the overlapping surfaces of scissor blades, in liquid containing suspended matter, or in air laden with dust particles that shield the organisms. To provide adequate sterilization, a germicidal application must effect killing of 100% of the organisms present. Ultraviolet germicidal rays cannot penetrate deeply and may be absorbed by finger marks, saliva, cosmetics, or other contaminations in a drinking cup, comb, brush, or other utensil. The ultraviolet germicidal lamp is, therefore, an uncertain means of sterilizing solid objects, even if irradiation of the whole surface is possible. Also, if ultraviolet germicidal lamps are used to irradiate shelves and containers, in which freshly sterilized and clean utensils or barber tools are stored, then adequate protection is required to prevent ultraviolet ray burns of the hands and arms of the attendants who manipulate these utensils.

EXTRA MILK FOR WELDERS

TO THE EDITOR—In an industrial firm, the question of provision of milk to welders is frequently raised. Men engaged in this occupation regularly follow a practice of consuming extra quantities of milk, and it is their firm belief that this counteracts the toxicity of the fumes to which they are exposed. Is there any scientific evidence to support this belief?

W. Burton Ayre, M.D., Montreal, Quebec

ANSWER—An extra intake of milk is commendable, but the benefit is chiefly related to vitamin levels. The action of nitrogen oxides on the respiratory tract initially and primarily is local. Some welding work is attended by unusual thirst that is not easily satisfied. Some welders and galvanizers believe that milk best meets this need. Certainly milk consumption may not be relied on as constituting adequate protection against harmful concentration of either welding gases or metal fumes.

TINNITUS

TO THE EDITOR—A woman, aged 62 who has had hypertension (systolic pressure 270 to 220 mm Hg diastolic pressure 120 to 100 mm Hg) for 15 years now complains of persistent ringing in her ears. Results of physical examination are essentially normal, and she has no apparent ear involvement. What therapy can you suggest to alleviate her condition?

Maurice M. Schrier, M.D., Brooklyn

ANSWER—It is questionable whether the tinnitus in this patient is necessarily related to the hypertension. Tinnitus occurs just as frequently independently of vascular disorders. The treatment of tinnitus aurium is unsatisfactory; there is no specific remedy. Raising the hemoglobin to an optimum level may help, but there is no assurance of this.

LABORATORY TESTS IN INCOMPLETE ABORTION

TO THE EDITOR—In the case of an incomplete abortion, what is the significance or value of an Aschheim Zondek, a Friedman, or a frog test? For how long will these tests give positive results? If placental tissue remains attached to endometrium, do these tests give positive results?

Jerome C. Pierce, M.D., Chicago

ANSWER—A negative result in an Aschheim Zondek, a Friedman, or a frog test in the presence of an incomplete abortion indicates that the placental tissue is not producing gonadotropic hormones, but it does not indicate an absence of placental tissue. If placental tissue remains attached to the endometrium and produces gonadotropic hormones, the test continues to give a positive result. Usually, results of a biological test become negative about eight days after delivery or removal of placental tissue.

ROENTGENOGRAPHIC STUDIES DURING PREGNANCY

TO THE EDITOR—I would like to inject a note of sober realism into the discussion on Roentgenographic Studies During Pregnancy in *THE JOURNAL* March 21, 1953, page 1054. It is true that the fetus is more radiosensitive during the first trimester of pregnancy than at a later stage of development, but it is also true that it is most susceptible to radiation during the first two weeks after its conception. Moreover, in roentgen diagnostic procedures that are employed far more frequently such as studies of the gastrointestinal tract, a considerably greater amount (4 to 20 times as much) of roentgen rays will be delivered to the region of the uterus than in roentgen pelvimetry. According to conservative estimates more than a million barium enema studies and an even greater number of gastrointestinal x-ray studies are performed in this country each year. Assuming that half this number are done on women and realizing that radiologists seldom confine their examinations to the first 10 days following a normal menstruation, which they should do if x-ray pelvimetry is harmful, some reevaluation of this problem appears in order. The number of women who have undergone x-ray studies within the first two weeks of their as yet

unsuspected pregnancy over the last 20 years must be staggering. If any ill effect on a fetus has resulted from this practice, it should be known by now. If new and definite evidence of such ill effects has accumulated recently, it should be brought to the attention of the medical profession. Until then I believe the best that obstetric radiology has to offer to the referring physician is a simple pelvimetric examination in the earlier part of the patient's first pregnancy (dose to fetus 0.5 to 2 r), visualization of the fetus after the 24th week for the detection of obvious abnormalities and for fetal age determination as part of routine prenatal care and a more elaborate cephalopelvimetric examination near term, whenever an uncertainty about cephalopelvic disproportion remains.

DARK BROWN MOLE

TO THE EDITOR—In *Queries and Minor Notes* in *THE JOURNAL* March 21, 1953, page 1051, is the answer to a query on the handling of a nevus "irregular, dark brown, 1½ cm in diameter, intracutaneous, not raised, and not ulcerated." The inquirer is advised that "the area should be widely excised down to the fascia." I believe that most dermatologists and many pathologists will consider this advice unnecessarily radical. The fact that such a lesion on the posteromedial aspect of the lower leg has slightly increased in size in the past year after being present for many years certainly does not excite enough suspicion of malignancy to justify such radical treatment. If every such lesion, regardless of location, were excised widely and down to the fascia, we would indeed be a deeply scarred race. I believe that most pathologists will agree that local excision (as suggested by the writer of the query) for biopsy would be adequate treatment. If biopsy indicates that the lesion is a junction nevus showing activity or a malignant lentigo, wider and deeper excision can be carried out after the biopsy, without danger of metastasis being increased by the short delay.

EVANESCENT MASS IN SUPRACLAVICULAR FOSSA

TO THE EDITOR—In *THE JOURNAL* Feb. 21, 1953, page 696 in the query on 'Evanescent Mass in Suprclavicular Fossa' Dr. Ramon A. Barrera describes a soft swelling of changeable size above the left clavicle. This sort of swelling is not unlike the so-called hydrocele of the neck, a cystic swelling somewhat similar to the cystic hygroma of infancy but occurring in adults in this particular location. These are multilocular cysts with thin endothelial walls, lying deep in the neck and extending down into the thorax and even into the axilla. They have a tendency to vary in size. The diagnosis can be established by aspiration. Normally the cysts contain a clear, straw-colored fluid that coagulates on standing. Hemorrhage into them, however, is common, and the needle may withdraw what appears to be pure blood. A blood cell count will reveal that it is not similar to the peripheral blood.

INFECTION OF SEMINAL VESICLE

TO THE EDITOR—With regard to Dr. Benjamin Berger's inquiry in *THE JOURNAL*, Feb. 7, 1953, page 533, about the treatment of hematospermia, may I add that vasotomy with injections of an appropriate antibiotic, as determined by culture and sensitivity tests, or the alternate instillation of Collargol (a colloidal silver preparation) may be helpful. Another method that has been found successful in hematospermia of unknown origin is the use of estrogenic hormones described by Huggins and McDonald (*J. Clin. Endocrinol.* 5:226, 1945).

RED BLOOD CELLS AS SOURCE OF PROTEIN FOR PARENTERAL USE

Major N O Calloway

and

Col F H Mowrey, (MC), U S Army

The most concentrated solutions of protein that normally can be given intravenously are 4 to 5% solutions of proteins or amino acids. It is necessary to give the patient tremendous quantities of fluid to provide adequate quantities of protein. Other substances in the form of solutes, such as sodium chloride, are administered simultaneously, since they are part of the manufactured product utilized as a source of protein or amino acids for intravenous administration. We have found no references in the literature to any type of substance that could be given intravenously that would contain as much protein as a similar volume of packed red cells. Packed red cells contain 30% hemoglobin, this means that 300 cc of packed red cells will contain 90 gm of protein as hemoglobin, whereas 1,600 cc of the ordinary solutions of amino acids or proteins, given over a long period, are required to furnish the same amount of protein.

If it were feasible to use the red cell as a source of protein, it would be possible to give large quantities of protein intravenously from small volumes of packed red cells that have been freed of solutes. This frequently is desirable in debilitated states, such as cirrhosis, nephrosis, or even cardiac disorders, in which protein is needed. It appeared to us to be entirely possible to utilize the red cell as a source of such protein without at the same time overburdening the patient with sodium chloride or fluids that may add to the severity of his fluid imbalance. If red cells could be used for this purpose not only would a source of concentrated protein become available but at the same time a use would be found for the tremendous quantity of red cells that are accumulated in the collection of blood and plasma by the American Red Cross, the armed forces, and private institutions. It has been estimated that 1.5 billion cc of red cells

are discarded each year. This number of red cells contains the staggering quantity of 500 million gm of hemoglobin. This amount of hemoglobin, if it can be used as a source of protein for intravenous administration, equals the tremendous amount of ready synthesized human protein.¹ This is sufficient protein to raise the serum protein level from 5 to 7 gm per 100 cc in 333,000 patients, allowing 1,500 gm per patient. It has been shown² that globin separated from the heme part of the molecule is an excellent source of protein. It further has been shown that this material will maintain nitrogen balance in human beings, however, 2,500 cc were required to furnish 79 gm of protein over a period of 10 days. The rate of administration is extremely slow, the volume of fluid is high and the amount of protein administered is small.

Many suggestions may be found for the use of packed or resuspended red cells in various anemias.³ Statements may be found in the literature to the effect that the main value of a red cell transfusion is to increase the erythrocyte count.^{3b} While this is probably true, such expressions have delayed any study of the red cell as a source of protein. Suggestions have been made in the literature that red cells (even old red cells) be used in treatment of debilitated states and that they be used directly or in diluted form. It has been pointed out⁴ that red cell administration may be used in place of transfusions. In most of these studies red cells were used for replacement of hemoglobin and to supply the patient with oxygen transporting ability only. On the other hand, it has been pointed⁵ out that type "O" cells may be used and that cells and serum need not always be matched type for type. It also has been suggested⁶ that reactions occur less frequently with packed red cells than with whole blood. This

communication is a preliminary report on our observations on the use of red cells as a source of protein for parenteral use

METHOD AND MATERIALS

We have studied eight patients in an effort to obtain information on the possible use of red cells as a source of protein, edematous patients with cirrhotic livers,

Fig 1 (case 1)—Course of a patient with hepatic cirrhosis before and during administration of packed red blood cells

nephrotic patients, and one patient in heart failure with the hepatomegaly of so-called cardiac cirrhosis. All patients were kept on the ward for varying periods to ascertain the clinical trend prior to the beginning of the administration of red cells. All patients were placed on diets that contained fixed 24 hour intakes of protein, carbohydrates, and fat and a sodium intake of about 250 mg. In all cases, daily weight determinations and periodic red blood cell counts and hemoglobin and serum protein level determinations were done.

The red cells used in this study were obtained from blood by simply decanting the plasma or as cells resuspended in corn syrup from the Red Cross bank at Lansing, Mich., from which we obtained much of our blood. In no case did a transfusion reaction or any difficulty with the use of the blood occur. Attempts to resuspend cells after washing in 5% dextrose solution led to disappointing results. The cells underwent hemolysis, they stuck together in large aggregates, their color changed, and they became generally useless. Most of the cells used in this study were old cells obtained from blood collected from two to three weeks prior to the time the cells were used for this study. The recipient type of cells were used whenever possible, and the usual cross matching precautions were followed. In many cases, however, it was not possible to obtain the recipient type of cells, and "O" cells were used. All cells were carefully cross-matched for all major and minor agglutinins. No difficulty was experienced in administering the "sludged" red cells, that is, those from which the plasma had been carefully drained after the blood had been allowed to settle. We found that these cells, although appearing thick and viscous, would flow through a 20 gage needle without difficulty. An ordinary transfusion set was used, with a filter, tubing, and conventional needle, for the administration of the cells. No special apparatus or un-

usual precautions were utilized in the handling of the blood, except those normally used in handling blood from blood banks and for transfusions. Liver biopsies were done in all cases of cirrhosis. The response of all patients followed the same general course. Preliminary data on four patients are presented.

RESULTS WITH REPORT OF CASES

Cirrhosis of the Liver—It has been commonly observed that patients with liver cirrhosis, when hypoproteinemic, are also anemic, hence, it is odd that red cells have not previously been used in their treatment. There is little question that the red cells would benefit such patients. For this reason, our early studies were concerned with the use of the red cells in cirrhosis of the liver.

CASE 1 (fig 1)—A man with long-standing cirrhosis of the liver was admitted to the hospital. His weight was 233 lb (105.7 kg), and he had ascites as well as 4+ ankle edema. His liver and spleen were enlarged. He was placed upon a daily diet, constant in composition, consisting of 235 mg. of sodium, 111 gm of protein, 261 gm of carbohydrates, and 89 gm of fat. This represented a nitrogen intake of 17.7 gm per day and provided about 2,300 calories. This is of the order of basal plus 50% of the calories required for this patient's nutrition, and, while not a "high" caloric diet, it was all the food he would take. Furthermore, we felt that such a diet would not mask protein synthesis from the red cells by a possible rapid synthesis of protein from the oral nitrogen intake. On this regimen, which lasted 50 days, from early in February until April 9, the patient steadily lost weight, as shown in figure 1, however, his total serum protein level not only did not increase but actually declined. The hemoglobin level dropped steadily during this period, and the red blood cell count also decreased slightly. On April 9, blood in the form of packed red cells was administered. The patient received 19 transfusions of about 250 cc of packed red cells each during the next 50 days. Immediately on administration of the first red cells, the patient's hemoglobin level and red blood cell count increased, as would be expected, although the increase was irregular. At this time also his serum protein level began to increase steadily, until it reached a value of almost 7 gm per 100 cc. During the stated period, no sudden change occurred in the rate at which he lost weight. This weight loss was due largely to diuresis, as far as we could tell, however, the patient was losing tissue substance, since he was in negative nitrogen balance (fig 2). Thus, by April 18 or 19, his weight began to level off, although he continued to lose fluid. This we

Fig 2 (case 1)—Nitrogen balance in patient with hepatic cirrhosis during administration of packed red blood cells. (Other data for this patient are shown in figure 1)

interpreted to be the result of protein synthesis. From a study of figure 2, it may be seen that the patient was in a markedly positive nitrogen balance during the last part of the study period, beginning some time in late April. He continued to lose fluid from his tissues. By June 1, ascites had entirely disappeared. The patient's general clinical condition had improved tremendously. His appetite was better, his color was improved, he had much more energy, and he was more interested in being

active, although he was confined to a minimum of activity. Hepatic function studies showed constant though slow improvement.

CASE 2 (fig 3)—This patient also had a cirrhotic liver. We did not include the red blood cell count data in figure 3 because changes in these values closely paralleled changes in the hemoglobin level in the case of other patients. This patient also had a long, fairly constant course, until red cell administration was begun. He received 22 red blood cell transfusions over 50 days.

Fig 3 (case 2)—Course of a patient with hepatic cirrhosis before during and after administration of packed red cells.

Figure 3 shows clearly that as soon as the red cells were administered, a rapid increase in the hemoglobin level from 5.5 to 16.5 gm per 100 cc occurred. During this period the serum total protein level rose from 5.7 to 7.4 gm per 100 cc and then slightly declined. The albumin and globulin levels, which had been low, first underwent a slight increase. This was followed by a reversal, and by the time administration of the red blood cells was finished, there had been an increase in the globulin level to a point at which it exceeded the albumin level. During the period, about one month, immediately following the transfusions, an extremely rapid change in the albumin globulin ratio occurred. Two weeks after the administration of the blood, the albumin level began to rise, to a high of 4.5 gm per 100 cc, and the globulin level began to fall, to a low of 2.2 gm per 100 cc. The total serum protein level showed, however, a net loss, so that the actual level at that time was about 6.7 gm per 100 cc. During this period, the clinical course of the patient was one of continuing improvement. His bilirubin level decreased, his thymol turbidity decreased, and his general clinical state improved tremendously. There seems little doubt that the administration of the red cells contributed directly to the formation of protein and its correct redistribution. It is interesting to note that, immediately after the use of red cells was begun, the albumin globulin ratio was reversed but was corrected after use of red cells was stopped.

Heart Failure and Cirrhosis—The effect of the administration of packed red cells as protein in heart failure associated with cirrhosis is illustrated by the following case.

CASE 3 (fig 4)—A patient in severe heart failure with old, inactive, rheumatic mitral valvulitis was admitted to the hospital. She had mitral stenosis and insufficiency, a large indurated liver, and pronounced hypoproteinemia and anemia. In addition, she was four months pregnant. The cirrhosis was presumed to have a dietary and cardiac basis, since the patient's history of food ingestion was very poor. Besides the usual clinical control, consisting of bedrest, digitalization, low sodium diet, and careful measurement of the fluid balance, the patient received 17 transfusions of packed red cells over a period of 42 days. She had been receiving digitalis prior to entering the hospital, so we feel that digitalization contributed little toward clinical improvement. With the patient at bedrest, diuresis began shortly after administration of the first packed red cells. Her general condition steadily improved. It will be noted in figure 4 that the hemoglobin level and the red blood cell count responded directly to the transfusions, as would be expected. It should also

be noted that the serum total protein level steadily increased, although there were wide fluctuations in the value. These were presumed to be due to fluid shifts resulting from the heart failure, cirrhosis, and pregnancy. The patient, who was small, weighing about 104 lb (47.2 kg) (dry weight), received 4,250 cc of red blood cells. About five weeks after admission, she gave birth to a stillborn infant of about 5½ months gestation. She went through this episode without untoward complication, her cardiac status remaining constant during the delivery. The hemoglobin level and the red blood cell count continued to increase. The serum protein level during this period leveled off, but, shortly after the stillbirth, it began to increase. The total gain in serum protein during the time the patient received blood was 0.8 gm (from 5.2 to about 6 gm) per 100 cc. The liver decreased in size, although it was still enlarged somewhat. The patient was discharged from the hospital on May 1 greatly improved. Throughout our study there was no change in the patient's blood type, her blood grouping, or the agglutination phenomena, including the Rh factor. These studies were carefully made while she was in the hospital and periodically after she left.

Nephrotic Syndrome of Glomerulonephritis—The effect of the administration of packed red cells on the protein deficiency of the nephrotic syndrome of glomerulonephritis is illustrated by the following case.

CASE 4 (fig 5)—A patient in the early nephrotic phase of glomerulonephritis was admitted to the hospital. He had slight generalized edema as well as the classical urinary condition that would be expected. For two weeks, beginning April 6, after this, the total protein level of the patient decreased, and the serum albumin and globulin levels fluctuated some but were both low. In this patient, however, the hemoglobin level and the red blood cell count were not nearly so low as they were in the patients with hepatic cirrhosis. In other nephrotic patients studied, the same phenomena as well as the same type of response were observed as reported in this case.

In figure 5, it will be noted that when red blood cell administration was started a plethora immediately began to develop. During the administration of only five units, 250 cc each, of packed red cells, the patient's hemoglobin level went up to almost 19 gm per 100 cc. The red blood cell count rose well above 6 million. At the same time, there was a drop in the serum albumin level and a rise in the globulin level, resulting in a reversal of the serum protein ratio. After the administration of 1,250 cc of red cells, there was a rise in the total serum

Fig 4 (case 3)—Results of administration of packed red blood cells to a patient with mitral stenosis and insufficiency, chronic right heart failure, hypoproteinemia, normocytic anemia, hepatomegaly and probably hepatic cirrhosis with a dietary and cardiac basis.

protein level. The albumin level began to rise, and the globulin level dropped slightly, and, three weeks after red cell therapy had ended, the patient had about 5 gm of albumin and 2.5 gm of globulin per 100 cc. At the same time, there was a sharp fall in the hemoglobin level and red blood cell count. Similar phenomena were seen in two other patients with the nephrotic syndrome who were studied. In other patients there was such a large urinary loss of albumin, which increased after the red

cells were administered, that there was no net gain in the albumin in the blood. In these cases, however, all the evidence indicates that actually the patients were synthesizing albumin at an increased rate. In one patient the urinary loss rose from 8 to 50 gm per day following red cell transfusions. The patient described here readily lost his edema, his sense of well being returned, his color improved, and he finally left the hospital in good condition.

STUDY OF NITROGEN BALANCE

Figure 2 shows the results of nitrogen balance studies performed on the patient in case 1. It will be noted that during the 30 day period from April 9 to May 8 the patient was receiving nitrogen from his food and from administered red blood cells as indicated in figure 1, and that the intake of nitrogen was lower than the urinary excretion of nitrogen. No attempt was made to determine the fecal nitrogen level. During this period, there was a negative nitrogen balance, and the patient was losing a net amount of protein equivalent to 1.7 gm of nitrogen per day. During the 20 day period from May 9 to May 29, although the patient's nitrogen intake was

Fig 5 (case 4)—Course of a patient with the early nephrotic phase of glomerulonephritis before during and after administration of packed red cells.

almost identical to that of the previous period, he had a positive nitrogen balance of about 8 gm of nitrogen per day. This means that his urinary nitrogen excretion had fallen to much lower values than those of the previous period. This long period was adopted because it gives an over-all picture of what was taking place in the patient more effectively than would a shorter period. The nitrogen excretion was determined from three day specimens. During the period from May 9 to 29, the patient actually was storing about 50 gm of protein per day. Despite the fact that he did not gain weight, because of fluid loss, his muscles improved in tone and strength. His general condition improved tremendously, and at the end of this time the patient was discharged from the hospital, free from ascites but with a still palpable liver and spleen. Studies on other patients yielded similar results.

COMMENT

The enormous quantities of packed red cells given deserve comment. In case 1 (fig 1), the patient had a dry weight of 144 lb (65.3 kg). He had a calculated

blood volume of about 6,000 cc, and he received 4,750 cc of red cells. The patient in case 2 weighed 145 lb (65.8 kg) dry weight, and he, too, had about 6,000 cc of circulating blood. This patient was given 5,500 cc of packed red cells. The third patient was a small woman of 104 lb (47.2 kg) dry weight. She received 4,250 cc of packed red cells, despite the fact that her calculated blood volume was 4,000 cc. It is obvious that in these three patients these red cells could not have remained in the blood stream as circulating red cells. They must have disappeared from the circulation, and the assumption is made that they were broken down, since there is no apparent warehouse where these cells might be stored. There was no undue increase in the red blood cell counts or hemoglobin levels, except in the nephrotic patients. There was a gradual rise in the serum protein level, so that we are forced inescapably to the conclusion that there was a destruction of red cells, especially in the patients with hepatic cirrhosis. A plethora was produced in the patient in case 4 by introduction of a relatively small quantity of red cells, 1,250 cc. In this patient, who was nephrotic, apparently the red cells were not destroyed. There is no ready answer for this difference in the behavior in the two groups of patients. It has clinical substantiation in that frequently nephrotic patients have relatively normal red blood cell counts and hemoglobin levels, despite the hypoproteinemia in the presence of edema, but cirrhotic patients almost always have anemia as well as hypoproteinemia.

It might be argued that this effect of red cells may be considered nonspecific and that these responses were a result of an increase in the oxygen carrying capacity of the blood and improvement in the patient's general well-being. This cannot be denied, however, the administration of red cells seemed to have additional effects. First, there was a simultaneous response of the hemoglobin and serum protein levels. In no case did either the albumin or globulin level start to increase until the red cells were administered. Second, as soon as the red cells were administered, there was an increase in the globulin level, which occurred first. The explanation of this phenomenon is not apparent. Third, when the peaks of the hemoglobin level and red cell count were reached, there was a drop or leveling off in these values, with a continuing increase in the serum protein level, especially the albumin. Finally, a consideration of the nitrogen balance gave further evidence that the patients were utilizing the red cells as a source of protein. The patient in case 1, who had about 6,000 cc of blood, had an increase in the hemoglobin level from 8.7 to 15 gm per 100 cc, which represents a rise in total hemoglobin from about 520 to 900 gm. Thus, about 388 gm of hemoglobin appeared in this patient as the result of transfusions of red cells. During the time that the patient received 4,500 cc of red cells, he received about 1,300 gm of hemoglobin, which means that about 900 gm of hemoglobin disappeared from the circulating blood. Thus, there seems to be little question that there is a direct relationship between the administration of the packed red cells and the increase in the serum protein level. Some may argue that this does not prove that the cells themselves were used as a source of protein, and, indeed, the evidence does not entirely establish this. Administration of this

large number of red cells, with the large percentage of hemoglobin they carry, may spare the body the necessity of synthesizing hemoglobin. This would mean that all of the protein taken in the form of food could be utilized in the manufacture of serum protein. Against this argument is the fact that the more than 900 gm of hemoglobin that disappeared in the patient in case 1 during the time that he received these packed red cells must be accounted for. Thus, not only does there seem to be a direct relationship between the administration of the packed red cells and the increase in the serum protein level, but also there seems to be more than suggestive evidence that some of the hemoglobin was actually utilized for the synthesis of serum protein. Such a viewpoint immediately raises the question of whether, in patients with cirrhosis, anemia is the result of a tearing down of the red cells for the synthesis of serum protein in some manner. There certainly seems to be evidence that our patients, despite continuing liver disease, were able to synthesize both albumin and globulin and that, once their red blood cell count was up and the hemoglobin level was restored to normal, the serum protein level was easily maintained at its normal level. This does not mean that they were cured of their liver disease. Actually, all of the patients studied had a continuing cirrhotic process, and in two (whose data are not presented here) this was proved by biopsy. An alternative suggestion is that a red cell may be transformed into serum protein in some site other than in the liver. These questions must await further study. It should be noted that some of the patients who received large quantities of red cells had bone marrow depression, as shown by

bone marrow studies. Erythroid elements of the bone marrow were depressed following administration of large quantities of red cells. On the other hand, after the administration of red cells these patients were again able to synthesize their own red cells without difficulty, and their hemoglobin levels and red blood cell counts have been maintained at normal values.

In no case did we experience difficulty with the transfusions. As pointed out above, we encountered no transfusion reactions. So far as we could ascertain, there was no alteration in the agglutinins, the blood groups, or the blood types of the persons who received these red cells. We do not know at present whether the use of the aged red cells contributes in any way to their ease of destruction. Such destruction possibly may make the hemoglobin more readily available. Some type of liver injury may be necessary before this phenomenon of protein synthesis occurs. No evidence was obtained that any changes of the nature of hemosiderosis or hemochromatosis occurred in these patients. There were no color changes, and there was no evidence that there was any abnormality of the iron metabolism. The patient in case 1, after 18 months of follow-up, has no pigment changes and remains in good health.

CONCLUSION

Evidence is presented to show that packed red cells can be used as a source of protein in various types of hypoproteinemia. There is evidence that hemoglobin itself actually can be transformed into serum protein. No injury to patients receiving relatively large quantities of protein in the form of packed red cells was observed.

MENTAL RETARDATION IN CHILDREN

Abraham Levinson, M D

and

Charles Goldenberg, M D, Chicago

Mental retardation is one of the serious problems of childhood. According to the American Association on Mental Deficiency, quoted by Hungerford and associates,¹ 7% of the school population suffers from some type of mental retardation. Every mentally retarded child presents medical problems to a greater or lesser degree. In this paper we shall discuss some of the most important medical phases of the subject.

MATERIAL AND METHODS

Our data were obtained at the clinic for mentally retarded children of the Dr. Julian D. Levinson Research Foundation. In our series of 150 cases, there were 104 white children, 45 Negroes, and 1 Mexican. Table 1 illustrates the distribution of patients as to sex, race, and length of gestation.

The patients were investigated from the following standpoints. The time the retardation was first recognized, the length of gestation, the type of delivery, and the length of labor were determined. A history of the neonatal period was obtained, with special reference to complications, such as cyanosis, convulsions, respiratory

infections, hemorrhage, and fever of undetermined etiology. A history of the growth and development and of the diet and use of vitamin supplements was obtained. It was ascertained whether the child had sustained any trauma, with or without neurological manifestations, and whether he had had fever with convulsions, for possible evidence of encephalitis. The family was analyzed with reference to maternal illnesses before and during pregnancy, i.e., thyroid disturbance and Rh incompatibility, age of parents at birth of child, consanguinity of the parents, and familial neurological diseases manifested in other members of the family. The heating facilities of the home were determined, with reference to burning of batteries that might cause lead intoxication.

Physical examination included evaluation of the body build, height, and weight and measurement of the head and chest circumferences. Neurological examination was done to determine the presence of localizing signs. Psycho-

Owing to lack of space the bibliographic references have been omitted from THE JOURNAL and will appear only in the authors' reprints.

logical tests were given to establish the mental level of the child and his capabilities in a training program designed to meet his needs. Laboratory studies included x-ray examination of the skull, chest, long bones and wrists. A complete blood count was done, and urinalysis included a test for phenylpyruvic acid. An electroencephalogram was made, especially when convulsive disorders were present. Pneumoencephalography was done in selected instances.

RECOGNITION OF RETARDATION

One would think that the parents themselves would recognize the mental retardation of their child. Of 150 children, however, only 34 were found to be abnormal at birth, while in 31 other children, mental retardation was first suspected between 1 and 6 months of age. Thirty-five children were thought to be retarded at 7 to 12 months of age. In 25 children retardation was not noticed until 13 to 24 months of age. The remaining 25 children

SYMPTOMS AND TREATMENT

In addition to the mental retardation, there were often associated symptoms. The most important symptom was convulsions. A history of convulsions was present in 40 cases, in 34 of which the children had grand mal, in 4 petit mal, and in 2 combined seizures. Thus, 26.6% of the children with mental retardation had convulsions. Table 2 shows the distribution of convulsions according to etiology.

We used diphenylhydantoin (Dilantin) in cases of the grand mal type of seizure. The dosage was variable and was increased gradually until the desired effect was obtained. In general, it was not necessary to use more than 1½ grains (100 mg) of diphenylhydantoin three times a day. Hypertrophy of the gums was the only side-effect encountered, and usually it did not necessitate withdrawal of the drug. Others have made similar observations.³ Occasionally phenobarbital was used in conjunction with diphenylhydantoin. Trimethadione (Tridione) was employed to control petit mal seizures. Leukopenia was not encountered in periodic examinations of the blood.

We have made it a rule to treat convulsions with or without electroencephalographic changes for at least two years after subsidence of seizures. The question of anti-convulsant therapy for patients with abnormal electroencephalographic patterns but no clinical seizures has not been settled,⁴ however, we use anticonvulsants in such cases.

Speech difficulty was present in 127 cases, 58 of these children had no speech at all at 1 year of age or over, and 69 children had indistinct speech. It is no exaggeration to say that almost all mentally retarded children have some speech disturbance. Some of our patients responded to speech therapy and play therapy.

Hearing was absent in 16 cases. Huizing and Pollack⁵ have shown the importance of hearing in speech development in normal children and discuss the importance of early diagnosis of hearing defects. We want to point out how difficult it is to determine whether a mentally retarded child can hear. Audiometry is impossible to carry out in mentally retarded children because they do not concentrate. The handclap and tuning fork tests are uncertain. We have resorted to the electroencephalography test, in which it is determined whether there is any electroencephalographic response to noise. We feel that this is one of the best methods of determining the hearing ability of the mentally retarded child.

In four children there was no vision clinically, and at least four others had poor vision (table 2). Lack of concentration was present in all of our cases. We found pneumoencephalography of prognostic value. When the encephalogram shows definite cortical atrophy, the prognosis is usually very poor and the parents should be advised to institutionalize the child. When the pneumoencephalogram shows no cortical atrophy, it does not mean that the retardation is not severe but that treatment is at least worth while. Occasionally, the pneumoencephalogram may have a beneficial effect on the retardation, at least temporarily.⁶ This, we believe, can be explained either by a decrease of the intracranial pressure or possibly by tearing of the adhesions that may be present following arachnoiditis.

TABLE 1—Classification of Mental Retardation

Diagnosis	Full Term				Premature				Total
	Male		Female		Male		Female

were over 2 years of age before mental retardation was discovered, with 5 cases not suspected by the parents until after the children were 5 years of age. The latter cases were first recognized by the teacher. We have encountered cases where even the teacher did not recognize the retardation until the child had been attending school for two to three years.

With the exception of mongolism, which is evident at birth, the diagnosis of mental retardation is not always easy even for the physician. Even when convulsions and spasticity are present, the child may have a fairly good mentality. Gibson² has recently outlined the differential diagnosis of mental retardation. In our series, we had to differentiate from time to time between mental retardation and behavior problems, cerebral palsy without mental retardation, amyotonia congenita, myasthenia gravis, and difficulty in speech and hearing not due to mental retardation.

It is important for the physician to explain to the parents the type of disorder being treated and the objectives of the program to be instituted both medically and educationally. The latter can be accomplished with the help of the psychologist, speech therapist, and special teacher. If the retarded child is educable, the spheres of education must be found. Even if the child is not educable, he may be trainable.

TYPES OF MENTAL RETARDATION

One of the most difficult problems is classification of mental retardation. Gibson,⁷ Yannet,⁸ and others have classified their cases according to etiology. In some of our cases, more than one etiological factor was found. For instance, there may have been a history of prematurity, neonatal cyanosis, and a fall on the head during infancy. In such cases, it was hard to decide which was the primary and which was the secondary cause. In other cases, no cause could be found. Table 1 reviews the etiological classification of our cases in terms of the primary

We believe that the cases we speak of as being due to cerebral agenesis are the ones referred to in the literature as due to undifferentiated amentia or primary amentia.⁹ Some other cases, however, may be due to neonatal cerebral anoxia.

Age, sex, race, and age of parents seem to have no relation to the occurrence of cerebral agenesis. It is just a maldevelopment of that portion of the brain that is concerned with mentality. Unfortunately, we do not yet know what part of the brain is concerned with mentality.

Convulsions were present in 16 of the 48 cases classified as due to cerebral agenesis. Grand mal occurred in 14 of these children and petit mal in 2 of them. In most cases the interval between attacks was irregular. Each child had more than one seizure.

MONGOLISM

Of the 150 children with mental retardation, 36, or 24%, were mongoloid. Mongolism, which was first described by Langdon Down¹⁰ in 1866, presents no prob-

TABLE 2—Frequency of Certain Defects and Other Factors in 150 Cases of Mental Retardation

Diagnosis	Average Age Retardation Was Noticed	Major Convulsions	Minor Convulsions	Combined Convulsions	No Speech Over 1 Year	Indistinct Speech Over 1 Year	Absent Hearing	Questionable Hearing	Absent Vision	Poor Vision	Spontaneous Delivery	Breech Delivery	Instrument Delivery	Cesarean Delivery	Average Age of Mother	Average Age of Father	Consanguinity of Parents

* Following difficult deliveries.

cause of the deficiency. Table 2 illustrates the type of delivery, age of parents at the birth of the child, and incidence of consanguinity found in each etiological category. We shall discuss each type separately.

CEREBRAL AGENESIS

In 48 cases, or about one-third of the series, we were confronted with mental retardation for which no etiological factor could be found. The best we could do was to call it cerebral agenesis, or an under-developed brain. In some of these cases there was undoubtedly a genetic origin, but because no history of abnormality in the family was elicited, this factor could not be determined. These patients were mentally retarded but had no paralysis. Most of them were thin, but no physical abnormalities and no localizing neurological signs were noted. Since most of these children live a long time, there are few post-mortem reports. Years ago, one of our patients in whom we had diagnosed cerebral agenesis showed microgyria at autopsy.

lem in diagnosis. We were particularly interested in studying the various factors to which this disorder is ascribed, such as age of parents and consanguinity. For years the idea was prevalent in the literature that mongolism is most frequent in children of older parents born at the period of sexual exhaustion.

We found the average age of the mothers at the time of the birth of the mongoloid child to be 30 years. The chart gives a graphic representation of the distribution of the mothers' ages. Twenty-four mothers were over 30 years of age and 12 were under 30 years of age, the range being from 19 to 44 years of age. Benda¹¹ found 27% of the mothers in his series to be over 40 years old, while 41% were under 35 years of age. The average age of the father in our series was 31 years, with 12 being between 30 and 34 years old. Twenty-six of the fathers were over 30 years old and 10 were under 30 years of age. The range of the ages of the fathers was from 19 to 49 years, as

There were no instances of multiple mongoloid children in our series. Consanguinity did not occur among any of the parents. Twenty-eight of the mongoloid children were born spontaneously. One child was born by breech presentation with no complications. The remaining seven children were delivered by instruments. In only two instances were there complications at the time of the birth. One child was cyanotic for a few hours after delivery but the color improved with administration of oxygen, and the other child had delayed respiration, the exact time of the apnea being unknown.

Twenty-eight children were born at full term, and eight were prematurely born. Of the 28 children who were born at full term, 17 were boys (12 white and 5 Negro) and 11 girls (10 white and 1 Negro). Of the eight children born prematurely, five were boys (four white and one Negro) and three girls (one white and two Negro). Benda¹¹ found that 17.2% of his mongoloid children were prematurely born, and he believed prematurity to

Range of ages of parents at the birth of mongoloid children. The solid bar represents the fathers and the cross-hatched bar the mothers.

be an important factor in the etiology of mongolism. Our cases do not corroborate his theory. Mongolism was noted at birth in the great majority of cases or shortly thereafter.

It is commonly thought that mongoloid children have no convulsions. In our series, 2 of the 36 mongoloid children had convulsions of the major type. A generalized convulsion occurred in a 6-year-old white girl during a virus infection in which the temperature rose to 106 F rectally. There have been no recurrences. The second child was a white girl who had her first convulsion at 3 months of age. Seizures have been decreasing in frequency and severity and now occur about once every six months. In addition, this child has a congenital heart lesion diagnosed as an intraventricular septal defect. Our subsequent studies revealed several more mongoloid children with convulsions.

Fourteen mongoloid children over 1 year of age had no speech, while 18 had varying degrees of muffled or slurred speech. Four patients were under 1 year of age so the speech could not be studied.

Hearing was absent in four cases. One patient had severe myopia, which was corrected with glasses. Six mongoloid children were found to have a congenital heart lesion of the acyanotic type. Palmar horizontal lines were present in most of our cases, some bilaterally, others unilaterally.

Roentgenograms of the wrists were taken routinely and the bone age compared to the chronological age. In 10 instances there was a definite delay of development of the carpal ossification centers. In addition, six patients had carpal centers that were more translucent than normal, and the remaining children had normal ossification centers.

We believe that no one factor can be held responsible for the occurrence of mongolism. On the theory that mongolism represents a generalized infantilism, as shown by a decreased number of carpal ossification centers and underweight, we have been giving these patients thyroid extract. Along with this, an adequate diet with multiple vitamins is prescribed. Clinically, most patients showed an initial improvement in concentration and performance, but no definite conclusion can be drawn at this early stage of our study.

Durling and Benda¹² have pointed out that the spontaneous development of untreated and early institutionalized mongoloids was on an idiot level in 47% of their cases, however, with proper training many mongoloid children are educable. Several of our mongoloids are attending special schools or ungraded rooms of the public school. We feel that institutionalization should be avoided.

PREMATURITY

In our series of 150 cases of mental retardation, 28 patients, or approximately 18% of the total, were born prematurely. Eighteen of these 28 prematurely born children were found to have some etiological factor in addition to the prematurity to account for their mental retardation. For example eight were found to be mongoloid, four had had neonatal anoxia, two had microcephalus, two had hydrocephalus, one had hypothyroidism, and one had premature synostosis of the skull (table 1).

The remaining 10 children who had been premature were found to have no other etiological factor save the prematurity itself. The main problem is to distinguish prematurity with underdevelopment of the brain from prematurity complicated by other factors such as cerebral anoxia or hemorrhage. A careful, detailed inquiry into the birth and neonatal period may help make this distinction. Howard and Worrell¹³ found that prematurity per se had neither a beneficial nor a detrimental effect on later intelligence, however, our data indicate that prematurity may be an important factor in the development of mental retardation.

Interestingly enough, over 70% of these children who had no other etiological factors to account for the mental deficiency weighed 4 to 5 lb (1,814 to 2,268 gm), indicating that mental retardation is not in direct proportion to decreasing birth weight. The other three weighed between 3 and 4 lb (1,307 to 1,814 gm). Six cases, or 60% of the total, were the result of a normal spontaneous delivery. Of the remaining four patients, three were born by instrumental deliveries and one by cesarean section.

Only one patient in this series had convulsions. This was a 13-year-old Negro boy whose birth weight was 4 lb 12 oz. (2,155 gm). He had major and minor convulsions since 2 months of age at irregular intervals. Physical examination revealed no abnormalities. The electroencephalogram revealed a very abnormal record, with 2 to 3 per second spike activity.

MICROCEPHALY

Nine children, or 6% of the total of 150, had microcephaly. Four of the children were born by spontaneous delivery, one by a breech presentation, and four with instruments. Two of the children were cyanotic at birth. There were no other complications.

The average birth weight was 6½ lb (2,948 gm). Two white girls were premature. Among the seven full-term children with microcephaly, there were three white and 1 Negro boys, two white and 1 Negro girl.

The average age of the mother at birth of the child was 24 years and that of the father was 29 years. There was no history of consanguinity among any of the parents. The family histories were essentially noncontributory.

Convulsions were a predominant feature of microcephaly, occurring in seven of the nine cases. Six children had generalized convulsions, starting at an early age, while one patient had combined major and minor seizures. These children were severely retarded. Hearing was absent in two patients and very questionable in the others. Vision was impaired in four of these patients. There is no treatment for microcephaly.

POSTMENINGITIS RETARDATION

Among our cases there were eight patients who had become retarded following meningitis. Two children had recovered from tuberculous meningitis, one had hemophilus influenza meningitis, and one had pneumococcal meningitis. In the remaining four cases the bacteria were not discovered.

Four of the eight children had a history of convulsions. In three cases the convulsions occurred during the meningitis but did not recur. The fourth child, who had meningitis at the age of 4 months, has continued to have grand mal convulsions about every six weeks since the onset. Speech was totally absent in three patients over 1 year of age and in two others the speech was very indistinct and slurred. The remaining three children were under 1 year of age. Hearing was absent in two patients and questionable in one. One patient with tuberculous meningitis who received streptomycin therapy retained her hearing. In the other child who had had tuberculous meningitis, the hearing was questionable. Vision was intact in all of the cases.

It was pointed out by one of us (A. L.)¹⁴ that frequently meningitis is complicated by secondary encephalitis, which is particularly true in tuberculous meningitis. These children show a change in their personality, usually becoming restless and hyperactive, and many have sporadic convulsions. Sedative and anticonvulsive therapy is particularly indicated. Future evaluation of the wide spectrum antibiotics in the postinfection management of these conditions is being studied.

POSTENCEPHALITIS RETARDATION

Encephalitis without meningitis was responsible for eight of our cases of mental retardation. There was 1 white boy, 1 Negro boy, 5 white girls, and 1 Negro girl in this group. All of these children were born at full term, with the average weight of 7 lb 5 oz (3,317 gm). All of the children were born spontaneously, with no birth traumas or complications.

Four children had convulsions during the encephalitis, and the convulsions have continued to occur intermittently. Two children had grand mal and two had petit mal seizures. It is interesting to note that the younger children in our series had petit mal seizures.

Three children who were over 1 year of age were unable to say the simplest words, while four other children had indistinct speech. One child was under 1 year of age, and speech, therefore, could not be properly evaluated. Hearing was intact in six cases, and in two instances the ability to hear was doubtful. Vision was intact in all children. Horizontal nystagmus was present in one child, facial paresis in two other children, and hemiplegia in three children.

We are currently administering large doses of aureomycin to postencephalitic patients following the preliminary report of Stamps and co-workers.¹⁵ They found patients with postencephalitis disorders who showed improvement clinically and electroencephalographically. Anticonvulsant medication was continued during the antibiotic therapy. Serial electroencephalograms are required to evaluate this latest therapy, and a larger series of patients should be assessed statistically.

HYPOTHYROIDISM

Hypothyroidism, we believe, is responsible for more cases of mental retardation than is credited to it, since the hypothyroidism may be subclinical. Although innate cerebral retardation may coexist with hypothyroidism, thyroid therapy is still worthy of an adequate trial.

Hypothyroidism, we think, was responsible for eight of our cases of mental retardation. Our diagnosis of hypothyroidism was based on physical features with the help of basal metabolic determinations in one case and delayed ossification centers in two cases. Although delayed bone age is not limited to hypothyroidism, we consider it of great importance in cases of mental retardation where there is no explanation for the delayed bone growth other than hypothyroidism. This is particularly significant when the child has a cretinoid facies. We agree with Reilly¹⁶ that clinical observations are as important as laboratory tests in detecting this deficiency.

There were 3 white boys, 1 Negro boy, 2 white girls and 1 Negro girl, all of whom were born at full term. One white girl was born prematurely. The average birth weight of the group was 6 lb 8 oz (2,948 gm). Four children were delivered spontaneously, three were delivered by instruments, and 1 was born by cesarean section. Three of the eight children were cyanotic at birth and required oxygen.

The average age of the mother was 28 years and the average age of the father was 30 years at the birth of the child. Consanguinity was present in the case of a white boy in whom cretinism had been diagnosed at 11 months of age. At 14 months of age, we found only one ossifica-

tion center in the wrist on roentgenologic examination in this child. Speech was absent in four children who were over 1 year of age. The remaining four children had indistinct and slurred speech. The average age the mental retardation was noted was 1½ years.

One of the eight patients with subclinical hypothyroidism has shown considerable improvement with thyroid therapy, three have had some improvement, and four have remained about the same as before treatment. The possibility of innate cerebral lagging independent of the hypothyroidism as being responsible for the discrepancy between mental development and early adequate and prolonged thyroid therapy has been pointed out.¹⁷ Other investigators, however, believe good mental development can be achieved.¹⁸ Our patients are still being treated with thyroid extract and will be critically evaluated after a long-term study.

NEONATAL ANOXIA OR HEMORRHAGE

There were seven children who presented a definite history of neonatal anoxia and/or cerebral hemorrhage at the time of birth or shortly thereafter. We felt that their mental retardation was the result of this neonatal episode.

Four of these patients were prematurely born and were also the result of difficult forceps delivery. There was one set of twins in this group, each weighing approximately 4 lb (1,814 gm) at birth. At 3½ years of age, the twins, white girls, could not sit or walk alone and had no intelligible speech. They both had a left internal strabismus, were underweight, and had hyperactive deep tendon reflexes. The third prematurely born patient was also a white girl weighing 4 lb 8 oz (2,041 gm) at birth. She required oxygen and blood transfusions at birth because of her poor condition. At 12 years of age, she had a right foot drop, was ataxic, and walked on a wide base. She was able to say a few words indistinctly. The fourth prematurely born child, who had neonatal anoxia, was a Negro boy who weighed 4 lb 15 oz (2,240 gm) at birth. At 6 years of age he was found to be hyperactive with fair speech. He was very much of a behavior problem in addition to being mentally retarded.

The remaining three children in this group were born at full term but had traumatic births. One was a white girl who, at 2½ years of age, was so retarded that institutionalization was advised. This child became cyanotic six hours after birth and had a generalized convulsion at that time. The convulsions recurred at two weeks and eight weeks of life. She was unable to sit, stand, walk or talk, and was markedly underweight.

NUTRITIONAL DEFICIENCY

The relation of mental retardation to deficient nutrition is another problem with which we were confronted. In our series of 150 cases, we found 4 children who could be classified as having mental retardation secondary to nutritional deficiency. That nutrition can affect mental growth and development was illustrated recently by Traebert¹⁹ in Germany. We found that the apparent mental defect in our four patients was in great measure reversible after proper correction of the malnutrition, avitaminosis, and anemia. One child has returned almost to normal status, and the remaining three patients have improved considerably.

The first patient was a 16-month-old Mexican boy who had been treated for one month for persistent intermittent diarrhea. *Endamoeba histolytica* was found in the stools, and the patient improved with antiamebic drugs. At 16 months of age, however, he was poorly nourished, anemic, and unable to turn over. His muscular tone was poor. The infant also appeared listless and apathetic and looked mentally retarded. He was given iron and multiple vitamins, including vitamin B₁₂. An adequate diet was given. When seen two months later, he had gained 5 lb (2,268 gm), was sitting alone, was beginning to walk, and appeared alert. During subsequent visits he had continued to improve mentally almost to normal.

The second child was a Negro girl, 14 months old. She had a history of pneumonia at 6 months of age and frequent upper respiratory infections since that time. She could only turn over, but could not sit or walk. Speech was absent. It was felt that nutritional inadequacy played a role in the child's retardation. Her diet was improved and vitamin supplements added. The child improved although she is still subnormal mentally and physically.

The third and fourth patients of this group were both Negro boys, aged 6 months and 2 years respectively. Clinically, these children appeared to have rickets with scurvy. Both children were weak and anemic. Progress has been made by these children, although the rate of improvement has been slow. This raises the real possibility of reversible changes of the central nervous system resulting from prolonged malnutrition.

HYDROCEPHALUS

Hydrocephalus was present in four cases of mental retardation. Two patients were born spontaneously, while two others were delivered by cesarean section. One of the latter was also premature, weighing 4 lb 7 oz (1,913 gm) at birth. All four children were found to be underweight for their ages.

One infant, a 3½-month-old white girl, had a sacral meningocele. This had been operated on soon after birth and progressive enlargement of the head followed. The infant was spastic in all four extremities. Another infant, a 6-month-old Negro girl, was studied thoroughly; a subdural tap revealed no abnormality. The cause for progressive hydrocephalus, however, could not be found. In a similar fashion, the basic cause of the hydrocephalus could not be ascertained in the remaining two patients, a 4-year-old white girl and a 3-year-old white boy. All four children were found to be markedly retarded for their ages.

Hydrocephalic children, we believe, should be given every chance to prevent further thinning of the brain. We favor the ventriculocisternostomy of Torkildsen²⁰ for reestablishing circulation and absorption of the cerebrospinal fluid. Unfortunately, in these patients the hydrocephalus, when seen by us, was already too far advanced to warrant such a procedure.

CEREBRAL TRAUMA

Accidental trauma to the head, we believe, was responsible for mental retardation in two patients. The first child, when seen by us, was 16 years old. He was a white boy who apparently developed normally until the age of 3 years. At that time he fell one story out of an

open window, and convulsions developed one month later. Since then he had failed to progress mentally and was unable to speak well. Pneumoencephalography revealed an excess of air over the cortex, indicating cortical atrophy.

The second patient was a 19-month-old Negro boy who was hit on the head by a door at 3 months of age. At the time of the injury, he was unconscious for five minutes. He became cyanotic shortly thereafter, and had a generalized convulsion, which had not recurred. At 19 months of age he was still unable to sit without support, had no speech, and was markedly retarded.

MISCELLANEOUS

The remaining six patients with mental retardation included one born following toxemia of pregnancy, one with myasthenia gravis, one with the hypothalamic syndrome, one with hemangiomatosis (Sturge-Weber disease), one with hypopituitarism, and one with premature synostosis of the skull.

The patient in whom we considered toxemia of pregnancy as the etiological factor was a Negro girl, 5 years old. The mother had hypertension and was acutely ill at the time of delivery. The child weighed 7 lb 13 oz (3,542 gm) at birth. Development of the child was slow, and at 4½ years of age she had her first generalized convulsion. The convulsions have been irregular in frequency since then. Physically, the child was found to be within normal limits.

The case of myasthenia gravis, with mental retardation, is included here because of the difficulty it presented in the diagnosis. This case will be reported elsewhere in greater detail.

The diagnosis of hypothalamic syndrome was made for a 5-year-old white boy who was found to have a buffalo type of fat distribution and was very obese. His neonatal history was noncontributory. At 3 months of age polydipsia and polyuria developed. At 7 months of age he had his first convulsion. At 2½ years of age he began to gain weight very rapidly. His intelligent quotient was found to be 41.

Hemangiomatosis (Sturge-Weber syndrome) was diagnosed in a 5-year-old white boy who was born with large port-wine areas of the right side of the face and neck. A black mole was present on the right forehead. At 3 months of age he began to have about 10 to 15 generalized convulsions daily. At 2 years of age his seizures were predominantly right-sided. Calcifications of the brain were seen in roentgenograms of the skull. A cerebral arteriogram revealed dilatation of the vessels. He was markedly retarded.

Hypopituitarism was diagnosed in a 10-year-old white boy. Clinically, he resembled a person with Cushing's syndrome, with prominent adiposity of the face, neck, and trunk. He was 56 in (140 cm) tall and weighed 123 lb (55.9 kg). Severe myopia was present. Horizontal nystagmus was found on lateral gaze. His speech was indistinct, but the hearing was intact. X-ray examination of the skull revealed no abnormality. The intelligent quotient was 40. His parents were first cousins.

Premature synostosis of the skull was found in a 6-month-old Negro girl. Her head measured 14¾ in (36.87 cm) and her chest measured 16½ in (41.25 cm). The fontanelles were closed. The infant was unable

to hold up her head, and it was doubtful whether she could see or hear. The extremities were spastic and the deep tendon reflexes were hyperactive. She was admitted to the children's division of the Cook County Hospital for further study. It was hoped to give the brain a chance for maximal growth by surgically separating the bones of the skull at the suture lines. Accordingly, surgery was done at the age of 7 months. At 1 year of age the infant was reevaluated and, unfortunately, no improvement had occurred. The head now measured 15 in (37.5 cm) and the chest 18 in (45 cm), and the infant presented a strikingly small head. She could not support her head and did not see or hear, the extremities were rigid. Our patient was subjected to surgery since this measure seemed to be the only hope for her, however, the final result was not satisfactory.

SUMMARY

One hundred and fifty cases of mental retardation in children have been studied. In only 65 cases was the retardation discovered at 6 months of age or earlier. In some cases the retardation was not recognized until the child started to school. Convulsions were found in 26.6% of our cases, of which 85% were grand mal, 10% petit mal, and 5% combined seizures. Convulsions were particularly frequent in microcephaly. Grand mal and petit mal convulsions were usually controlled with diphenylhydantoin (Dilantin) and trimethadione (Tridione) respectively. Electroencephalography is an important adjunct not only in determining the type of convulsive disorder but also in determining the patient's ability to hear. The age of the parents at birth of the child and consanguinity could not be interpreted as primary factors in the etiology of any type of mental retardation. We found thyroid extract of value in subclinical hypothyroidism. We have also used thyroid extract in the treatment of mongolism. We have used wide spectrum antibiotics in the treatment of mental retardation following encephalitis. Improvement of nutrition is an important part of the therapy of mental retardation. Cooperation between physicians, psychologists, speech therapists, and special teachers is needed for the management of mental retardation.

30 N Michigan Ave (Dr Levinson)

The Headache of Brain Tumor.—Tumors occur more frequently on the brain than on any other organ of the body, and patients themselves are beginning to realize this. Therefore, when a patient complains of headache, the physician's greatest concern may be whether or not he has a tumor of the brain. More often than not we must learn what we can from his story and on the basis of it, decide how much further to proceed with examinations that may involve surgical procedures. If the patient says that the headache began in recent weeks or months, that it is becoming worse, that it recurs in the same situation, that it often awakens him early in the morning, that it is accentuated or even brought on by coughing, stooping, straining or shaking the head, then an organic intracranial lesion is suspected. If precipitate vomiting, especially before breakfast, is associated, and if the pulse, when felt carefully and continuously for two or three minutes, becomes slow or irregular at times, then the condition may be critical and in all probability caused by a tumor.—H. W. Wolman, M.D., *What the Patient's Story Suggests to the Neurologist*, *The Journal of the Iowa State Medical Society*, May, 1953.

DIRECT MEDICAL SERVICE PLAN IN THE HOTEL INDUSTRY

Frank P. Guidotti, M D , New York

Comparatively few persons in the medical profession other than those actively engaged in the practice of industrial medicine are aware of the extent to which organized workers are covered by health and welfare plans today. Information on this subject is not restricted, but neither is it widely disseminated. Since the end of the war, establishment of such plans has been a top objective in collective bargaining of most of the industrial unions in the country. As an indication of the scope of such employee benefit plans, the U. S. Department of Labor reported in mid-1950, in its Bulletin No. 1017, that 7,128,000 workers were covered by health and welfare plans. About two-thirds of these plans also embody pension plans. These workers are represented by the Congress of Industrial Organizations, the American Federation of Labor, and unaffiliated unions, and they comprised almost half the organized workers in the country at that time. In the two and one-half years since the middle of 1950, the labor force has grown, the number of organized workers has grown, and the unions' drive for "security programs" has been accelerated by the wage stabilization program that limited income gains. The majority of these plans are financed by the employer, although a substantial portion represent joint employer and employee financing. Collectively bargained employee health and welfare plans now cover a substantial portion of the labor force in our country today. They are an important new phase in the field of medicine and health, and they seem to be here to stay.

THE NEW YORK PLAN

To give you an example of how they are operated, I would like to tell you about the health-welfare plan with which I am associated. I do not presume to say that it is typical of the majority of those in operation, but it is a good example of how a well-administered program of this sort operates. The hotel industry of New York City became the first in the country to establish an industry-wide group insurance program for hotel employees on March 1, 1945. This program, known as the New York Hotel Trades Council and Hotel Association Insurance Fund, was created through the joint action of the New York Hotel Trades Council (affiliated with the American Federation of Labor), representing labor, and the Hotel Association of New York City, representing management.

During the first seven years of the plan's operation, \$7,298,000 in welfare benefits was received by hotel workers and their families among 35,000 eligible hotel employees insured by the plan. These benefits include life insurance, accidental death and dismemberment insurance, weekly accident and sickness benefits, cost of Health Center care, and hospital benefits for members and dependents through the Associated Hospital Service

(Blue Cross) of New York. Recently, in addition to the welfare benefits already listed, a pension fund was established, which will provide retirement benefits for hotel employees.

Having established this part of a social welfare program and desirous of making certain that all hotel employees would have available to them a medical care program as a supplement to and part of an over-all picture, the New York Hotel Trades Council and the Hotel Association of New York City in 1949 decided to establish their own jointly operated and controlled Health Center. The New York State Legislature passed a special act in April, 1949, authorizing a membership, non-stock corporation in the name of the New York Hotel Trades Council and Hotel Association Health Center, Inc., "to establish and maintain a health center to furnish any or all of the following: medical care, surgical care, medical advice and treatment, medicine and apparatus, and other health services to ambulatory patients, all through duly licensed physicians, or in the case of optical examinations, through duly licensed optometrists. The corporation shall furnish such care, treatment, services and supplies to employees covered by collective bargaining agreements between the New York Hotel Trades Council (a labor organization affiliated with the American Federation of Labor), the Hotel Association of New York City, Inc. (a membership corporation composed of hotels in the city of New York), and such hotels, either gratuitously or for a compensation determined reference to the value thereof. Such health center shall not be established and maintained in the State of New York without the prior written approval of the State Board of Social Welfare as to the adequacy of the facilities and standards of care of the health center, including adequacy of personnel, and such health center when established shall be subject to the supervision, visitation and inspection of the State Board of Social Welfare."

The site chosen for the Health Center was a five story building situated in mid-Manhattan at 50th St. and 10th Ave., formerly occupied by the Young Women's Christian Association. It was renovated into a modern attractive structure and outfitted with up-to-date equipment for diagnosis and treatment. The amount expended for purchase of the building, architectural changes, renovations, and equipment was \$800,000. In the autumn of 1950, written approval was given by the New York State Board of Social Welfare for the establishment and maintenance of the Health Center.

The medical staff at the Health Center is composed of well recognized members of the profession. The directors and chiefs of clinics are all certified by their respective boards and colleges. The junior members of the staff are, for the most part, similarly qualified. Our efforts to have on service for the benefit of the hotel employees only professional men in good standing in the county, state, and national societies has been successfully accomplished. Rather than put our medical services on a production-line basis, in which the individual person

Read before the 13th Annual Congress on Industrial Health Chicago Jan. 20, 1953

Medical Director, New York Hotel Trades Council & Hotel Association Health Center, Inc. Assistant Clinical Professor of Industrial Medicine, New York University Post-Graduate Medical School

becomes only a number, we are working toward a doctor-patient relationship comparable to the highest ideals of private practice

Many employees in this industry are so situated financially that obtainment of the services of a private physician for them is out of the question. In addition, the amount of time necessary for their admission to and treatment in a charitable clinic is almost prohibitive, because if they do not work they are not paid. At the center all patients, except in cases of emergency, are treated on an appointment basis. Hence, loss of time is reduced to a minimum. Our hope is ultimately to arrange matters to such an extent that if an employee has an appointment at the Health Center for necessary treatment he will suffer no financial loss. Every effort is made to convince each patient that his problem is our problem, and no effort is spared to make him feel and be better mentally as well as physically. The spiritual element of friendliness is a fundamental concept of the Health Center.

ELIGIBILITY REQUIREMENTS

All unionized hotel workers are eligible for outpatient services at the Health Center as of the first day of employment. In cases in which hospital care is necessary, workers are required to have six consecutive months in good standing as members of the New York Hotel Trades Council and four months of full-time employment in a union-contract hotel or concession that is a contributing member of the insurance fund. Members of employees' families are not eligible for care at the Health Center unless they are also qualified hotel workers.

ORGANIZATION AND ADMINISTRATION

A Board of Directors consisting of 20 members, 10 from the New York Hotel Trades Council and 10 from the Hotel Association of New York City, have full authority to control all the affairs and business of the corporation. A Medical Advisory Council, composed of 15 outstanding physicians well known in such allied fields as industrial medicine, public health, and industrial hygiene, was organized for the purpose of establishing standards and rules and regulations relating to professional and technical services for the Health Center, reviewing physicians' qualifications, recommending appointment of physicians to the staff, and hearing and judging disputes between the corporation and a patient or physician with respect to professional and technical matters and making appropriate recommendations to the Board of Directors.

A Medical Board composed of the 14 directors and chiefs of the various medical services in the Health Center has the function of supervising the conduct of the professional staff operating the clinics with regard to problems presented in the usual course of events of the Health Center. The Medical Director of the Health Center has the following main functions: (1) direction and supervision of the medical and professional services of the Health Center, (2) serves as an ex-officio member of the Board of Directors, to whom he gives quarterly reports on Health Center services, as a member of the Medical Advisory Council, and as Secretary of the Medical Board, (3) coordination of the entire Health Center organization together with the Administrative Director.

The Administrative Director, Mr. W. H. Spahn, in addition to duties as director of the insurance fund, supervises the lay staff of 35 persons, is responsible for purchasing, accounting, statistics, and maintenance, and is an ex-officio member of the Board of Directors and the Medical Advisory Council.

PHYSICIAN REQUIREMENTS FOR HEALTH CENTER APPOINTMENT

Applications from physicians interested in a position on the Health Center staff are received by the Medical Director for review. An appointment is made for a personal interview. The application, together with interview blank, is then referred to the Director of Medicine or the Director of Surgery for review of the applicant's record of training and experience. The application with the director's comments is then passed on to the chairman of the Committee on Professional Standards of the Medical Advisory Council, for review by his committee. Final approval is given by the Medical Advisory Council.

The general qualifications are as follows: 1. The applicant must be a graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association at the time of his graduation. 2. He must have completed an internship of at least one year in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association or its equivalent in military service. 3. He must be licensed to practice in the State of New York. 4. He must be registered with the Education Department of the State of New York. 5. He must be a member in good standing of his county medical society. 6. He is required to carry a minimum of \$25,000/\$75,000 malpractice insurance. 7. He must furnish proof of good moral character.

The specific qualifications are as follows: A general medical physician must have a staff appointment in the inpatient or outpatient department of a voluntary or municipal hospital approved by the Joint Commission on Accreditation of Hospitals (which consists of representatives from the American College of Physicians, American College of Surgeons, American Hospital Association, American Medical Association, and Canadian Medical Association). A specialist must be certified by the American board in his respective specialty, or he must have an appointment as attending or associate attending physician in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association for resident training in that specialty.

OPERATION OF THE PLAN

The medical staff of the Health Center is comprised of 175 physicians, of whom 30 are general practitioners and 145 are specialists. Fifteen general practitioners, averaging nine hours each per week, and 75 specialists, averaging three hours each per week, participate in active clinic assignments. The medical-technical staff consists of 13 registered nurses, 4 laboratory technicians, 3 x-ray technicians, 2 physiotherapists, 2 pharmacists, 2 registered medical record librarians, 1 optometrist, and 1 registered medical social service worker.

The Health Center began to provide medical care on Oct. 25, 1950, for 35,000 hotel workers, ranging in age

from 18 to 85, who are employed in 180 New York City hotels and 52 concessions. Two-thirds of the hotel employees are male, and the median age is 47. The 10 local unions that comprise the New York Hotel Trades Coun-

cil cover the various occupational groups in the hotel industry, numbering over 200 and representing the gamut of hotel employment.

At the Health Center, the following medical services, in addition to diagnostic and therapeutic care, are pro-

vided: preplacement examinations, periodic examinations, physical examination to employees on return to work after illness or injury, and rehabilitation and health education for employees, including a nutritional program. Adequate medical records, industrial health research, analysis of health experience, coordination with community health programs, and collaboration with union and management all contribute to a healthful and safe working environment.

A complete physical examination at the Health Center is conducted by a well-trained general practitioner, whose concern is health as well as disease, and is supplemented by a 70 mm roentgenogram, urinalysis, and blood tests. The details of the examination are recorded, and definite action is planned, including follow-up and periodic rechecking of the patient. Any abnormalities requiring special attention are referred to staff specialists in the Health Center. Each general medical session is under the supervision of an internist, who acts as a consultant for his session. The number of patients served in each specialty clinic for the years ending Dec 31, 1951, and Dec 31, 1952, is shown in the following tabulation.

	1951	1952
Ophthalmology	2,656	2,248

Cardiology	279	323

Table 3 shows the diagnoses established for the year ending Dec 31, 1952. A total of 20,980 diagnoses were made (an average of 1.89 diagnoses per patient).

In line with the Health Center program of preventive medicine, a regular health information program is maintained for members of unions that have contracts with the hotels. This takes the form of articles and pictorial features on Health Center activities appearing regularly in the "Hotel and Club Voice," the weekly newspaper of the Hotel and Club Employees Union, Local 6. This paper is mailed to the homes of 27,000 of the 35,000 hotel workers eligible for the center's services. Other locals of the Hotel Trades Council send out pamphlets to their employees. Thus, not only the hotel members but their families as well receive the Health Center's message. Information is also released through the monthly newsletter, "This Month," of the Hotel Association of New York City and through the publications of the New York Hotel Trades Council, and pamphlets are distributed at the Health Center and insurance fund office on such subjects as prenatal care, heart disease, overweight and underweight, diabetes, tuberculosis, and blood bank services.

In addition to the medical services rendered in the Health Center, we have given the following services outside the center: in-hospital care, free ambulance service, visiting nurse service, and blood bank services. From Oct 26, 1950, to Nov 1, 1952, there were 1,306 hospi-

tal admissions, of which 914 were surgical, 382 were medical, and 10 were maternity, with an average stay of 9.9 days

There are, however, certain exclusions to Health Center care. They are as follows: (1) occupational diseases and injuries covered by workmen's compensation

or similar legislation, (2) service-connected disabilities in cases of veterans who are entitled to care through government facilities, such as the Veterans Administration, (3) conditions requiring highly specialized treatment or confinement to special institutions. Among these are acute alcoholism, addiction to drugs, treatment of tuberculosis when a sanatorium or special hospital is required, mental or nervous disorders that demand long-term care, and chronic diseases that must be treated in specialized institutions, (4) home care, with the exception of emergency calls to determine need for hospitalization, (5) deep x-ray therapy for malignant lesions, (6) special or private duty nursing care, and (7) surgery or electrolysis for cosmetic reasons

HEALTH CENTER AS A SUPPLEMENTARY INSTITUTION

The services at the Health Center are offered to the hotel employees in an effort to help them reestablish their health and encourage them to further individual effort for improvement of their personal circumstances, socially, ethically, and financially. All costs are met by the employer. If an employee has a private physician, the center cooperates with him in every possible way by furnishing his patient with diagnostic and special services, including laboratory and roentgenographic procedures. All reports of our examinations are, on request, forwarded to the referring physician, and, if additional information is requested, every endeavor is made to comply with the request. A sincere effort is made to

cooperate with physicians in private practice to maintain the principle of proper patient-doctor relationship. We supplement existing community services by cooperating with all hospitals and departments of health and welfare of the city as well as private social agencies.

CHOICE OF PHYSICIAN

No sick hotel employee is compelled to visit the Health Center. In order that the proper patient-physician relationship may be established, any person must be permitted a free choice of physician. Every effort is made at our Health Center to provide such an opportunity. If for any reason a patient becomes dissatisfied with the assigned physician at the time of his first visit or subsequent visits, he has only to indicate that such is the case, and another physician is assigned to determine whether the situation can be improved. No effort is made to urge professional services, medical or surgical, on a patient. It is recognized that for successful outcome of a medical problem as much depends on the patient's attitude toward and confidence in the physician as on the dispensing of a pill or the use of the scalpel.

FINANCIAL ASPECTS

Medical service at the Health Center is provided without charge to eligible patients, except for prescriptions filled in the Health Center pharmacy. Staff physicians are paid on an hourly basis at the Health Center. In cases in which hospital medical or surgical treatment is authorized by the Health Center, the physician is reimbursed by the Health Center in accordance with a fee schedule equivalent to the Blue Shield Plan (United Medical Service of New York City). Each patient hospitalized has Blue Cross coverage through the insurance fund. As stated earlier, the funds for the entire welfare program are provided by employer contributions, which consist of 3% of the weekly payroll of each contributing member hotel and concession and which are allocated for the insurance fund.

CONCLUSIONS

In August, 1952, in recognition of the medical standards of the Health Center, this organization was certified by the American Foundation of Occupational Health and the Industrial Medical Association. This industrial

health program benefits both the employer and the employee. The advantages to employees include reduction of occupational illness by early discovery of diseases, less absenteeism for illness, and an improvement in the worker's personal health, which contributes to greater satisfaction in life. The employer minimizes his labor turnover, has maximum job production by less absenteeism, and maintains better union-management relations.

The wheel has been accepted as a fundamental example of progress, its component parts recognized for their individual contribution to the entity. Through the cooperative efforts of management, labor, and the medical profession, problems will be solved rather than created. These powers form the spokes of the wheel of industrial health achievement.

501 W 50th St (19)

EFFECT OF STREPTOMYCIN IN SYNOVIAL TUBERCULOSIS OF THE KNEE

William S. Smith, M.D.

and

Robert W. Bailey, M.D., Ann Arbor, Mich.

Bony ankylosis has long been the desired end-result in tuberculosis of a joint. It is generally believed that the pathological process has the best opportunity of becoming and remaining arrested when ankylosis occurs. Joint motion, on the other hand, is precarious with regard to progression and relapse. Therefore, one must assume that any drug therapy must eventuate in complete eradication of the infection unless osseous ankylosis is still to be considered as the desired end-result.

Drug therapy and its limitations in chronic infection of bone alone are becoming more clearly recognized. The presence of decreased local vascularity, massive fibrosis, necrosis, sequestrums, and other encapsulated foci would lead one to expect poor results in drug therapy. These conditions result in failure to obtain satisfactory local levels at the source of the infection. When critically analyzed, little evidence exists to warrant any conclusions that such therapy is beneficial in cases of long-standing osseous tuberculosis. On the other hand, in synovial tuberculosis local vascular conditions would seem to favor increased local availability of the drug.

Streptomycin has been shown to exert a definite bacteriostatic effect on tubercle bacilli in vivo under certain conditions. For this reason and in view of the circumstances listed, the means of obviating ankylosis and simultaneously arresting infection are at least within the realm of possibility. Bickel and co-workers¹ have reported beneficial effects in two cases of synovial tuberculosis proved by biopsy. These cases were followed 6 and 18 months, respectively. Two cases of synovial tuberculosis treated by streptomycin plus synovectomy were described by Smith and Yu.² Streeten^{3a} obtained

beneficial effects with local alkalinization and streptomycin therapy, but the follow-up period is of insufficient duration to warrant conclusions. Recently Bosworth,³ Harris,⁴ and others summarized their results in large numbers of persons with bone and joint tuberculosis.

Owing to the fact that tuberculous synovitis is a manifestation of a generalized disorder, all but one of the five patients in this report were under sanitarium care. In the fifth case, complicated by pregnancy, the home situation was considered ideal for treatment. All cases were proved by cultures for tubercle bacilli and by animal inoculation of aspirated joint fluid. The dose of streptomycin varied between 1 and 2 gm. per day administered parenterally for a total of 90 to 120 days. The roentgenograms demonstrated no osseous involvement prior to treatment. All patients were immobilized in plaster for several months to a year. In the more recent cases *p*-aminosalicylic acid was used as an adjunct in streptomycin therapy, since its effect in preventing resistance of tubercle bacilli to streptomycin seems well founded. The daily dose varied between 9 and 12 gm. of sodium and potassium *p*-aminosalicylic acid given orally.

REPORT OF CASES

CASE 1—In September, 1945, a 33-year-old man with known pulmonary and urogenital tuberculosis was referred to the Orthopedic Section with a complaint of atraumatic swelling of the left knee. Guinea pig inoculation of fluid aspirated from this joint resulted in recovery of tubercle bacilli. The erythrocyte sedimentation rate was 55 mm. per minute. A definite program of treatment was outlined, but the patient refused these recommendations and signed a release from the sanitarium against his physician's advice.

Because of pulmonary and central nervous symptoms in October, 1946, he had returned to a sanitarium and then was referred to the University Hospital for reevaluation. About one year had elapsed since his previous examination. The knee was still boggy, there was slight flexion deformity, and atrophy of both thigh and calf was marked. Roentgenograms at this time, as in 1945, showed rather diffuse osteoporosis about the left knee, but there was no evidence of osseocartilaginous destruction. Further studies confirmed the presence of active minimal pulmonary tuberculosis and active right renal tuberculosis. The renal tuberculosis was treated by nephrectomy, from which the patient made an uneventful recovery. The synovial tuberculosis was combated with continuous immobilization, with removal of the plaster at three month intervals for x-ray examinations, none of which revealed true bone involvement. Sanitarium care was resumed after hospital discharge.

One year later, in 1947, symptoms and signs of meningeal irritation made their appearance and analysis of the cerebrospinal fluid confirmed the clinical diagnosis of tuberculous meningitis. Intrathecal and parenteral administration of streptomycin were combined, 0.2 gm daily for 36 days in the former case and 1 gm daily for 137 days in the latter. The patient made a complete recovery from the meningitis but unfortunately carries residual permanent eighth nerve deafness as a result of streptomycin toxicity. Immobilization of the knee was continued for another year.

For the past five years he has been on a program of full knee activity without any difficulty. There has been no pain with unrestricted activity, the erythrocyte sedimentation rate has remained normal, and there has been complete disappearance of osteoporosis on the roentgenograms. Clinically there is no residual periarticular thickening and no evidence of redundant synovium or effusion. Full extension is present actively and passively, but flexion remains limited to 90 degrees. There is no residual thigh or calf atrophy. There was fine retropatellar crepitation present for the past three years, probably on the basis of chondromalacia of the patella.

CASE 2—In November, 1948, a 5 year-old boy was admitted to a nearby hospital for "lung congestion" following measles. The intracutaneous tuberculin test was positive, and chest roentgenograms revealed a juvenile pulmonary tuberculosis involving the left upper lobe and left hilar lymph nodes. Search for tubercle bacilli in sputum and gastric washings was negative. At the parents' insistence the child was released after a short period of hospitalization and in general felt well except for occasions of slight fever.

A sudden atraumatic onset of effusion of the left knee made its appearance in August, 1948, and was closely followed by pain and stiffness of the knee. In November, 1948, when consultation was sought at the University Hospital, examination of the left knee revealed a typical boggy effusion with limitation of the extremes of flexion and extension of the knee. Fluid aspirated from the left knee produced tubercle bacilli on culture. Chest roentgenograms demonstrated left hilar lymphadenopathy and extensive tuberculous involvement of the left upper lobe unassociated with cavitation.

Immobilization of the left knee was started immediately after aspiration in November, 1948. When the presence of tubercle bacilli was demonstrated, streptomycin therapy was instituted. A total of 60 gm of streptomycin was given parenterally during the next 30 days in divided daily doses. For the next 82 days 1 gm of dihydrostreptomycin was administered parenterally every 12 hours. After completion of this course of therapy sanitarium care was instituted, and the program consisted of rest and immobilization. Repeat roentgenograms of the knee at three month intervals exhibited osteoporosis, but there was never any evidence of osseocartilaginous erosion. During this time the patient improved generally, with increase in weight, arrest of the pulmonary tuberculosis, and return to normal of the elevated erythrocyte sedimentation rate.

In August, 1950 on his return for orthopedic evaluation, there was no evidence of effusion and periarticular thickening was minimal. Quadriceps atrophy was moderate. Since ankylosis has been the aim of treatment in tuberculous joint involvement, arthrotomy was performed. The joint exhibited no visible abnormality. The synovium was not hyperemic, and there was no evidence of pannus formation. The articular cartilage was smooth and glistening; there was no erosion or fibrillation. Because of the implications of drug therapy in this case, a search for subchondral tubercle formation was carried out. No such foci were found. After subchondral investigation had been made, no other alternative than arthrodesis was left. This operative procedure was performed with great care to avoid damage to the epiphyseal cartilage. Histopathological examination revealed no evidence of tuberculous osseocartilaginous damage or tuberculous synovial reaction. Tissue cultures for specific organisms were negative.

CASE 3—In September, 1945 this woman, then 21 years old, was admitted to the Michigan State Tuberculosis Sanitarium with moderately far advanced reinfection of pulmonary tuberculosis. It was recognized at that time that she had definite tuberculous involvement of the third and fourth lumbar vertebrae, and shortly after institution of sanitarium care she was

placed on a Stryker frame. In November, 1946, a large pelvic abscess was punctured, and posterior colpotomy was productive of 300 cc of purulent material from which tubercle bacilli were cultured. She recovered slowly from the gynecologic procedure and was returned to the sanitarium, where she remained until April, 1948. During this time she remained on a Stryker frame and received general care.

Beginning in April, 1948, the patient noticed swelling of the right knee. Material aspirated from the knee revealed tubercle bacilli on both culture as well as animal inoculation. Streptomycin, 0.5 gm intramuscularly, was given twice daily for three months. It is interesting to note that at the time of the onset of the lesion of the knee, the status of the pulmonary tuberculosis was considered much improved, as was the destructive process in the lumbar vertebrae. The erythrocyte sedimentation rate was normal. In May, 1948, a spinal fusion was performed for the tuberculosis of the vertebrae with an uneventful postoperative course. Immobilization of the right knee was continued for approximately one year. X-ray examinations given every three months failed to disclose evidence of osseous abnormality. In June, 1949, the patient was again studied at the University Hospital. The roentgenograms were again considered normal except for marked diffuse osteoporosis, and it was believed, in view of the excellent response to the streptomycin immobilization program, that knee exercise could cautiously be initiated and weight bearing started. Since that time her course with regard to the synovitis in the right knee has been one of progressive improvement.

In November, 1952, she had no symptoms referable to the chest, back, knee, or pelvis. She had been walking without support, with unrestricted activity, for about two years, and exhibited a full, complete range of active and passive motion. There was approximately $\frac{1}{2}$ in atrophy of the thigh with $\frac{1}{2}$ in atrophy of the right calf. There was no effusion, capsular thickening, or retropatellar crepitation. There was no increased heat or redness about the joint. X-ray examination again failed to reveal any evidence of osseous abnormality, and the osteoporosis previously ascribed to disuse had disappeared. Various roentgenologists have interpreted the present films as entirely normal. The erythrocyte sedimentation rate remains normal.

CASE 4—A 26 year-old student from India complained of a tender swelling along the right side of his neck in February, 1949. There was a history of occasional fever and headaches; there were no pulmonary symptoms. A firm, fixed, 5 by 5 cm supraclavicular mass was excised for diagnostic purposes. Grossly this was an enlarged lymph node from which, on both guinea pig inoculation as well as on culture, *Mycobacterium tuberculosis hominis* were demonstrable. A sinus tract from this operative wound subsequently developed and continued to discharge tubercle bacilli. In June, 1949, the patient noted a mass over the right anterior chest wall superficially located just lateral to the sternum in the region of the second costochondral junction. This mass was 4 cm in diameter and had a boggy consistency. Diagnostic aspiration revealed tubercle bacilli. In addition a swelling in the region of the left pisiform at the flexor carpi ulnaris insertion was found, and from this area tubercle bacilli were recovered. Sanitarium care was instituted, the wrist was immobilized, and he was given dihydrostreptomycin and *p*-aminosalicylic acid (sodium) parenterally. Dihydrostreptomycin was administered in 0.5 gm doses daily for 120 days.

Within four and one half months of treatment the chest and neck sinuses healed. There was never any specific evidence of involvement of the pisiform by a tuberculous process, and it was concluded that the lesion in this area had affected primarily the tendon sheath. After eight months he left the sanitarium against medical advice.

Three weeks later, January, 1951, the patient reappeared at the University Hospital with complaints of pain, swelling, and limitation of motion in the right knee, which had been present for three days. (It is interesting to note that the joint roentgenographic surveys made in June, 1949, revealed no evidence of involvement of either knee.) Similarly x-ray examination of the right knee at this time failed to demonstrate any osseous abnormality. Typical cultures of *Myco tuberculosis* were

grown from material aspirated from the knee. The extremity was immobilized in plaster, and the man immediately returned to the sanitarium, where he remained until June, 1951. Streptomycin therapy was reinstituted to complete a course of 2 gm daily for a 60 day period. Also, administration of *p* aminosalicylic acid was resumed, as was the general program of bed rest. After four months, immobilization was discontinued, activity of the knee joint was begun, and there was no evidence of effusion or of periarticular thickening. Roentgenograms revealed only the osteoporosis secondary to disuse. Recheck roentgenograms taken 26 months after the appearance of the effusion demonstrated no osteoporosis or erosion. Clinically there is still limitation of flexion at 70 degrees but extension is full. There is approximately $\frac{1}{2}$ in thigh atrophy. There is some periarticular thickening. The sedimentation rate is normal. The patient has gained weight and has no complaints. The other areas of tuberculous involvement mentioned have remained arrested. At examination the left wrist at the present time is normal. The man has had a full college schedule for the past year and a half and is active in intramural athletics.

CASE 5—A 24-year-old white housewife complained of the spontaneous atraumatic start of pain and swelling of the left knee in November, 1949. After a month of increasing symptoms, diagnostic aspiration of the knee was carried out. Tubercle bacilli were recovered from the fluid on culture as well as animal inoculation. Complete system symptom review as well as roentgenograms of the chest and knee and the sedimentation rate were normal. Intracutaneous tuberculin tests in various dilutions to 1:1,000 were positive. Repeat sputum analyses and gastric washings did not disclose tubercle bacilli. The leg was immobilized in plaster, and, because the facilities were ideal, she was returned home on a program of bed rest and dihydrostreptomycin, 1 gm intramuscularly daily, plus 9 gm of *p* aminosalicylic acid (sodium) orally.

On completion of a 90 day streptomycin-*p* aminosalicylic regimen, she returned to the hospital. Clinically the knee revealed no evidence of effusion but there was minimal synovial thickening. Because of the course exhibited by the cases previously presented, it was believed immobilization could be discontinued. She was started on a program of active knee exercise and graduated weight bearing on the left lower ex-

tremity. Roentgenograms of both chest and knee revealed no abnormalities apart from the osteoporosis.

At present, three years since institution of treatment, she is carrying on full activity as a housewife, limited in the last 10 degrees of flexion, but other than this clinical and x-ray examination show a normal knee.

SUMMARY AND CONCLUSIONS

Five cases of synovial tuberculosis of the knee proved by demonstration of tubercle bacilli from aspirated joint fluid are presented. All patients were treated with streptomycin and have been followed from nearly three to six years. On a theoretical basis, the local vascular conditions in synovial tuberculosis are favorable for the effective use of streptomycin. Streptomycin exerts a definite beneficial effect on the course of synovial tuberculosis of the knee. In none of these cases presented was osseocartilaginous tuberculosis observed before treatment. Of great significance is the fact that none of the patients have shown x-ray evidence of osseocartilaginous erosion since institution of therapy. In one case in which arthrotomy was performed one year after streptomycin administration there was no gross pathological, bacteriological, or histological evidence of tuberculosis in the synovium, cartilage, or subchondral bone. The implication is that streptomycin may eventuate in obliteration of tuberculous infection within the synovium. Whether this is complete remains to be seen in longer follow-up studies. If eradication is incomplete, it remains further to be seen whether the minute trauma of activity resulting from continued motion will eventuate in exacerbation. Also, the question of exacerbation of the synovial tuberculosis or the perpetuation of the infection through incomplete antimicrobial therapy remains to be answered by observing this as well as similar series for several years.

SIGNIFICANCE OF GRAND MAL SEIZURES DEVELOPING IN PATIENTS OVER THIRTY-FIVE YEARS OF AGE

Louis Berlin, M.D., Mt. Vernon, N.Y.

Convulsions appearing for the first time late in life may presage the appearance of the more obvious manifestations of progressive brain damage by tumors, vascular disease, or degenerative diseases. It has therefore become current teaching that, when seizures develop in adulthood, they are usually expressions of some serious underlying disease with grave prognostic implications.¹ This has led to a justifiable attitude that the appearance of seizures warrants a careful search to detect the structural lesion responsible for the seizures. The frequent failure to discover the etiological agent, however, leaves the physician with a disquieting uncertainty as to whether there still remains some destructive process that his diagnostic methods have failed to uncover.

Owing to lack of space the bibliographic references have been omitted from THE JOURNAL and will be included only in the author's reprints.

Read at the meeting of the New York Neurological Society and Section of Neurology and Psychiatry of New York Academy of Medicine Nov 10 1952.

From the Neurological Section, Bronx Veterans Administration Hospital, Bronx, N.Y., and the Department of Medicine (Neurology), Cornell University Medical College.

The basic studies for the work-up of patients who develop seizures usually consist of a complete neurological examination, spinal tap, x-ray examination of the skull, and electroencephalogram, in addition to the procedures to determine the general physical status. It is relatively simple to decide on additional diagnostic procedures and to estimate the prognosis when the grand mal seizures are associated with abnormalities in the neurological status or general condition. There are adults, however, who manifest no neurological dysfunction other than grand mal seizures and whose simple laboratory studies fail to reveal the cause of the seizures. They pose the question of what structural lesions are responsible for their seizures and whether more than the simple diagnostic procedures are indicated in the investigation of the cause of the seizures. In order to evaluate the diagnostic and prognostic implications of the late onset of seizures and to assess the need for special diagnostic procedures in the absence of other findings, it was decided to review the records of 125 ambulatory men

whose grand mal seizures appeared for the first time at or after 35 years of age. Twelve patients had associated psychomotor seizures.

The age of onset of seizures ranged from 35 to 67 years, and the seizures had been recurring for from 6 months to 29 years (table 1). It is to be observed that

TABLE 1—Years Elapsed After Onset of Seizures Without Neurological Abnormalities

66 out of 125, or 53%, were observed for four or more years after the onset without the progressive development of signs of focal neurological damage. In three patients reversible focal neurological signs did develop during the course of their illness, but these signs were probably unrelated to the process that caused the seizures. In one patient, whose seizures started at the age of 40, hemiparesis followed apoplexy 14 years later, when he was 54. Another patient had transient hemiparesis following a head injury at the age of 52, three years after the onset of seizures. In a third patient facial palsy developed following a head injury at the age of 55, 18 years after the onset of the seizures.

Pneumoencephalography is often advocated as part of the examination of a patient with the late onset of seizures in the effort to detect a brain tumor. Fifty-four patients had pneumoencephalograms, three had ventriculograms, and one had an arteriogram from 6 months to 15 years after the onset of seizures (table 2). There were four clearly abnormal pneumoencephalograms. One patient had a cyst in the region of the body of the right lateral ventricle and another had a diffusely dilated ventricular system, both apparently resulting from severe closed head injuries sustained over 10 years before the pneumoencephalogram was made. Neither patient showed any disturbance of function other than seizures. One patient, who had been having severe uncontrolled seizures for 10 years, had a widely dilated ventricular system. That was the only patient with both impaired mental function and pneumoencephalographic abnormalities. In the three ventriculograms made, the only abnormality, a dilated lateral ventricle, was found in the patient in whom the left hemiparesis developed at the age of 54, 14 years after the onset of seizures. The one arteriogram was normal. Hence in patients with normal neurological status, normal spinal fluid, and normal results of x-ray examination of the skull, not one tumor was detected by encephalography.

It is well known that a normal pneumoencephalogram does not preclude the presence of a tumor. Twenty-nine cases of brain tumors with normal encephalograms and/or arteriograms have been reported.⁸ In this group, there were 15 patients with seizures. Fourteen out of the 15 patients with seizures had had Jacksonian seizures alone or in combination with grand mal seizures. They also

had some other clinical, spinal fluid, or x-ray indication of a destructive lesion of the brain. Only one patient had grand mal seizures without other evidence of focal abnormality, and in that patient aphasia and hemiparesis developed 10 months after the onset of seizures.

It has been repeatedly asserted that tumors are the commonest cause of seizures in this age group.^{1a} It has been estimated that from 29 to 45% of patients with brain tumors have seizures,³ and about 15% have seizures as their initial symptom.⁴ In one series⁵ of 316 cases of brain tumor, of 68 patients with seizures, only 13 had seizures for more than one year without other signs of brain tumor. It is not clear how many had had Jacksonian seizures.

It is not enough to know that seizures occur in brain tumors, instead the type of seizure and the constellation of associated symptoms and findings that would constitute the criteria for the diagnostic consideration of and intensive search for a brain tumor should be defined when the presenting complaint is that of seizures. Therefore in an effort to clarify the relationship of the seizures to brain tumor, I reviewed my own series of 81 supratentorial primary and metastatic tumors, 2 abscesses and 1 tuberculoma, all confirmed at operation or autopsy. In these cases, 39 patients or 46% had seizures prior to operation. Twenty-three, or 59% of patients with seizures, had Jacksonian seizures (with or without grand mal attacks), which indicated a focal lesion. Nevertheless, three patients with focal seizures had normal pneumoencephalograms, one, one, and four years, respectively, after the onset of seizures, and one had a normal ventriculogram and arteriogram one year after onset. All four had frontal gliomas. In the presence of a parietal astrocytoma that had caused grand mal seizures for three years and Jacksonian seizures for three months, one arteriogram disclosed no abnormality.

TABLE 2—Number of Years After Onset of Seizures That Pneumoencephalograms or Ventriculograms Were Made

		2*	1*			1*	1*	

* The results of the tests were abnormal in these cases.

† The V indicates that a ventriculogram was made. All other figures indicate the number of pneumoencephalograms.

In this entire series, six patients (7%) had been having grand mal seizures from two to six years without demonstrating additional neurological abnormalities. There were three temporal and two parieto-occipital astrocytomas and one sphenoid ridge meningioma. Four patients had had normal pneumoencephalograms within two years after the onset of the seizures. Although some of these patients with grand mal seizures had electro-

encephalograms indicative of a focal abnormality, this alone could not serve as an indication for surgical intervention in the absence of any other findings but might be an additional warning that careful observation was required

On the basis of these observations it appears that over 85% of patients with seizures due to brain tumors will have either Jacksonian seizures or other evidence of tumor within one year after the onset of the seizures. Furthermore, although a small number of slow-growing brain tumors may cause grand mal seizures for several years before producing any other abnormalities, it seems highly unlikely that pneumoencephalography, ventriculography, or arteriography will reveal the tumor at that early stage in development when all other clinical signs, study of spinal fluid, and x-ray examination of the skull

TABLE 3—Interval Between Onset of Seizures and Psychological Tests

reveal no abnormalities. From this it appears that only the presence of Jacksonian seizures and progressive neurological deficit substantiated by abnormalities of the spinal fluid and skull roentgenograms justify the intensive search for a brain tumor as part of the investigation of the seizures.

Because of the inference that the onset of grand mal seizures in adult life may also mark the development of some degenerative process, the mental status of these patients was evaluated. A total of 58 patients had a battery of psychological tests consisting of a Wechsler-Bellevue test, Rohrschach test, Bender-Gestalt test, Goldstein-Scheerer form sorting test, and a diagnostic memory scale (table 3). Of this group only five patients showed a significant degree of impaired mental function indicative of structural brain disease, but in no patient was it severe enough to require indefinite hospitalization. In addition, there were four other patients who gave evidence of intellectual impairment as demonstrated by defects of memory, calculations, and abstraction

during the course of the clinical mental status examination. It is of some interest that two of those with mental disturbances were having seizures at least once a week, but the mental status improved as the seizures were brought under control. Hence only 9 patients of 125 may be considered to have manifested some deterioration in their mental status.

All these patients had at least one spinal fluid examination. The only abnormality consisted of increased protein, ranging from 63 to 123 mg per 100 cc in 12 patients. The highest value occurred in one patient who died in status epilepticus without any significant abnormality being found at postmortem examination. The other abnormalities found were also associated with hypertension and minute traumatic softening of the brain.

Electroencephalograms were made for 109 patients. Thirty-five per cent had dysrhythmic records, but this did not materially aid in ascertaining the cause or management of the seizures. This is in accord with other observations⁶ that the late onset of seizures is associated with a low incidence of electroencephalographic abnormalities.

Among the most significant factors contributing to the production of the seizures were closed head injuries, alcoholism, and hypertensive cardiovascular disease. Fourteen patients had had severe closed head injuries without gross sequelae other than epilepsy (table 4). The interval between the time of the injury and the onset of seizures ranged from a few months to 20 years. In this whole group, 20 patients indulged in alcohol in excess prior to development of their seizures. Twelve patients had hypertension and/or coronary artery disease. In 40 patients severe closed head injuries, alcoholism, hypertension, and coronary artery disease, alone or in various combinations, preceded the onset of seizures. If these are factors contributing to the production of seizures, then there still remains a minimum of 84 patients, or 67%, in whom no chronic systemic or neurological disease was discernible as a cause of the seizures.

Five patients died from 2 to 15 years after the onset of the seizures. One patient died at age 50, in status epilepticus, 15 years after onset of the seizures. The brain showed no gross or microscopic lesions other than fresh ventricular needle tracts. Another patient died at age 53 of rheumatic heart disease, 15 years after the onset of seizures. The only abnormality consisted of a cribriform state of the basal ganglions. One death eight years after onset of seizures was attributable to metastatic carcinoma of the thyroid, but the brain showed only multiple small traumatic softening on the surface of the frontal lobes. Another patient died two years after the onset of seizures, of a reticulum cell sarcoma. One year prior to death, results of examination of his spinal fluid, psychological tests, and a pneumoencephalogram had been normal. Shortly before his death, there were 12 "lymphocytes" in the spinal fluid. The brain showed no gross abnormalities, but in the meninges there was a thin layer of large round cells resembling reticulum cell sarcoma that was thought to be of recent origin. In one case in which death was attributable to hypertension and coronary artery disease, there was no examination of the brain.

COMMENT

It has been implied that one of the most important diagnostic considerations in the late onset of grand mal seizures is that of brain tumor, however, only 5% of intracerebral tumors persist for more than one year with grand mal seizures as the only clinical abnormality. Less than 20% of patients with seizures of all types resulting from brain tumors go more than one year without manifesting other clinical signs of tumors. It is recognized that patients with slow-growing brain tumors may have grand mal seizures for many years with no other abnormalities, but in these instances contrast air studies also fail to reveal any abnormality. In such cases vigilant follow-up is necessary to detect the unfolding of further signs of brain tumor.

In evaluating the factors that contribute to the development of grand mal epilepsy under the conditions set here, it was found that 33% of the patients had associated alcoholism, hypertensive cardiovascular disease, and/or severe closed head injuries. Even if to this group is added 15% of patients who have grand mal seizures due to brain tumors without other findings, there still remains over 50% of patients who have no demonstrable cause for the seizures. This coincides with the data of Lennox⁷ who, in a series of 1,676 male patients with "physiologic" epilepsy and 528 with "organic" epilepsy, found 125 cases of "physiologic" epilepsy and 55 cases of "organic" epilepsy with the onset after 35 years of age. It therefore appears that there exists a group of patients who begin to have seizures late in life without any apparent cause. These persons show no abnormalities of the mental, neurological, spinal fluid, or x-ray examinations of the skull. Pneumoencephalographic and ventriculographic studies fail to shed any additional light on a structural lesion under these circumstances. The prognosis for sustained good functioning in these persons is excellent.

Even if the contributing factors of alcoholism, head injury, and hypertensive cardiovascular disease are considered in this group of patients, the favorable prognostic implications of grand mal seizures in the absence of other clinical, spinal fluid, or roentgenographic abnormalities are apparent. Only 9 out of 125 patients showed some degree of intellectual impairment, and out of 66 patients followed for 4 or more years, none had neurological focal signs and only 3 showed evidence of mental difficulties. The current teaching that seizures developing late in life are indicative of some destructive process should be challenged. Although each patient with grand mal convulsions should be carefully investigated to determine the cause of the seizures, when examination of the spinal fluid, x-ray examination of the skull, and the clinical examinations reveal no abnormalities, air studies also fail to reveal any tumor. All these patients should be carefully followed to determine any new findings. A few patients in the group will ultimately reveal the presence of a brain tumor, but when these are excluded it should be recognized that a large proportion of the patients in whom grand mal seizures developed late in life show no destructive process and have a long course without cerebral deterioration. Recognition of this group will

spare these patients the problems of morbid prognostications and excessive or premature investigation by neurosurgical procedures.

SUMMARY AND CONCLUSIONS

The records of 125 ambulatory men who had had grand mal seizures starting at or after 35 years of age were reviewed. The seizures had been recurring for from 6 months to 29 years. These patients had no significant abnormalities in their neurological status, spinal fluid, or roentgenograms of their skull at the onset of the seizures. Fifty-three per cent were observed four or more years after the onset of the seizures without showing evidence of progressive degeneration or destructive lesion of the brain. Only 5 out of 58 patients given psychological tests showed evidence of structural brain disease on these tests. Four other patients showed similar disturbances during the clinical mental status examinations.

Hypertension, severe closed head injuries, and alcoholism contributed to the development of seizures in 32.5% of these patients. No brain tumors were detected in this group, although 53 pneumoencephalograms and 3 ventriculograms were made. They revealed only four atrophic lesions resulting from head injuries, intractable seizures, and one cerebral thrombosis that occurred 14 years after the onset of seizures.

About 85% of patients who have had seizures due to brain tumors have had either Jacksonian seizures or other indications of a focal lesion within one year after onset of the seizures. Less than 10% of brain tumors will cause grand mal seizures for more than one year without abnormalities in the clinical, spinal fluid, or skull roentgenographic examinations. At that stage in the development of a brain tumor when grand mal seizures are the only indication of a tumor, it seems unlikely that the present diagnostic procedures of pneumoencephalography, ventriculography, and arteriography will reveal the tumor. These patients will have to be carefully followed to detect any change in their findings before a space-occupying lesion can be detected. Although patients in whom grand mal seizures develop late in life should be carefully investigated and followed to determine the basis of the seizures, it should be recognized that in at least 50% of patients who have grand mal seizures without other abnormal findings, no destructive lesion of the brain will develop, and they will have a long course without cerebral deterioration.

Intra-Arterial Transfusion—Experimental data. encouraged us to use intra arterial transfusion clinically for patients in severe shock, and we have now done so on more than 120 occasions at the Kingston General Hospital. The cases included examples of exsanguinating operative and obstetric emergencies, gross traumatic shock in accident victims, severe burns, acute cardiac arrest, and operative shock, e g, that associated with pneumonectomy. In addition, more recently, 2 patients with coronary thrombosis in severe hypotension and shock have been given intra arterial transfusions. Our experience thus far has been entirely satisfactory, indeed, I am prepared to state categorically that intra arterial transfusion is far superior to intravenous transfusion, both in the treatment of established shock and as a preventive measure in operations in which serious and sudden shock may occur—D L C Bingham, M B., Ch B., Shock, *Journal of the International College of Surgeons*, November, 1952.

SELECTION OF A SCREENING PROCEDURE FOR DETECTING OCCULT BLOOD IN FECES

Albert I. Mendeloff, M.D., St. Louis

There have been numerous reports comparing the reliability and sensitivity of the various tests used to detect occult blood in the feces, but there has been relatively little agreement as to which of the tests—guaiac, benzidine, or orthotolidine—has the requisite sensitivity and specificity that would make it the desirable screening procedure for routine use.¹ This lack of agreement is in large part due to the lack of experimental data designed to answer the following question: What is the greatest quantity of blood lost into the upper gastrointestinal tract, either at a single hemorrhage or at a constant daily rate, which would consistently escape detection by these commonly employed tests, even if every stool passed were examined?

The problem of detecting blood lost into the lower colon is not so pressing, since the gross appearance of the stool and the relatively greater concentration of blood per gram of feces make even the least sensitive of these tests adequate for accurate screening. A reliable answer to the question formulated above has an important bearing on several phases of medical theory and practice, such as the early detection of upper gastrointestinal malignancy or the theoretical aspects of the pathogenesis of hypochromic anemia. It would seem that the only reason for doing determinations of occult blood in the feces is to be able to state that there has or has not been bleeding of a certain magnitude into the intestine. It is therefore necessary that a test with well-defined sensitivity be

employed. Furthermore, it is essential that the procedure of the test not require elaborate preparation of the patient and that the reagents employed show as little deterioration and variation as possible during routine use. As screening tests, such procedures should be standardized under conditions prevailing in the physician's office, or in the average hospital clinical laboratory, rather than by highly-trained technicians using the facilities of a research laboratory.

This report attempts to answer the above question, employing the gum guaiac test and the modified Gregersen benzidine test. Since the effect of ingested iron preparations on the specificity of the guaiac reaction (but not of benzidine tests) has long been controversial, the experiments have been so designed that the control group ingested iron salts in addition to an unrestricted diet.

PROCEDURE

For the past three years, second year students at Washington University School of Medicine, during their course in laboratory diagnosis, have cooperated in two types of experiment. All tests were carried out by the students under the supervision of their instructors.

1. One-half of the subjects in each group, while on unrestricted diets, has received various quantities of human blood instilled through gastric tubes or swallowed. The other half of each group has taken an unrestricted diet plus ferrous sulfate or ferrous gluconate in various commercial preparations, at a dosage level providing 180 mg of reduced iron daily, beginning with the first day of stool collection. From the time of ingestion of either blood or iron salts, all stools were saved for the following 64 to 72 hours, with appropriate notation as to gross appearance and time at which defecation occurred. Representative samples of each stool were analyzed by each of the following techniques.

Guaiac Test—A small piece of feces is spread out on filter paper, and two drops each of glacial acetic acid, 95% ethanol solution of gum guaiac, and 3% hydrogen peroxide are added in that order. The color is read at five minutes and is graded as a 0 to 4+ reaction.

Benzidine Test (Gregersen Modification)—A mixture of 0.025 gm of benzidine base and 0.20 gm of barium peroxide, as dry powders, is dissolved in 5 ml of 50% acetic acid. A small piece of feces is spread on a white filter paper, and two drops of the reagent are mixed with it. The result is read at 15 to 30 seconds and graded as a 0 to 4+ reaction. The reaction occasionally may fade rapidly after 30 seconds, turning brown. If benzidine dihydrochloride (0.025 gm) is substituted for the benzidine base, the color produced is much more stable and thus easier to read.

2. Eleven normal subjects ingested daily 15 m³ packed red cells (equivalent to at least 30 ml of h¹ for periods of four to six days. Every stool passed collected and analyzed by each subject with both tests as described.

J., Shapiro, N., and Goodman, S. Observations on Oral Administration of Citrated Blood in Man. II. Effects on Stools. *Am. J. M. Sc.* 203:409 (March) 1942.

In addition to these two experiments, a third investigation was carried out, in order to compare the Gregersen test using benzidine base against a similar test employing benzidine dihydrochloride. Eighty-one stools from unselected patients hospitalized on the medical and surgical wards were examined by these two tests as well as by the guaiac procedure, all tests being performed by a technician in the routine hospital laboratory under my supervision.

RESULTS

The essential experimental data are recorded in tables 1, 2, and 3, and are self-explanatory. These experimental subjects had no disturbances in bowel function, and from table 1 it may be seen that the average number of stools per subject was similar in the blood-fed and iron-fed groups. Most of the negative tests in the group ingesting blood were due to the fact that the first stool passed had little opportunity for contact with the ingested blood,

homogenization of the stool sample and boiling to destroy peroxidases, was employed. Since the studies of others² have shown conclusively that blood ingested in quantities greater than 100 ml will almost invariably result in strongly positive reactions to both tests, this study has been focused upon the effects of small amounts of "blood loss," namely 25 to 50 ml.

It is apparent from table 1 that a significant number of persons with "blood loss" in the stomach of 50 ml on a single occasion will not be identified if every subsequent stool passed over a 72-hour period is examined by the guaiac technique. These findings are somewhat at variance with reports in the literature, although Peranio and Bruger recently placed the lower limit of detectable loss at 20 ml by this technique.^{1a} With a "blood loss" of 25 ml, a much higher percentage of the stools was negative to the guaiac test. It may, therefore, be stated that the critical level of blood loss for the guaiac test's sensitivity

from table 2 it would appear that it may take several days for complete admixture of administered blood with the stool. About 67% of the negative benzidine reactions and 45% of the negative guaiac reactions occurred with the first stool passed, this obviously affects seriously the over-all percentages of negative reactions. It was felt, however, that table 2 would serve to clarify this matter more adequately than would arbitrary exclusion of the first stool passed by every subject listed in table 1, since some of the first stools were strongly positive for blood. The hospitalized patients (table 3) were on medical and surgical wards, and no attempt was made to correlate their clinical status with the tests of the stools. Table 3 shows clearly that substituting benzidine dihydrochloride for benzidine base does not alter the sensitivity or specificity of the Gregersen test in any way.

COMMENT

The experiments described were carried out in a deliberate attempt to simulate the actual practice of stool examination among practitioners and laboratory technicians. None of the refinements of technique, such as

lies between 25 and 50 ml, i.e., the test cannot be relied on to detect with consistency single blood losses in the stomach of less than 25 ml.

The benzidine test showed, as expected, fewer negative tests in the stools passed by those ingesting 25 and 50 ml of blood, its use resulted also in a much greater percentage of 3+ and 4+ reactions than was the case with the guaiac test. The critical amount of ingested blood required for the Gregersen test to become positive is usually set at 3 to 5 ml.^{2c}

Since the critical level for the guaiac test seemed to lie between 25 and 50 ml of blood "lost," 11 normal subjects were fed daily 15 ml of packed red cells, equivalent to at least 30 ml of blood, over a period of four to seven days. In table 2 may be seen the complete record of all stools examined. It is apparent that in the majority of cases, the guaiac test failed to give more than a 1+ reaction, and in one subject, every stool passed was

guaiac-negative, whereas the benzidine test gave 3 or 4 + reactions in at least two stools for each subject. Statistical analysis of the results obtained with the two tests on the same stools reveals clearly (a) the superior sensitivity of the Gregersen benzidine test, and (b) the smaller variance of the results of this test as compared with those of the guaiac test. The statistical significance of the advantages of the benzidine test over the guaiac test increases with each successive day of the experiment, becoming relatively constant after the third day of the experiment. The stability of the results after the third day emphasizes once again the danger of drawing conclusions on tests of stools for the presence or absence of ingested materials unless the experimental conditions have been in operation for at least three days. Studies of steatorrhea have led to this same conclusion.³ It is obvious that a single random stool sample from any of these subjects, "losing" blood slowly but regularly into the upper intestine, might give a negative test for blood by either method, but this possibility is much greater with the guaiac test than with the Gregersen benzidine reaction, and the probability that two or more such successive stools would be negative to the benzidine test is very low.

Is this significant blood loss? A total of 20 ml per day for a month is 600 ml of blood, 30 ml per day is 900 ml per month. It has been adequately demonstrated that the suggested human daily requirement for iron, 15 mg, is not so easy to obtain from food as was formerly thought, in studies with radioiron in normal subjects Moore and Dubach⁴ found that only 10% of food iron is probably absorbed. If, then, there is added to the difficulty of assuring adequate iron intake the difficulty of demonstrating "minor" blood loss in the feces by the commonly used guaiac test, it becomes very difficult to defend the concept of "idiopathic" hypochromic anemia, when based solely on negative guaiac reactions, even on repeated stool samples.

It has been claimed⁵ that the benzidine test is too sensitive for ordinary use, giving many false positive reactions in subjects on ordinary diets. The sensitivity of the test seems to depend very specifically on proportions

between the benzidine and sources of peroxide, as well as on the type of peroxide used, as Leiboff has shown.^{2b} The modified Gregersen test used here has achieved a satisfactory adjustment of these factors. If one considers the subjects taking large doses of iron, plus meat-containing diets, as controls, one observes that of 248 stools examined, 68% were negative, 22% were 1+, 6% were 2+, and 4% were 3+. In other words, 10% of these control stools (passed by 6% of the control subjects) showed benzidine reactions of 2+ or 3+. With the guaiac test the comparable figure is 2%. It might be maintained that this is too high a percentage of false positive reactions. A screening procedure must be made sensitive enough so that no falsely negative reactions occur, and there is simply no way in which this can be accomplished without a certain accompanying percentage of falsely positive reactions. Benzidine does not give a reaction with iron, but occasionally may be weakly positive when the diet contains very large amounts of meat, especially liver, boiling a small fecal specimen for two to three minutes has been suggested^{2b} as a method of eliminating false positive reactions due to peroxidases, which conceivably are the most frequent source of error. In my opinion, the percentage of false positive reactions to the Gregersen test is not impressive, a reaction at the 2+ level of sensitivity indicates that blood loss is probably occurring and that repeated stool analyses are needed, these should be performed on a boiled aqueous suspension of feces. In this connection, it should be pointed out that the significant feature of table 3 is that the stools of five patients gave 2+ Gregersen reactions with negative guaiac tests. Based on the experience described above, at least four of these five subjects are losing blood into the gastrointestinal tract, and they would not have been identified by routine use of the guaiac test alone.

In a recent critical analysis of the modified Gregersen benzidine test, Needham and Simpson⁷ point out that the test is simple, well-standardized, free of uncertainty due to the deterioration of hydrogen peroxide, and almost independent of falsely-reacting articles of diet appearing in the stools. These authors used benzidine hydrochloride instead of benzidine base, the color reaction with the dihydrochloride is more stable than with the base, and, as may be seen from table 3, it does not differ appreciably from the base in sensitivity or specificity. The notorious reputation for over-sensitivity enjoyed by the benzidine test, which is still commonly used in this country, does not apply to this modified Gregersen procedure, possessing as it does only one-fifth the sensitivity of the unmodified test employing benzidine base and hydrogen peroxide. According to these authors, two important factors influencing the results of experiments of this type are (1) the dilution of blood lost into the intestine by the volume of feces passed, and (2) the undoubted fact that some blood lost in this way is absorbed in passing through the small bowel. With regard to the first factor, very large stools, which might dilute admixed blood, are rarely encountered in patients with gastrointestinal bleeding unless they are obviously bloody or tarry. In the experiments reported here no obvious changes in stool volumes were noted. The second factor

7 Needham C D and Simpson R G. The Benzidine Test for Occult Blood in Faeces. *Quart. J. Med.* 21: 123 (April) 1952.

bears some relation to the first, since a smaller stool represents a slighter degree of dilution of the blood lost, but because of normal or delayed intestinal motility, some of the blood in the lumen may be absorbed in passing caudad. In an interesting study, Andrews and Oliver-Gonzalez⁸ found that 15% to 70% of small amounts of ingested blood could not be accounted for in the feces. Since the studies reported here contain parallel analyses of the same fecal specimen by both tests, the two factors above described should affect these results equally.

In conclusion, it appears that the Gregersen modification of the benzidine test, at the 2 + level of sensitivity, performed as described here, is a far more adequate screening test than is the guaiac procedure for the purpose of detecting occult blood in the feces. Based on these studies, the guaiac test will regularly fail to detect 25 ml of blood loss into the upper gastrointestinal tract, and will often fail to indicate losses of 50 ml. Even daily losses of 30 ml of blood may not be detected by the guaiac test performed on every stool sample for five to six days. These data make quite understandable recent expressions of dissatisfaction with the ability of this test to detect occult bleeding presumed to be associated with proved gastrointestinal malignant lesions.⁹ False positive reactions do not present a serious problem with the benzidine test as herein performed.

SUMMARY AND CONCLUSION

1 After one ingestion of 25 ml of blood by 39 subjects, negative or 1 + guaiac reactions were recorded in 87% of 87 stools collected over the subsequent 72 hour

period. Negative or 1 + benzidine reactions (Gregersen technique) were recorded in 50% of these same 87 stools.

2 After a single ingestion of 50 ml of blood by 39 subjects, negative or 1 + guaiac reactions were recorded in 70% of 89 stools collected over the subsequent 72 hour period. Negative or 1 + benzidine reactions were recorded in 40% of these same 89 stools.

3 Of 248 stools passed by 120 subjects while taking ferrous iron, 180 mg daily, plus a meat-containing diet, 10% (from 6% of subjects) gave benzidine reactions greater than 1 +, 2% gave guaiac reactions greater than 1 +.

4 When 11 normal subjects ingested 15 ml of packed cells (equivalent to at least 30 ml of blood) daily for five to six days, the stools of no one subject failed to show benzidine reactions greater than 1 + on two or more days. The stools of four subjects failed to show guaiac reactions greater than 1 +, and one subject passed five daily stools that were guaiac negative. The difference between the benzidine reactions and the guaiac reactions is statistically highly significant. The Gregersen modification of the benzidine test, in which benzidine dihydrochloride and barium peroxide are used, possesses marked advantages over the guaiac test as a screening procedure for detecting occult blood in the feces.

USE OF HYPNOTICS IN AGING AND SENILE PATIENTS

A CLINICAL STUDY OF DORMISON

Philip R A May, M D

and

Franklin G Ebaugh, M D, Denver

Aging and senile patients often do not sleep well at night, a therapeutic problem for the physician. This insomnia may be the result of a natural diminution in sleep requirement, a part of the natural process of aging. It may, on the other hand, be a symptom of various psychiatric disorders, or it may be the result of physical disease, such as dyspnea or cough from cardiac failure or pulmonary disease, pain from duodenal ulcer, osteoarthritis, or nocturnal muscular cramps, or nocturia associated with prostatic disease or urinary tract infection. These patients not only may sleep poorly but, as the darkness and relative quiet of the night reduces their contact with and appreciation of their surroundings, may become agitated and confused, a process accentuated by the diminished cerebral oxygenation and metabolism associated with rest in the recumbent position. To reassure themselves of their surroundings, they may wander around in search of familiar objects and indulge in ceaseless rummaging through drawers and closets or in other confused activity. When there is severe loss of contact, delusions, illusions, and hallucinations may

appear. The patient may prowl the house in search of robbers or imaginary enemies, or there may be shouting, screaming, cursing, or outbursts of violence. Patients who are in good contact with their surroundings by day may be unmanageable at night, and if the patient is actually confused, deluded, or hallucinated during the day, he is usually worse at night. Disturbances are especially liable to occur when the patient is removed from familiar surroundings, when visiting away from home or on first admission to a hospital or a convalescent home. "Catnapping" during the day may be sufficient to compensate for sleep lost during the night, but sometimes the patient may wear himself out or come to serious harm as a result of occurrences such as accidental falls or the injudicious lighting of fires or gas jets.

The primary treatment of insomnia in the aging person is the treatment of the primary cause or at least the palli-

The Dormison used in this study was supplied by the Schering Corporation, Bloomfield, N J.

From the Colorado Psychopathic Hospital and the Department of Psychiatry, University of Colorado School of Medicine, Denver.

ation of aggravating factors, if possible, without recourse to the use of hypnotic drugs. The treatment of insomnia due to duodenal ulcer, heart failure, or nocturia from prostatic hypertrophy should be the proper medical management of the disease, not a large dose of a hypnotic. Even if the primary cause of the insomnia is irremediable, simple symptomatic relief measures, such as use of mild analgesics for the relief of the pain of osteoarthritis or antitussive agents for relief of chronic cough, may prove effective.

When the patient has obvious physical disease that keeps him awake and is not obviously psychotic, the proper treatment is clear, but even if the patient is obviously psychotic and there is no obvious physical disorder, thorough physical examination and appropriate treatment are essential. It is often forgotten that senile and arteriosclerotic patients, because of their diminished reserve, are apt to have toxic, delirious reactions with severe insomnia as a result of disease processes, infections, or toxemias that would not affect an ordinary person. Attention to proper hydration and nutrition, correction of vitamin deficiencies, and the treatment of infections (cellulitis, low grade bronchopneumonia, and renal tract infection are common offenders) are most important.

In patients in whom there is no treatable physical illness, conservative treatment is safest. A warm, but not too hot, bath before retiring may produce sufficient relaxation so that use of hypnotics may be avoided, and in some cases rolling himself up in a cocoon of blankets in bed may have a similar effect on the patient. In a hospital, formal hydrotherapy may be used. Nocturnal disturbances may sometimes be avoided by leaving a light on in the patient's room during the night.

Use of hypnotic drugs should be avoided as much as possible, since there is more danger of toxic reaction in older persons. This is the opinion of various workers, as shown by the following statements: "It is the general impression of most workers in the field that toxic states are produced more easily in people of advanced years."¹ "Barbiturate dosage should be considerably reduced for senile patients because they frequently become mentally confused on these drugs. Barbiturates often behave abnormally in the aged, either depressing the respirations more than usually or excessively exciting or depressing the higher centers."² "The happiest solution for insomnia in the aged is for the aged individual to find something to do—read, play solitaire, etc.—while the younger mem-

bers of the family are getting their needed sleep. Certainly one should be very chary of employing hypnotics in these oldsters for they sometimes react in a very excited manner to these drugs—the bromides and barbiturates seem to be the worst offenders in this respect."³ "recovery from symptoms of chronic barbiturate poisoning may be incomplete in elderly debilitated individuals. Bromides should be used with great care, if at all, in patients with advanced arteriosclerosis."⁴ "Chloral hydrate has to be used with caution in the debilitated and old."⁵ Lundy and Osterberg,⁶ in their review of the literature on the barbiturates, point out the decreased tolerance of those of advanced age for barbiturates and state that, since toxic effects may occur with therapeutic doses, they should be administered with caution, especially if the elderly person has pulmonary or renal disease. Even the use of alcohol, often lauded as a safe hypnotic, is accompanied by dangers. "Pathological intoxication is not infrequently seen in the senile."⁷

Potential dangers are associated with any therapeutic agent. Their mere existence should not be a deterrent to using a drug when necessary, provided the hazards are clearly recognized. It may be said with some degree of truth that a drug is as safe as the physician who uses it. Hypnotic drugs may and should be used in aging and senile persons in certain definite situations, when the conservative measures mentioned prove insufficient. They should be used only under strict medical supervision, with careful observation for warning signs of toxicity and with strict attention to maintenance of adequate fluid intake and nutritional and electrolyte balance.

When a patient is disturbed in his behavior or is dangerous to himself or others at night only, judicious use of an hypnotic may make possible use of a convalescent home, when it would otherwise be necessary to arrange permanent institutionalization in a hospital or mental hospital. In hospital practice, hypnotics may be useful in patients whose insomnia is leading to exhaustion or whose nocturnal behavior is grossly disturbing to other patients.

It must be recognized that there is no such thing as an absolutely safe hypnotic. According to Gunn, "It is idle to expect that a drug which has sufficient pharmacological activity adequately to depress the brain will not fail in larger doses to spread its actions. The history especially of hypnotics reveals a procession of drugs which have been introduced—with the claims that they are 'therapeutically active' but 'non-toxic' and not a single example has entirely lived up to this twofold recommendation."⁸ The best that can be done is to select a short-acting drug that is readily metabolized, that has a wide margin of safety between the therapeutic and toxic doses, and that has a relative freedom from lack of side-effects. Paraldehyde is generally and justifiably regarded as the safest hypnotic for elderly persons, its vile taste and the repellent smell that lingers on the breath for 24 hours or longer after a single dose are the main drawbacks to its use. The persistent odor on the breath tends to create a false sense of security by producing the false impression that paraldehyde is excreted by the lungs, when actually about 80% is detoxified by the liver. Recently, we have studied the use of a new type of hypnotic, Dormison,

which has proved in our experience to be as safe as paraldehyde for older patients but lacks its disagreeable taste and smell

DORMISON

Dormison (3-methyl-1-pentyn-3-ol), unlike other hypnotics in common use, with the exception of paraldehyde, contains only carbon, hydrogen, and oxygen and is not related to the opiates, the barbiturates, or chloral hydrate. It resembles paraldehyde in being a liquid, aliphatic, non-halogen compound with the same number of carbon atoms, but it is otherwise not related to it. Pharmacological studies⁹ show that Dormison has a high margin of safety. The lethal dose in rats (LD 50) is about 80 times the effective dose in man, and respiratory depression is not produced in dogs by doses corresponding to 70 times the effective dose in man. It is short-acting and rapidly metabolized, after intravenous administration in dogs no drug could be detected in the blood after two hours. In acute and chronic toxicity tests, no organic, tissue, or metabolic disturbances due to the drug could be detected, and no undesirable effects were noted. In animals, Dormison has a highly specific hypnotic effect. Even large doses did not produce anesthesia, analgesia, antispasmodic activity, or vasomotor, cardiac, or respiratory depression.

Preliminary clinical reports of the use of Dormison by Margolin and co-workers,⁹ Gangemi,¹⁰ Allen and Krongold,¹¹ and Hirsh and Orsinger¹² have confirmed its efficiency, rapid onset of action, and relative lack of side-effects. Hirsh and Orsinger¹² report that 78% of 195 patients receiving doses of 100 to 500 mg went to sleep within two hours and that 86% of 120 patients slept for five hours or longer. Best results were obtained with doses of 300 to 800 mg. Of those given 500 mg, 93% were asleep in one hour and 97% in two hours, 92% slept five hours or longer. Side-effects were noted in only 8 of 195 patients. 5 complained of hang-over, 2 of nausea, and 1 of a bad taste in the mouth. Cumulative toxic effects, drowsiness, ataxia, and dizziness, were reported only when the drug was used as a sedative, not when used as an hypnotic only.¹⁰ None of these reports has dealt with the use of the drug in elderly persons, except that of Gangemi,¹⁰ who administered it to three patients with cerebral arteriosclerosis, abandoning its use when two became excited after single doses of 250 mg. He noted, however, that the occurrence of excitement may have been coincidental, since these patients had been excited from time to time before they were given Dormison.

METHOD AND MATERIALS

Composition of Test Group—It was apparent from the preliminary reports that short action, low toxicity, relative lack of side-effects, and stupeficient action were potential advantages that might make Dormison extremely useful in aging and senile patients. Accordingly, Dormison was tested as an hypnotic in 52 patients aged 61 or over. All were in a psychiatric hospital during the time of administration of the drug, the majority being in the wards for more seriously disturbed patients, and only five were not psychotic. Seventeen patients were in the age group 61 to 70, 20 were in the group 71 to 80, and 15 were over age 80. The average number of nightly trials was 6.4 for each patient, and the average total dose

was 8.19 gm. The longest trial was that in a 74-year-old patient, who was given 21.25 gm over 26 nightly trials in 29 days. The largest total dose was 33.5 gm given over 12 nightly trials in 12 days to a 65-year-old man with a manic psychosis. The oldest patient was a 90-year-old man, who was given 14.75 gm in 13 nightly trials over 13 days. The dose range tested was from 0.25 to 2.25 gm.

Method of Administration—Dormison is available in 250 mg capsules and as an elixir containing 62.5 mg per cubic centimeter. At present, no form of Dormison is available for parenteral administration, and this study does not include patients who refused to take oral medication. The elixir was used almost exclusively for the following reasons: 1. It is taken more easily than capsules by elderly persons. 2. It permits more flexible variation of dosage. 3. A large dose may be given as easily as a small one, it is impracticable to give large doses of Dormison in capsule form because of the large number of capsules that would have to be taken (e.g., 2 gm equals eight capsules). 4. Psychiatric patients occasionally keep capsules in their mouth and spit them out later. They may even be saved for suicidal attempts. Use of the elixir eliminates these two problems.

Capsules were given to only one patient, an irascible woman who spat out the elixir. Orders were written to allow a repeat dose to be given once during the night, if required, but an attempt was made to adjust the dose so that an optimum result would be produced without a second dose. Table 2 includes data on the frequency with which repeat doses were required. A "sleep chart" for the period 9 p.m. to 6 a.m. was kept for all patients. A nurse checked each patient every half hour, and if the patient was awake the corresponding half hour period was blocked in as "awake."

Hypnotic Effect and Efficiency of Dormison—The hypnotic effect of a dose of Dormison was classified as "good" if the patient had six hours' sleep or more after the drug was given. If the drug was given too late in the night to permit six hours' sleep, a duration of five and one-half hours was classified as "good" if the patient went to sleep within an hour and slept without waking until 6 a.m. If the patient was not asleep within two hours, the result was classified as "poor," regardless of the duration of sleep. In estimating the efficiency of an hypnotic drug, not only the optimum result but also the consistency with which this result is achieved must be taken into account. We considered that the drug had been "efficient" if the largest dose given to the patient produced a "good" night's sleep on 80% or more of the nights that it was used.

RESULTS

The main observations from this study are summarized in tables 1 and 2. Since all patients studied had been admitted to the hospital because they had definite psychi-

atric disorders and were unmanageable at home, in a convalescent home, or in a general hospital, it is hardly surprising to find that larger doses of Dormison were required than in the other studies that have been reported, which dealt mainly with younger, undisturbed patients. From graphs in which therapeutic result was plotted against the dose of Dormison, we estimate that a dose of 1 gm will produce an efficient result in 50% of psychotic aged persons and that a dose of 1.5 gm will produce an efficient result in 75%.

TABLE 1—*Relation Between Dose and Effectiveness of Dormison*

Dose Gm	% Trials Showing Good Result *	% Patients Showing Efficient Result *
0.25	0.8	2
0.50	3	4
0.75	22	26
1.00	64	60

1.75	93	88
2.00	97	94
2.25	100	100

* The figures shown are cumulative i.e., they indicate the percentage of good or efficient results obtained with the dose shown or a smaller one. These figures have been corrected to allow for patients in whom trial with the full dosage range was not possible.

TABLE 2—*Relation of Effectiveness of Dormison to Type of Disorder**

Diagnosis	No. of Patients	Average Dose Required for Efficient Result Gm	% of Patients Showing Efficient Result	Frequency of Need for Repeat Dose †	
				% of Patients	No. of Nights
Cerebral arteriosclerosis with alcoholism (not psychotic)	5	1.00	100		
Cerebral arteriosclerosis with psychotic depressive reaction	2	1.60	100		
Cerebral arteriosclerosis with manic reaction	1	2.25	100		
Other types of psychosis due to cerebral arteriosclerosis or senility (uncomplicated)	87	1.02	70	9	1 in 2.8
Psychosis due to cerebral arteriosclerosis or senility complicated by additional serious illness ‡	7	1.75	29	43	1 in 3.4
Total	62	1.11	69	18.5	1 in 2.5

* The percentages shown have been calculated to two significant figures; their use does not imply that we are unaware of the danger of attaching too much significance to percentages in small groups.

† This column indicates the percentage of patients with the disorder listed who required a repeat dose for optimum results and the frequency with which a repeat dose was required by these patients.

‡ Advanced carcinoma 3, uremia 1, heart failure and pulmonary infarct 1, aplastic anemia 1, and thrombophlebitis 1.

It has been our experience that the dose of Dormison required is related more to the psychiatric state of the patient, to the severity of the behavior disturbance, than to his age per se, for example, depressed and manic patients required larger doses than patients who were either nonpsychotic or who had other types of psychosis. In comparing patients with similar degrees of psychiatric disturbance, it is found that patients aged 80 to 90 require about the same dose as those aged 61 to 70. Our experience with patients below age 60, with the exception of those who are frail and feeble, indicates that there is little difference between young and old psychiatric patients in the amount of Dormison required for a hypnotic effect.

These statements should not be construed as indicating that we advocate the reckless administration of large doses. The physical condition of the aging patient must be evaluated carefully, and, if it is found to be good, a dose in the range of 0.5 to 1 gm should be tried first, no matter how disturbed the patient may be. If this is not adequate, the dose may be increased with safety by 0.25 gm each night or two, until the desired effect is obtained. We did not find it necessary to give more than 2.25 gm to any patient in this study, and we did not find it necessary to give more than 1.75 gm to any patient over 70 years old. Our one 90-year-old patient was given nine doses of 1.25 gm each without ill effect.

It should also be noted that we have been dealing with patients whose illness was so severe as to require admission to a psychiatric hospital. Less disturbed persons will probably require smaller doses for an hypnotic effect. In patients who are seriously physically ill, poor results must be expected with Dormison, as with any other hypnotic drug. This serves to emphasize the fact mentioned previously that the only really effective treatment of insomnia associated with physical disease is the proper treatment of that disease.

Toxic effects were relatively rare and were confined largely to patients with serious physical disorders. One patient vomited two doses of the elixir. This was a 65-year-old man with intractable pain from terminal multiple myeloma, for which he was receiving large doses of meperidine (Demerol), who vomited spontaneously on several occasions. One patient, a severely disturbed 67-year-old man with delirium associated with chronic pemphigus and metastatic carcinoma, tolerated single doses of 2 gm satisfactorily but was objectively drowsy on the morning after it had been necessary to give two doses of 2 gm to produce a good night's sleep. On the next night he was given paraldehyde, two doses of 8 cc were necessary to produce a good night's sleep, and there was the same degree of drowsiness the next morning as had resulted from Dormison. Only two patients (3.8%) complained of the taste of the elixir, one 87-year-old man said that it burned his throat, but he continued to take it, and one 78-year-old woman spat out the elixir but tolerated the capsules. We subsequently learned that the taste of the elixir may be disguised satisfactorily by mixing it with fruit juice.

The experience of this study would suggest that Dormison is a reliable and relatively safe hypnotic for aging and senile persons. It appears to have about the same margin of safety as paraldehyde, without the disadvantages of a vile taste and persistent smell, so that it may be regarded as probably the hypnotic of choice for this group of patients.

SUMMARY AND CONCLUSIONS

Hypnotics should be given to aging and senile patients only when conservative measures and the treatment of physical illness have failed to relieve insomnia and then only if certain definite indications exist. The patients must be carefully observed for signs of possible toxicity. Poor results may be expected in patients with complicating physical disorders. Despite the fact that the dose

of hypnotic required is related more to the degree of psychiatric disturbance and to the general physical condition of the patient than to his age per se, a relatively small dose should be tried at first, regardless of the degree of behavior disturbance. When an hypnotic is

required, Dormison may be regarded as probably the hypnotic drug of choice, it has a margin of safety comparable to that of paraldehyde without the vile taste and persistent smell of the latter drug.

1801 High St. (Dr. May)

ANESTHESIOLOGY AS AN AID TO OTHER FIELDS OF MEDICAL PRACTICE

John S. Lundy, M.D., Rochester, Minn

The term anesthesiology began to be used commonly about 1937 to designate a special field of medical practice that included many activities ordinarily not considered in the realm of anesthesia, the specialist in this new field was termed an "anesthesiologist," rather than an "anesthetist." The anesthesiologist's primary concern, of course, is his work in the operating room, however, he can widen his field by assisting in the management of conditions other than those directly associated with surgical anesthesia. The anesthesiologist of the future must be better informed about many conditions, both common and uncommon, than he has been in the past. As an example, the anesthesiologist must be familiar with the effects of administration of cortisone and corticotropin (ACTH). Since prolonged administration of cortisone may result in atrophy of the adrenal cortex and render it depressed or nonfunctioning, patients who have been receiving cortisone must not be subjected to the stress of anesthesia and surgery until they have been properly prepared. Preparation consists of intramuscular administration of cortisone in daily doses for an adult of about 100 mg for two or three days before surgery and on the day of operation. Administration of this amount is continued for two or three days after operation, the dose is then reduced gradually to the maintenance level.

In view of the dangers inherent in the use of cortisone and corticotropin,¹ the anesthesiologist, as well as the surgeon and internist, must be informed about these hormones. He must be prepared to give adrenocortical extract to the patient during operation if necessary. For this purpose, it is hoped that a preparation of hydrocortisone suitable for intravenous use will be available in the future. The anesthesiologist must be able to recognize the atypical picture of shock that occurs under such conditions and be cognizant of the lack of response to ordinary measures in the treatment of such shock. He should obtain detailed information from either the patient or his relatives about any previous cortisone or similar hormonal treatment that the patient may have received. For various reasons the surgical team is not always informed when a patient has received cortisone. All efforts should be made to avoid this situation.

If the anesthesiologist wishes to be as helpful as possible in alleviation of pain, he must investigate the various analgesic drugs and their doses, indications, contraindications, and antidotes, for example, in cases of attempted suicide from an overdose of morphine, the antidote N-allylnormorphine should be administered. Stimulants, supportive therapy (such as use of oxygen), and sometimes artificial respiration, are required to counteract the effects of overdoses of the barbiturates, in such cases the

anesthesiologist can be extremely helpful. He may also be useful when resuscitative measures are required, as in the newborn. Use of the laryngoscope naturally leads to use of a bronchoscope or use of a long woven-silk catheter for aspiration of material in the air passages. Ability to perform such procedures permits the anesthesiologist to be of real value in emergencies when the services of a bronchoscopist cannot be obtained or when there is no bronchoscopist at all. The anesthesiologist's ministrations may be lifesaving to patients who have become extremely anoxic from an overdose of an anesthetic agent or from respiratory obstruction. Such patients may become decerebrate and will either die or become mentally incapacitated if prompt and adequate treatment is not given. These patients have responded well to use of concentrated serum albumin,² but this material is expensive. The use of a 20% salt-free solution of dextran accomplishes about the same results at approximately one-tenth of the cost of the serum albumin.

The anesthesiologist can perform diagnostic and therapeutic nerve blocks when pathways of pain must be determined so that treatment, either surgical or nonsurgical, can be decided on. The accuracy of the injection should be proved by roentgenograms showing the location of the points of the needles. The solutions used for such blocks are not always adequate. Local anesthetic solutions usually give too few hours of anesthesia to allow positive conclusion that the pathway of pain has been blocked. Blocks by means of absolute alcohol or 6% solution of phenol in water have been associated with occasional difficulty. Use of a solution containing 0.75% each of ammonium sulfate and of benzyl alcohol, has not been uniformly successful, and stronger solutions have been tried. I have had varied experience with a solution called PAB₂, which contains 0.5% procaine hydrochloride, 2.5% ammonium sulfate, and 2% benzyl alcohol, in some cases the solution has been altered to contain 1% or more of procaine. The use of this material has not been followed by untoward results, and the period of relief from pain, in some cases, has been as long as two

From the Section of Anesthesiology and Intravenous Therapy, Mayo Clinic.

A. 149: 1542-1543 (Aug. 23) 1952.

2. Seldon T. H. Faulconer A. Jr. Courtin R. F. and Pino D. M. Postanesthetic Encephalopathy: The Postulation of Cerebral Edema as a Basis for Rational Treatment. Proc. Staff Meet. Mayo Clin. 24: 370-374 (July 6) 1949.

to three months. In most instances, relief lasts at least several days, so that definite information can be obtained regarding the pathway of pain, provided roentgenograms have been made to check the accuracy of the needle's position.

The anesthesiologist is, of course, familiar with transfusion with blood and plasma. The commonly used solutions such as 5% dextrose in isotonic solution of sodium chloride and 5% dextrose in water and the various expanders of plasma volume, such as dextran, polyvinylpyrrolidone, gelatin, and more recently, modified human globin, are materials that the anesthesiologist knows about and is prepared to use. Various techniques, such as the use of 10% salt-free solution of dextran in dehydration of patients who have nephrosis, are being evaluated.³ Use of such a solution seems indicated even if its success is questionable. If little response has been obtained after a week of daily treatment, continuation probably is futile. On the other hand, if the patient does respond quickly the treatment should be continued until the patient is in a relatively satisfactory condition. Throughout the entire period, however, all accepted methods of treatment should be utilized in addition to use of dextran.

The anesthesiologist has an important role in the improvement of immediate postanesthetic care. Such care requires use of an adequate room, in or close to the surgical suite, where patients can be cared for by a specially trained group and where the anesthesiologist or the surgeon or both may see the patient at intervals without absenting themselves from the area of the operating rooms. These facilities probably will become standard hospital

equipment. Certainly the institutions that now use such rooms would not consider their elimination.

I have mentioned just a few of the activities that fall naturally in the field of the anesthesiologist and that allow him to make a broad contribution in the hospital or community. It is not my intention to indicate that the anesthesiologist wishes to intrude in fields where he is not needed, but I would suggest that if he is encouraged to investigate other activities it will be apparent shortly whether he is helpful. The amount of time an anesthesiologist can give to activities outside the operating room becomes evident after a trial. The real reason for his specialization is to aid in surgical technique, whether the operation is a simple dental procedure or an intricate operation in another special field.

The caliber of the surgical team can be raised or lowered considerably by the quality of the anesthesiologist's work. So many agents and methods are at the disposal of the modern anesthesiologist that he should be able to anesthetize almost anyone for any sort of an operation with relative safety. The risk of anesthesia to the patient has been lessened, regardless of the type of disease necessitating operation or the presence of other diseases or complicating factors. The decreased risk applies also to a consideration of how much anesthesia can be used without causing hazard of fire or explosion. In my experience anesthesiologists today have reached a point where they can do a better all-around job than ever before.

CORTICOTROPIN AND CORTISONE IN INTRACTABLE ANOGENITAL PRURITUS

Robert Turell, M D , New York

Since the introduction of corticotropin (ACTH) and cortisone into clinical medicine¹ and surgery,² I have observed several patients with refractory anal pruritus who have responded dramatically well to one³ or both of these hormones and others who have failed to be relieved appreciably. In the successful cases, the pruritus invariably recurred after variable periods of time following the discontinuation of therapy. As a result of these observations, I instituted a formal study to evaluate this new therapeutic measure. As a background for this study, my personal experience with the management of recalcitrant anogenital pruritus was utilized.⁴ Treatment during the past decade of more than 200 patients

with refractory, long-standing anogenital pruritus by tattooing of the involved skin with mercury sulfide has led to the classification of these patients according to their therapeutic response. Patients without cutaneous involvement were never benefited by tattooing, those with dry, tense pruritic skin formed the unpredictable group, whereas those with moist lichenified skin always responded well to this form of therapy. The cutaneous involvement invariably appears in one of two forms: (1) a thickened, shiny, usually red, and tense but dry skin, and (2) a moist skin with greyish-pale hyperpigmentation, fissuring, and excoriation.

METHOD AND MATERIALS

Corticotropin (Acthar) gel (more recently the highly purified hormone has been used), hydrocortisone acetate, and cortisone acetate were used in variable dosages. The most recent dosage of corticotropin gel employed consisted of 80 units administered intramuscularly in two divided doses the first day and 40 units daily thereafter for 7 to 14 days. Except for two patients in group 1, all were ambulatory. In some cases, a daily maintenance dose of 20 units of corticotropin was administered for an additional week, or cortisone in doses up to 50 mg daily was given for several weeks for maintenance.

The corticotropin used in this study was supplied by Dr. R. I. Feldman and Dr. R. J. Meyer, the Armour Laboratories, Chicago; the hydrocortisone acetate was supplied by Dr. E. Alpert, Merck & Company, Inc., Rahway, N. J., and the cortisone acetate was supplied by Dr. N. L. Hemmings, Schering Corporation, Bloomfield, N. J.

4. Turell R.: Treatment in Proctology. Baltimore: Williams and Wilkins Company, 1949.

During the early part of this study, 1 gm of potassium chloride was given three times daily by mouth. This medication was later discontinued, because it was found to be unnecessary. Hydrocortisone was injected under the perianal skin in amounts varying from 2 to 5 cc (50 to 125 mg). Cortisone, when employed, was given orally in doses up to 200 mg daily in four divided doses. No other medication was used concomitantly.

Except for one patient with mild diabetes mellitus, all patients receiving the foregoing hormonal therapy were free from symptoms and signs of organic disease, except for the pruritus. In two patients, electrocardiograms and determinations of the serum potassium level were made every third day, results of these tests were normal. The diabetic patient was examined by his referring internist on the fourth day of treatment, no exacerbation of diabetes had occurred. All patients were interrogated daily about the presence of allergic reactions, weakness, fatigue, insomnia, nervousness, and gain in weight.

CLINICAL RESULTS

Group 1 Acute Exacerbations—Three patients with acute exacerbations of chronic, refractory anogenital pruritus were treated. All had a moist type of lichenification of the anoperineovulval skin associated with considerable swelling and numerous recent scratch marks. All were on the verge of mental despondency. One patient received 40 units of corticotropin gel during the first 24 hours and the other two received 40 units every 12 hours during the first day and 40 units daily thereafter for 7 to 12 days. Relief from pruritus was evident within less than 12 hours after the initial injection, with rapid cessation of the itching in the subsequent 36 hours. Within 36 to 48 hours the cutaneous lesion began to "dry up," and most of the superficial fissures and/or excoriations appeared healed within four to six days. Of interest is the recurrence within five days of vulval pruritus in one patient during corticotropin therapy, while at the same time she remained free from anal itching. Cortisone administered orally in a dose of 200 mg daily to one patient for two days appeared less effective than corticotropin gel.

Group 2 Chronic Intractable Anal Pruritus—Seven patients with anal pruritus of from 5 to 20 years' duration, which was associated with moist lichenification and which was refractory to all accepted forms of treatment, except the radical forms, were given corticotropin gel. Three patients received 40 units daily, while four patients received larger amounts. Some relief of pruritus was noted after the administration of the first dose, and increasing relief followed the injection of the second dose. This observation led me to increase the initial dose to 80 units, resulting in somewhat corresponding improvement of the therapeutic response. Cortisone, administered orally in a dose of from 100 to 200 mg daily, did not seem to produce comparable results. In one patient pruritus recurred on the fifth day while she was still receiving this dosage of cortisone.

Since discontinuation of the corticotropin gel therapy, one patient has remained pruritus-free for four months, while recurrence of mild pruritus was discernible in a little more than two weeks in the remaining six patients. Although in two patients the original severity of the

itching was observed only 25 days after withdrawal of the hormone, in four patients the original intensity of the pruritus failed to return, even after a lapse of 14 weeks. All of these patients responded well to retreatment, corticotropin having been employed in four and cortisone in the remaining two.

The pruritus of two patients with "dry," shiny, tense, and thickened perianal skin responded considerably more slowly to corticotropin therapy than the corresponding pruritus in patients with "moist" skin. In these patients, substantial relief of pruritus was noted about three to five days after the institution of corticotropin gel therapy. The skin became less tense and less shiny. Itching returned within one week after withdrawal of the hormone, but these patients responded more quickly to retreatment than to the initial course of therapy. Cortisone therapy was not tried in the patients of this subgroup.

Hydrocortisone, in amounts varying from 2 to 5 cc (50 to 125 mg) was injected under the perianal skin, first in one quadrant and five days later in two quadrants on the opposite side, in two patients with pruritus who had the moist type of perianal skin and who, about one month before, had responded well to corticotropin gel. In each instance, the recurrent pruritus of the injected area disappeared, and the patient remained pruritus-free for two to seven days. Histopathological examination of surgically excised segments of the treated skin of one patient revealed no unusual features.

Group 3 Severe Pruritus Associated with Proctologic Lesions—Patients with moderately advanced lichenification of the perianal skin, associated with redundant skin in two instances, with large, prolapsing internal and external hemorrhoids in two instances, with an anal fistula in one instance, and with anal fissures in two instances, were treated alternately with corticotropin and cortisone for 7 to 10 days. In the patient with the anal fistula and in one with a deep anal ulcer, both drugs were completely ineffective, these lesions had to be treated surgically. In one patient, a superficial fissure healed temporarily when either hormone was given. The epithelial layer healed rapidly, but the subcutaneous tissues did not heal effectively, and thus a "dead space" was formed, the healed epithelium was vulnerable to the slightest defecatory trauma. The patients with redundant perianal skin and those with large, mixed hemorrhoids experienced moderate relief from pruritus as a result of the administration of either corticotropin or cortisone. The relief was not, however, so clear-cut as it was in the patients of group 2, even though the pruritus and the disease status of the perianal skin was more advanced in the latter patients. Retreatment of three patients with corticotropin and cortisone alternately after operation yielded far better results.

Group 4 Refractory Pruritus Without Cutaneous Involvement—Five patients with refractory pruritus without cutaneous involvement failed to respond to either corticotropin gel or cortisone. All of these patients appeared to be neurotic, some of them utilized their itching in the interest of a psychological need, the perpetuation of which seemed to serve an important psychodynamic function.

Group 5 Anal Pruritus Secondary to Ulcerative Colitis or Antibiotic Therapy—Anal pruritus either secondary to or associated with moderately severe ulcerative colitis in one patient responded to corticotropin therapy in direct proportion to the improvement of the ulcerative colonic process.⁵ In two patients, anal pruritus as a manifestation of toxic side-effects of the broad spectrum antibiotics was relieved considerably by either corticotropin or cortisone. It should be remembered, however, that both of these conditions are apt to disappear spontaneously.

Side-Effects—A mild, generalized erythema, especially of the neck and upper part of the chest, and menometrorrhagia were observed in a woman 46 years of age after the administration of a total of 120 units of corticotropin gel. The cutaneous eruption disappeared after oral administration of 8 mg every 12 hours of chlorphenylpyridamine (Chlor-trimeton) maleate, without discontinuation of corticotropin therapy.

COMMENT AND CONCLUSION

Corticotropin, cortisone, and hydrocortisone as the sole treatment for severe anogenital pruritus is useful in the management of patients with acute pruritus belonging to group 1. In these patients it holds in abeyance or reverses the acute pruritic process, thus affording the patient fairly rapid relief and, at the same time, affording the proctologist an opportunity to employ effective and rational measures to control the underlying and precipitating causes of this pernicious type of pruritus. This new method of treatment is equally useful for most patients of group 2. I have observed that patients of group 2 who respond readily to corticotropin or to any of the adrenal corticoids, such as cortisone or hydrocortisone, also respond to tattooing of the involved skin with mercury sulfide for permanent results. In fact, I now employ these hormones as a test preliminary to tattooing; the quick responders appear to be good candidates for this radical therapeutic procedure.⁴ Patients with pruritus but with no associated cutaneous changes do not respond to hormonal therapy, and those with "dry," lichenified skin respond erratically. As already stated, only hormonal therapy was used in the present study, however, other antipruritic therapeutic measures have been employed concomitantly with this form of hormonal therapy by other clinicians.⁶ Since these hormones have a powerful pharmacodynamic effect and since the basic mechanism of their action is still not clarified, they should be employed cautiously.

This study also shows that proctologic lesions associated concomitantly with anal pruritus should be eliminated surgically. In general, a cure cannot be expected from any form of antipruritic therapy unless associated proctologic lesions, regardless of their etiologic importance in pruritus, are extirpated.⁴

CLINICAL NOTES

HEMIPLEGIA RESULTING FROM PHEOCHROMOCYTOMA

REPORT OF CASE

William H. ReMine, M.D.

J. Earle Estes Jr., M.D.

Malcolm B. Dockerty, M.D.

and

James T. Priestley, M.D., Rochester, Minn.

Pheochromocytoma can no longer be regarded as a pathological or surgical curiosity, inasmuch as recent reports indicate an increase in the frequency of diagnosis of this tumor. Refinements in laboratory diagnosis and in the management of patients with hypertension of the paroxysmal or sustained type resulting from a chromaffin tumor of the suprarenal gland have progressed significantly in recent years.¹

In 1929, Pincoffs² reported the first case in which a pheochromocytoma was diagnosed and treated successfully. Since then, more than 100 cases of this tumor have been reported in the literature. With the advent of the Roth-Kvale histamine test in 1945,³ impetus was given to the study of this lesion. In 1947, Goldenberg, Snyder, and Aranow⁴ described a different type of diagnostic test, which utilized the adrenolytic drug piperoxan (benzodioxan) hydrochloride. In addition, another adrenolytic agent, Regitine (2-[N-p-tolyl-N-(m-hydroxyphenyl)-aminomethyl]-imidazoline) has been used in the diagnosis of pheochromocytoma, and some authors⁵ believe that it is superior to piperoxan hydrochloride. Calkins, Dana, and Howard⁶ and Calkins and Howard⁷ recently reviewed the various current methods of diagnosis of pheochromocytoma and concluded that the Roth-Kvale histamine test is the most reliable one in the diagnosis of chromaffin adrenal medullary tumors. Recent studies by Kvale and Roth⁸ indicate that the histamine test is most accurate in the diagnosis of pheochromocytoma that causes paroxysmal hypertension.

whereas Regitine produces most reliable results when sustained hypertension exists

Bilateral pheochromocytomas occur in at least 9% of cases⁹ if not more, and a pheochromocytoma may have an ectopic site in 10% of cases. In view of these facts, it is our practice usually to explore transabdominally through an upper transverse incision in order that both suprarenal glands and other portions of the abdomen may be adequately examined. This tumor has been found to be malignant in 11% of cases¹⁰

Difficulty in the diagnosis of pheochromocytoma is caused by the variable clinical manifestations of these tumors. In part, these depend on whether abnormal quantities of pressor agents are present intermittently or constantly in the circulating blood. Hypertension of the sustained type has been reported in 25% of cases, but in our experience this has occurred in 11 (44%) of 25 cases. Patients who have paroxysmal hypertension caused by pheochromocytoma experience periodic attacks, usually of brief duration but occasionally persisting longer. These attacks are characterized by one or more of the following symptoms: anxiety, headache, precordial and epigastric distress, blanching of the extremities, perioral pallor, shortness of breath, tachycardia, palpitation, nausea or vomiting, profuse sweating, and tremor. Pressure over the tumor, hypoglycemia, exertion, and emotional upsets may precipitate the attacks, although most attacks seem to occur spontaneously.

We shall report a case of pheochromocytoma that emphasizes the serious manifestations that this tumor may produce. Particularly, it demonstrates the close cooperation of medical and surgical services that is necessary for the proper treatment of a patient with pheochromocytoma.

REPORT OF A CASE

A white boy, aged 18 who had had progressive hypertension since 1941, first registered at the Mayo Clinic on March 14, 1950. His chief complaints were easy fatigability and profuse sweating of the scalp and face. A diagnosis of rheumatic fever had been made in 1941, and he then had been told that he had hypertension and a "leaking heart." Fever had occurred at that time and had lasted for four months. During this period, his temperature had reached 101 F. Hyperthyroidism also had been considered as a possible diagnosis. During the eight years before the patient came to the clinic, the values for the systolic blood pressure had fluctuated between 160 and 240 mm Hg. The corresponding values for the diastolic pressure were not known. Since 1943, he had carried on relatively normal activities both in school and in helping with his share of farm work. The mother at times had noted profuse sweating over the upper half of his body and a tremor of his hands. No history of edema, dyspnea, orthopnea, or cough could be elicited. After severe exertion, he suffered from weakness and trembling. There was no familial history of hypertension.

The patient was 5 ft 6 in (167.6 cm) tall and he weighed 133 lb (60.3 kg) at the time of his initial examination at the clinic. His face was flushed and he was perspiring. His temperature was 99.2 F. The heart was enlarged, and it extended to the anterior axillary line of the left side. The apical beat was forceful, and auscultation disclosed a loud precordial systolic murmur, which was most intense at the pulmonic area. A thrill was easily palpable at this site. While the patient was lying down, the blood pressure was 190/120 mm Hg in both arms and 220/130 mm Hg in the left leg. The blood pressure in the right arm was 165/120 mm Hg while the patient was standing and 180/125 mm Hg while he was sitting. The pulse

rate was 108 beats per minute. The following diagnoses were considered: (1) congenital heart disease with hypertension, (2) pheochromocytoma, and (3) malignant hypertension.

On March 18, 1950, the patient felt unusually weak and he could not shave because of incoordination involving the right arm and hand. Eating also was difficult for the same reason. When the patient attempted to walk, he had to be assisted because of an unsteady gait and weakness of the right leg and foot. He was admitted to the hospital. He soon became drowsy and fell asleep. At the time of his admission to the hospital, his blood pressure was 290 mm Hg systolic and 170 mm Hg diastolic. Progressive aphasia developed a short time later. Eight milligrams of piperoxan hydrochloride were administered intravenously. The blood pressure decreased from 250/160 to 180/116 mm Hg in three minutes. It was believed that the patient had had an intracranial hemorrhage and that a pheochromocytoma undoubtedly was present.

The patient's right arm became flaccid, and moderately severe stiffness of the neck became apparent. The drowsiness progressed to unconsciousness, and breathing of the Cheyne-Stokes type developed. Lumbar puncture produced bloody spinal fluid. The pressure of the cerebrospinal fluid was 32 cm of water. On the evening of the same day, a total of 9 mg of piperoxan hydrochloride was administered intravenously at the rate of 1 mg per minute. The effect of this medication on the blood pressure is shown in table 1.

TABLE 1—Effect of Intravenous Injection of Piperoxan Hydrochloride on Blood Pressure*

Minutes After Injection Was Started	Blood Pressure Mm Hg	
	Systolic	Diastolic
1	210	140
2	200	130
3	186	120
4	170	120
5	175	120
6	175	120
7	175	116
8	165	110

* The systolic and diastolic pressures were 205 and 145 mm Hg respectively before injection of the drug was started.

After this medication, the patient's physical condition improved somewhat. He became conscious and rational and some motion returned in the right hand. Continuous intravenous infusion of a 5% aqueous solution of dextrose containing 16 mg of piperoxan hydrochloride per 1,000 cc was started on the evening of the same day. Additional piperoxan hydrochloride was added to the solution subsequently. This regimen produced a moderate reduction in the blood pressure. During the infusion of the piperoxan solution, the systolic blood pressure ranged between 205 and 170 mm Hg, and the diastolic pressure ranged between 150 and 106 mm Hg. The infusion was continued throughout the following day and night. At the end of that time, the patient's general physical condition appeared to be slightly improved, although he remained slightly aphasic and stuporous. Persistent tachycardia was present, perspiration was increased, and the patient was restless.

Excretory urography revealed that the right kidney was lower than normal. Although it appeared to have been depressed by an extrarenal mass, a definite mass could not be demonstrated in the urogram. Scattered areas of calcification were present above the right kidney. Roentgenographic examination of the thorax revealed an area of decreased density in the axillary portion of the right seventh rib, which was considered suggestive of a metastatic lesion.

Despite the recent intracranial hemorrhage and the extreme seriousness of the patient's general physical condition, it was decided that surgical exploration for a pheochromocytoma would offer the best chance for survival.

9 (a) Graham, J. B. Pheochromocytoma and Hypertension. An Analysis of 207 Cases. *Internat Abstr Surg* 82: 105-121. In *Surg Gynec & Obst.* (Feb.) 1951. (b) Colston, J. A. C. Surgical Aspects of Bilateral Familial Pheochromocytoma. *J Urol* 59: 1036-1060 (June) 1948.

Early on the morning of March 21, 1950, the patient had an other intracranial hemorrhage. He was then taken to the operating room in a completely unconscious condition. Because of the urographic evidence indicating a tumor in the right suprarenal region, this region was exposed through a right posterolateral incision. This procedure disclosed a tumor of the right suprarenal gland. The tumor was unusually large and was surrounded by numerous widely dilated veins. It was adherent to the kidney, and it was impossible to determine whether the kidney was actually invaded by the tumor. Because of the marked adherence of the tumor to the right kidney, the kidney was mobilized, and the tumor and the right kidney were removed together. The peritoneum was opened, and the left suprarenal region was palpated. A definite tumor could not be palpated in this region. At the conclusion of the operation on the right side, it was felt that the patient's condition would not permit any further surgical procedure. Therefore, the left suprarenal gland was not exposed.

Pathological examination revealed that a portion of the right suprarenal gland was stretched over the surface of the tumor, which was a poorly encapsulated pheochromocytoma (fig 1, 2,

Fig 1—Outer surface of the tumor showing the bosselated appearance and some of the many adhesions encountered

and 3). The tumor measured 12 by 10 by 6 cm and weighed 250 gm. The kidney itself weighed 140 gm.

On the morning of the day of operation, 20 cc of aqueous solution of adrenal cortex extract and 20 mg of piperoxan hydrochloride were administered intravenously in 1,000 cc of a 5% solution of dextrose. Owing to the loss of a considerable amount of blood, 2,500 cc of blood was transfused in the course of the operation. As soon as the tumor was removed, the intravenous administration of 1,000 cc of a 5% aqueous solution of dextrose containing 20 cc of aqueous solution of adrenal cortex extract and 15 cc of a 1:1,000 solution of epinephrine was started. The level of the blood pressure was controlled by regulating the rate of injection of this solution. The administration of this solution was continued during the immediate postoperative period.

Since the blood pressure began to rise again on the evening of the day of the operation, it was necessary to discontinue the administration of the epinephrine and to start the administration of piperoxan hydrochloride. In the course of this phase of rising blood pressure, the rectal temperature increased from 102 to 104 F, the pulse rate increased from 105 to 130 beats per minute, pulsus alterans developed, and the pupils became as small as pinpoints. Owing to the wide fluctuation of the blood pressure, which first necessitated the administration of epi-

nephrine and, subsequently, the administration of piperoxan hydrochloride, it was necessary for a physician to remain in constant attendance in order to regulate the dosage of the drugs. During a period of four hours, namely, from midnight to 4 a.m., it was necessary to administer intravenously 96 mg of piperoxan hydrochloride in 800 cc of a 5% solution of dextrose in isotonic sodium chloride solution.

Fig 2—Cut surface of the tumor showing a large central pale zone resulting from organization of a hematoma

The patient's physical condition remained satisfactory on the day after the operation. The blood pressure continued to drop, however, even after the administration of piperoxan hydrochloride was discontinued. In order to maintain the level of patient's blood pressure at 120 mm Hg systolic and 82 mm diastolic, it was necessary to administer intravenously 10 cc of aqueous solution of adrenal cortex extract and 6 cc of a 1:1,000 solution of epinephrine in 1,000 cc of a 5% solution of dex-

Fig 3—Large granular liver like cells are arranged in alveolar clusters. The very intimate relation of the tumor cells to large vascular sinusoids is ideal for the sudden release of vasopressor substances (hematoxylin and eosin stain $\times 227$)

trose. The administration of this solution was continued for two days. At the end of that time, treatment was discontinued, except for general supportive measures.

During the 24 hours of the sixth day after the operation, 0.45 mg of corticosteroids was excreted in the urine. The neurological symptoms had improved, and the only evidence of

aphasia was an occasional word block. The blood pressure remained stabilized at a level of 135 mm Hg systolic and 85 mm diastolic. Although hemiplegia still was present at that time, it improved gradually until on the 21st day after the operation the patient was able to walk without assistance. The intensity of the heart murmur was markedly diminished.

Physical therapy was applied to the paralytic limbs on the 20th day after the operation. This was increased gradually to include gait training and fine movements of the hand and fingers. Normal function ultimately returned.

On the 42nd day after the initial operation, a partial resection of the right seventh rib was performed in order to remove the lesion that had been noted previously in this region. The lesion proved to be a metastatic pheochromocytoma. After the second operation, repeated clinical tests, including the cold pressor test, the Roth Kvale histamine test, and the administration of piperoxan hydrochloride, did not disclose any evidence of a pheochromocytoma. When the patient was dismissed on the 50th day after the first operation, his general physical condition was good. At that time, his blood pressure was 120 mm Hg systolic and 80 mm diastolic.

When the patient returned to the clinic in September, 1950, his blood pressure was recorded as 155 mm Hg systolic and 110 mm diastolic. Examination did not reveal any residual hemiplegia, and clinical tests did not disclose any evidence of a pheochromocytoma. When he next was seen at the clinic on June 20, 1951, his blood pressure was recorded as 154 mm Hg

TABLE 2—Effect of Intramuscular Injection of Regitine on the Blood Pressure and Pulse Rate*

Minutes After Injection	Blood Pressure Mm Hg		Pulse Rate
	Systolic	Diastolic	
1	170	120	72
8	164	114	72
5	160	110	76
10	166	112	76
15	174	130	70
20	168	112	76

* Before the injection was started the blood pressure was 172 mm Hg systolic and 120 mm Hg diastolic and the pulse rate was 72.

systolic and 106 mm diastolic. When the cold pressor test was applied, the systolic pressure rose from 148 to 184 mm Hg, and the diastolic pressure rose from 95 to 136 mm Hg. The intravenous administration of 0.03 mg of histamine base caused the systolic pressure to rise from 150 to 160 mm Hg and caused the diastolic pressure to rise from 100 to 112 mm Hg. The effects of the intramuscular administration of 5 mg of Regitine on the blood pressure and pulse rate are shown in table 2. The results of these clinical tests were not considered indicative of a pheochromocytoma.

In a letter written Nov. 20, 1951, the patient's family physician said that the patient's blood pressure was 120 mm of mercury systolic and 80 diastolic, and that his pulse rate was 76.

When the patient returned to the clinic for another check up on May 30, 1952, his general physical condition was good and there was no objective evidence of a recurrence of the tumor. His blood pressure was 170 mm Hg systolic and 130 mm diastolic.

COMMENT

This case is an example of a malignant pheochromocytoma that produced sustained hypertension with marked fluctuations in the blood pressure. A single metastatic lesion was noted at the first examination. Removal of the primary tumor and a secondary metastatic lesion resulted in clinical improvement, which to date has persisted for more than two years. The value of the cooperative efforts of physiologist, internist, anesthesiologist, and surgeon in the management of a hemiplegic, stuporous patient with sustained hypertension caused by pheochromocytoma is well illustrated.

Since this patient was treated, we have had additional experience with similar patients, enabling us to improve our program of control of blood pressure before, during, and after operation. When anesthesia is to be induced, a needle is inserted into a vein. Connected to this needle is a three way stop-cock, which, in turn, is connected to (1) a syringe containing Regitine, (2) a syringe containing arterenol, and (3) a jar of 5% solution of dextrose-isotonic sodium chloride solution. Thus the blood pressure may be controlled before and during operation, when there may be extreme fluctuations in blood pressure. If, during induction of anesthesia or during operation, the blood pressure rises significantly, Regitine may be administered in sufficient quantity to neutralize circulating epinephrine and thus lower the blood pressure to the desired level. If, after the pheochromocytoma is removed, the blood pressure falls below safe levels, arterenol may be administered to raise the blood pressure to a desired level. If neither of these measures is necessary, the needle may be kept patent by allowing the dextrose or sodium chloride solution to be infused.

A critical period in the management of patients with pheochromocytoma is the first 24 to 48 hours after operation. At this time, the blood pressure usually falls to unsafe levels. Therefore, we administer continuously a solution of arterenol intravenously. The rate of infusion is regulated according to the quantity of arterenol necessary to maintain normal blood pressure. Because of the seriousness of this phase of the patient's recovery, a team of specially trained nurses are on 24 hour duty. Also, until the patient's blood pressure is stabilized, a physician remains with the patient to supervise the medical treatment.¹⁰

10 Hightower N C, Roth G M, and Priestley J T. Operative and Postoperative Control of Patients with Pheochromocytoma abstracted Proc Central Soc Clin Research 25:41 1952

Tonsillectomy—There was a time tonsillectomy was the most frequently performed of all operations in the United States. Fortunately that time has passed; however, there still are many patients, chiefly children and young adults, for whom tonsillectomy is indicated. When a young person has repeated bouts of tonsillitis with continuing evidences of chronic infection such as fever, leucocytosis, increased sedimentation rate, mild muscle and joint pains, cervical adenitis after the acute attack has subsided and vigorous antibiotic therapy has failed to clear up the infection, the indication for tonsillectomy seems clear. The tonsils of such persons will usually be found to be chronically inflamed, though not necessarily enlarged, with redness extending to the surrounding structures. Removal of such tonsils before rheumatic fever, rheumatoid arthritis, chronic infections of the urinary tract, subacute bacterial endocarditis, etc., develop is the most constructive thing to do. Improvement in these conditions from tonsillectomy after they have developed cannot always be expected, but it does seem rational to remove whatever active infection one can get at. It is hardly necessary to state that antibiotic therapy should precede operation for 24 hours and follow it for a few days. Of course, tonsillectomy should never be undertaken during the acute phase of rheumatic fever, however, in several instances when fever has continued several months after the joint pains and acute signs of carditis have subsided, we have seen the fever subside promptly after chronically diseased tonsils were removed.—P S Rhoads, M D, Joint Responsibility of the Otolaryngologist and the Internist in Removal of Focal Infection, *The Laryngoscope* March, 1953

MIDDLE LOBE SYNDROME PRODUCED BY FOREIGN BODY IN LOWER THIRD OF ESOPHAGUS

Major A R Valle

and

Lieut W A Cloutier (MC), U S Army

Much has been written recently about the etiology of the so-called middle lobe syndrome. From a review of the works published by Brock,¹ Zdansky,² Graham and co-workers,³ Paulson and Shaw,⁴ and others,⁵ there seems to be agreement that it is due in most cases to bronchial obstruction caused either by pressure from without or by narrowing of the lumen due to formation of chronic inflammatory tissue within. The commonest cause is pressure from without, usually due to enlargement of the peribronchial lymph nodes. As emphasized by Brock, the middle lobe bronchus lies at the apex of the lymphatic pathways from both the upper and lower lobes thus making it particularly vulnerable from the standpoint of lymphadenopathy. We present a case of atelectasis of the right middle lobe caused by the presence of a large foreign body in the lower third of the esophagus, to our knowledge the first of its type reported.

REPORT OF A CASE

A 25 year-old Negro man was admitted to the Thoracic Surgical Section of Tokyo Army Hospital on Sept 18, 1951. On Sept 11, while at the front in North Korea, this patient was blown out of his foxhole by an artillery fire blast. At that time his denture was broken in his mouth and he swallowed part of it. He experienced severe sharp pain progressing from the throat

down to the epigastric area and afterward was unable to swallow any liquid or solid food. He was first admitted to the 8076 Mobile Army Surgical Hospital and then evacuated to 121st Evacuation Hospital, where roentgenograms revealed the presence of the foreign body in the lower third of the

Fig 2—Postoperative films showing A, swallowed barium, and B, a complete resolution of the atelectasis of the right middle lobe (posteroanterior).

esophagus. On admission here, physical and x-ray examination of the chest showed the foreign body described above and an atelectasis of the right middle lobe (fig. 1). Esophagoscopy was not advised because of the size and shape of the metallic foreign body and the length of time that had elapsed since onset.

A right thoracotomy was performed through the usual posterolateral incision. The foreign body was felt in the lower third of the esophagus, in the wall of which were found several perforations. The swelling and edema in that area of the mediastinum extended to the region of the hilum of the middle and lower lobes. This area was dissected, and several large lymph nodes were found pressing on the right middle lobe bronchus but were not removed. A 5 cm longitudinal incision was made in the wall of the esophagus, and the denture was carefully removed. The defect was closed, and the mediastinum was left open into the pleural space (fig. 2). The right chest was drained by means of two stiff right angle rubber tubes, which were connected to low pressure suction and removed after 24 hours. The patient made an uneventful recovery and returned to duty six weeks after surgery. He was still doing well one year postoperatively.

COMMENT

This patient was operated on to relieve dysphagia and to remove the source of the mediastinitis. The atelectasis of the right middle lobe is thought to have been due to the pressure exerted on the right middle lobe bronchus by the enlarged lymph nodes and the edematous mediastinum. After surgery the mediastinum and lymph nodes returned to normal, and on the fourth postoperative day the right middle lobe atelectasis began to clear and had completely disappeared within two weeks. This would seem to bear out the conclusion of other authors that the middle lobe syndrome is due to obstruction of the middle lobe bronchus caused by extrinsic pressure exerted by enlarged peribronchial lymph nodes or narrowing of the lumen of the bronchus by chronically inflamed tissue.

SUMMARY

The literature regarding the etiology of so-called middle lobe syndrome is reviewed and a case presented of such a syndrome produced by the presence of a denture in the lower third of the esophagus. The denture was removed through a right thoracotomy, and the atelectasis cleared. To our knowledge, this is the first case of its kind reported in the literature.

Fig 1—Atelectasis of the right middle lobe. A, the denture can be seen at the lower third of the esophagus. B, the lateral view shows the denture and the atelectasis.

SEBACEOUS CYSTS

CORRELATION OF CLINICAL AND PATHOLOGICAL DIAGNOSES IN THREE HUNDRED CASES

Stanley Gross, M D, New York

The sebaceous cyst is a common lesion and in the vast majority of cases is regarded as a benign and harmless one. These growths are often disregarded, but when they cause the patient to seek medical advice they are frequently excised. In this study, an attempt has been made to correlate the clinical diagnosis of sebaceous cyst with the final pathological diagnosis. Most of these cases were designated sebaceous cysts by the clinicians, but a wide variety of terms, including steatoma, wen, pseudoatheroma, and epidermoid inclusion cyst, was used on occasion. All cases were included, regardless of exact terminology, if it could be ascertained that the clinician meant the lesion commonly called sebaceous cyst.

The last 6,600 surgical specimens examined at the University Hospital of the New York University-Bellevue Medical Center were reviewed, and in 300 instances a clinical diagnosis of sebaceous cyst of the skin was made. Of these, 248 cases were, in fact, sebaceous cysts, an incidence of 3.8%, after final histological study. The correct diagnosis was made, therefore, in 82.7% of the cases. In 52, or 17.3% of the cases, the clinical diagnosis was incorrect, and pathological study revealed an entirely different lesion.

Analysis of the 52 cases (see table) in which an incorrect clinical diagnosis was made revealed a wide variety of lesions. In this series 24 separate and distinct pathological diagnoses were made on lesions erroneously called sebaceous cysts clinically. The commonest lesions confused with the sebaceous cyst were lipomas (7 cases), fibromas (5 cases), inflammation of the skin and subcutis (5 cases), sclerosing hemangiomas (4 cases), and pigmented nevi (4 cases). These are all rather common lesions of the skin and subcutis and may simulate the sebaceous cyst in consistency, appearance, and circumscription. The majority of the remaining lesions were rarer and are usually considered only in an extended list of differential diagnoses of tumors of the skin and subcutis, however, some are malignant, and therefore utmost care must be exercised to see that the primary lesion is adequately excised. To this end adequate sections must be prepared and examined not only to arrive at a diagnosis but also to determine whether the lesion has been entirely removed.

It is of some interest to note the changes that were seen in the sebaceous cysts examined. In 43 cases there was a moderately severe associated inflammatory reaction. In a few cases abscess formation was noted, but usually there was rupture of the cyst and a granulomatous reaction was found in the surrounding tissues. Often keratin spilled out and a foreign body reaction associated with multinucleated giant cells was evoked. Occasionally the epithelial lining was disrupted and patches of squamous epithelium were scattered in the inflammatory reaction. This haphazard arrangement of broken cyst wall must not be confused with squamous cell carcinoma

Carcinoma arising in a sebaceous cyst must be an unusual and rare occurrence. In this series no case of carcinoma arising in a sebaceous cyst was found. Three cases of carcinoma and two cases of atypical epithelial hyperplasia in the walls of sebaceous cysts have been seen in the last 12 years in the surgical cases at the University Hospital. Ormsby¹ states that the "rare occurrence of malignant change arising in elderly people is to be remembered." This is at complete variance with Herbut,² Eller and Eller,³ and Caylor,⁴ who cite an incidence of up to 4% of carcinomas arising in sebaceous cysts. The photograph reproduced in Eller's book suggests rupture of a sebaceous cyst with granulomatous foreign body reaction rather than carcinoma.

The pathological examination of these lesions, therefore, is extremely important. Since the correct diagnosis was not made in a fairly high proportion of cases (17.3%)

MIDDLE LOBE SYNDROME PRODUCED BY FOREIGN BODY IN LOWER THIRD OF ESOPHAGUS

Major A R Valle

and

Lieut W A Cloutier (MC), U S Army

Much has been written recently about the etiology of the so-called middle lobe syndrome. From a review of the works published by Brock,¹ Zdansky,² Graham and co-workers,³ Paulson and Shaw,⁴ and others,⁵ there seems to be agreement that it is due in most cases to bronchial obstruction caused either by pressure from without or by narrowing of the lumen due to formation of chronic inflammatory tissue within. The commonest cause is pressure from without, usually due to enlargement of the peribronchial lymph nodes. As emphasized by Brock, the middle lobe bronchus lies at the apex of the lymphatic pathways from both the upper and lower lobes thus making it particularly vulnerable from the standpoint of lymphadenopathy. We present a case of atelectasis of the right middle lobe caused by the presence of a large foreign body in the lower third of the esophagus, to our knowledge the first of its type reported.

REPORT OF A CASE

A 25-year old Negro man was admitted to the Thoracic Surgical Section of Tokyo Army Hospital on Sept 18, 1951. On Sept 11, while at the front in North Korea, this patient was blown out of his foxhole by an artillery fire blast. At that time his denture was broken in his mouth and he swallowed part of it. He experienced severe sharp pain progressing from the throat

Fig 1—Atelectasis of the right middle lobe. A the denture can be seen at the lower third of the esophagus. B the lateral view shows the denture and the atelectasis.

down to the epigastric area and afterward was unable to swallow any liquid or solid food. He was first admitted to the 8076 Mobile Army Surgical Hospital and then evacuated to 121st Evacuation Hospital, where roentgenograms revealed the presence of the foreign body in the lower third of the

Fig 2—Postoperative films showing A swallowed barium, and B a complete resolution of the atelectasis of the right middle lobe (posteroanterior).

esophagus. On admission here, physical and x-ray examination of the chest showed the foreign body described above and an atelectasis of the right middle lobe (fig. 1). Esophagoscopy was not advised because of the size and shape of the metallic foreign body and the length of time that had elapsed since onset.

A right thoracotomy was performed through the usual posterolateral incision. The foreign body was felt in the lower third of the esophagus, in the wall of which were found several perforations. The swelling and edema in that area of the mediastinum extended to the region of the hilum of the middle and lower lobes. This area was dissected, and several large lymph nodes were found pressing on the right middle lobe bronchus but were not removed. A 5 cm longitudinal incision was made in the wall of the esophagus, and the denture was carefully removed. The defect was closed, and the mediastinum was left open into the pleural space (fig. 2). The right chest was drained by means of two stiff right angle rubber tubes, which were connected to low pressure suction and removed after 24 hours. The patient made an uneventful recovery and returned to duty six weeks after surgery. He was still doing well one year postoperatively.

COMMENT

This patient was operated on to relieve dysphagia and to remove the source of the mediastinitis. The atelectasis of the right middle lobe is thought to have been due to the pressure exerted on the right middle lobe bronchus by the enlarged lymph nodes and the edematous mediastinum. After surgery the mediastinum and lymph nodes returned to normal, and on the fourth postoperative day the right middle lobe atelectasis began to clear and had completely disappeared within two weeks. This would seem to bear out the conclusion of other authors that the middle lobe syndrome is due to obstruction of the middle lobe bronchus caused by extrinsic pressure exerted by enlarged peribronchial lymph nodes or narrowing of the lumen of the bronchus by chronically inflamed tissue.

SUMMARY

The literature regarding the etiology of so-called middle lobe syndrome is reviewed and a case presented of such a syndrome produced by the presence of a denture in the lower third of the esophagus. The denture was removed through a right thoracotomy, and the atelectasis cleared. To our knowledge, this is the first case of its kind reported in the literature.

SEBACEOUS CYSTS

CORRELATION OF CLINICAL AND PATHOLOGICAL DIAGNOSES IN THREE HUNDRED CASES

Stanley Gross, M D, New York

The sebaceous cyst is a common lesion and in the vast majority of cases is regarded as a benign and harmless one. These growths are often disregarded, but when they cause the patient to seek medical advice they are frequently excised. In this study, an attempt has been made to correlate the clinical diagnosis of sebaceous cyst with the final pathological diagnosis. Most of these cases were designated sebaceous cysts by the clinicians, but a wide variety of terms, including steatoma, wen, pseudoatheroma, and epidermoid inclusion cyst, was used on occasion. All cases were included, regardless of exact terminology, if it could be ascertained that the clinician meant the lesion commonly called sebaceous cyst.

The last 6,600 surgical specimens examined at the University Hospital of the New York University-Bellevue Medical Center were reviewed, and in 300 instances a clinical diagnosis of sebaceous cyst of the skin was made. Of these, 248 cases were, in fact, sebaceous cysts, an incidence of 3.8%, after final histological study. The correct diagnosis was made, therefore, in 82.7% of the cases. In 52, or 17.3% of the cases, the clinical diagnosis was incorrect, and pathological study revealed an entirely different lesion.

Analysis of the 52 cases (see table) in which an incorrect clinical diagnosis was made revealed a wide variety of lesions. In this series 24 separate and distinct pathological diagnoses were made on lesions erroneously called sebaceous cysts clinically. The commonest lesions confused with the sebaceous cyst were lipomas (7 cases), fibromas (5 cases), inflammation of the skin and subcutis (5 cases), sclerosing hemangiomas (4 cases), and pigmented nevi (4 cases). These are all rather common lesions of the skin and subcutis and may simulate the sebaceous cyst in consistency, appearance, and circumscription. The majority of the remaining lesions were rarer and are usually considered only in an extended list of differential diagnoses of tumors of the skin and subcutis, however, some are malignant, and therefore utmost care must be exercised to see that the primary lesion is adequately excised. To this end adequate sections must be prepared and examined not only to arrive at a diagnosis but also to determine whether the lesion has been entirely removed.

It is of some interest to note the changes that were seen in the sebaceous cysts examined. In 43 cases there was a moderately severe associated inflammatory reaction. In a few cases abscess formation was noted, but usually there was rupture of the cyst and a granulomatous reaction was found in the surrounding tissues. Often keratin spilled out and a foreign body reaction associated with multinucleated giant cells was evoked. Occasionally the epithelial lining was disrupted and patches of squamous epithelium were scattered in the inflammatory reaction. This haphazard arrangement of broken cyst wall must not be confused with squamous cell carcinoma

Carcinoma arising in a sebaceous cyst must be an unusual and rare occurrence. In this series no case of carcinoma arising in a sebaceous cyst was found. Three cases of carcinoma and two cases of atypical epithelial hyperplasia in the walls of sebaceous cysts have been seen in the last 12 years in the surgical cases at the University Hospital. Ormsby¹ states that the "rare occurrence of malignant change arising in elderly people is to be remembered." This is at complete variance with Herbut,² Eller and Eller,³ and Caylor,⁴ who cite an incidence of up to 4% of carcinomas arising in sebaceous cysts. The photograph reproduced in Eller's book suggests rupture of a sebaceous cyst with granulomatous foreign body reaction rather than carcinoma.

The pathological examination of these lesions, therefore, is extremely important. Since the correct diagnosis was not made in a fairly high proportion of cases (17.3%)

SIMPLE RECEPTACLE FOR T-TUBE DRAINAGE

James R. Watson, M.D., Pittsburgh

Any system that provides for drainage of the common bile duct consists of two essential parts, a catheter or T-tube to be placed in the duct and a receptacle for collecting the bile, which is attached to the dressing on the abdominal wall. I have used a number of devices for the

Receptacle for T tube drainage in use

receptacle, none of which have ever been completely satisfactory to either the patients or the attending nurses. Any unexpected change in position on the part of the patient would be apt to cause spillage of bile on the dressing and the bed.

Recently, after having inserted a T-tube in the common duct of an obese patient and having applied the dressing, I was confronted with a T-tube that was too short to reach the 8 oz (250 cc) pharmacy bottle and nipple that I usually used for the receptacle. The nursing supervisor, Miss Catherine Marburger, speedily remedied the problem by obtaining a secondary Venopak unit (a disposable venoclysis unit for intravenous administration of fluids [Abbott]). The unit consisted of a length of plastic tubing with an adapter that fit the T-tube perfectly. The other end of the tubing had a screw cap attached to it that contained an air vent. The thought immediately occurred to use a 250 cc intravenous solution bottle that the cap

had been made to fit. Adhesive tape was applied to the bottom and sides of the bottle to serve as a sling, which was pinned to the dressing. A scultetus binder was placed over the dressing and the excess tubing coiled beneath it.

There has been no spillage problem since I have used this method. It represents the best device with which I have had any experience (figure). It has the following advantages: 1. The secondary unit and bottle are readily available at negligible cost. 2. The unit is packaged in a sterile container ready for immediate use. 3. There is no spillage of bile on the bed or dressing. 4. The bottle is calibrated by the manufacture to 250 cc, which permits accurate measurement of the amount of drainage. 5. The bottle is easily removed and replaced when it needs to be emptied.

ISOLATION OF COXSACKIE VIRUS FROM PATIENTS WITH EPIDEMIC PLEURODYNIA

Óskar T. Thordarson, M.D.

Bjorn Sigurdsson, M.D.

and

Halldór Grimsson, fil. mag., Reykjavik, Iceland

Epidemic myalgia, or pleurodynia, was probably first observed as a clinical entity by the Icelandic physician Jón Finsen.¹ In 1874 he described two epidemics of the disease, one of them occurring in 1856 and the other in 1866. Finsen called the disease pleurodynia. Since 1928 the disease has annually figured in the Icelandic health reports.

Several authors have recently reported the successful isolation of strains of the so-called Coxsackie viruses in cases of epidemic pleurodynia.² These observations stimulated us to search for this type of virus in an epidemic that occurred in Reykjavik, in 1951. In the period from April to August, 1951, 225 cases of epidemic pleurodynia were registered in Reykjavik, a town of 57,500 inhabitants. The morbidity thus amounted to about 0.5%. In this period no cases of anterior acute poliomyelitis or aseptic meningitis were reported. The main symptoms and signs in these patients were as follows: no prodromes and a sudden beginning in 8, thoracic pain in 14, abdominal pain in 7, pain in the extremities in 4, headache in 3, sore throat in 2, cuffing in 2, fever (temperatures of 37.5 [99.5 F] to 40 C [104 F]) for one to

six days in 13,³ severe illness in 2, muscle tenderness in 8, signs of pleurisy in 1, hyperemic pharynx in 5, and bronchitis in 1

The following methods were employed for isolating and identifying the virus. 1 Extracts of stool were prepared and injected intraperitoneally into suckling mice, less than 48 hours old. 2 A histological examination was performed on animals that became paralyzed. 3 Neutralizing antibodies against one of the virus strains isolated were measured in paired serums from the patients. Samples of stools and serum were collected from the patients as soon as the diagnosis was considered certain. In 13 patients this was from 1 to 4 days after they became ill, and in 2 it was 6 and 10 days, respectively, after the disease began. The patients were bled for the second time about three weeks after the first bleeding. Feces and serum were frozen immediately after collection and kept at -22 C until used. In preparation for injection the stool suspension was first centrifuged several times at low speed to remove coarse particles and bacteria. After this it was

run in the Spinco ultracentrifuge, rotor F, at 29,500 rpm (73,000 times the force of gravity) for two and one-half hours, so that sediment was deposited in the virus. It was resuspended in a small volume used for inoculation. To this extract were added penicillin and streptomycin in sufficient quantity so that the extract contained 2,000 units of penicillin and 10 mg of streptomycin per milliliter. Of this extract, 0.05 ml were injected intraperitoneally into suckling mice. Mice dying less than 48 hours after the injection were discarded. Paralysis and specific deaths occurred on the 3rd to the 12th day, usually on the 7th to the 9th day. When paralysis occurred, it was usually very distinct and most commonly affected the hind legs. Only animals with distinct paralysis were used for passing virus and for histological work. Material from the first passage was passed on to other suckling mice. The skin and the viscera were removed and the remaining carcass suspended in the Waring Blender, diluted, and injected

Table 1 shows the results of our attempts to isolate Cocksackie virus from the 15 patients. It will be seen that a virus producing paralysis was isolated in 9 cases out of 15. A histological examination was carried out on the experimental animals in whom changes occurred due to the virus. The muscles were examined in all cases, and the liver and brain in several of the animals. The histological changes were generally very conspicuous, and in every case they were of the same type as has repeatedly been described for Cocksackie virus infections. Four of the virus strains isolated were injected into a number of adult mice and proved to be nonpathogenic.

Paired serums from seven patients were tested for the presence of neutralizing antibodies against one of our newly isolated strains. Three dilutions of serum, 1:10, 1:50, and 1:250, were tested against 100 minimal lethal doses of virus. The results of this neutralization test may be seen in table 2. It will be seen that in five of the seven patients examined a significant rise in antibody titer against this virus strain was observed. In the remaining two cases a rise in antibody titer against the strain used was not found. Virus had been isolated from one of these two patients, but this strain has not been subjected to an

immunologic examination. Possibly it may differ from the strain used in the neutralization test. From the neutralization test, however, it may be concluded that at least six of the patients in whom virus was found have gone through an infection with a similar or an identical strain of virus. These investigations have not been carried further because of lack of time, and for the same reason no attempt has been made to classify immunologically the strains isolated.

SUMMARY

A widespread epidemic of epidemic pleurodynia occurred in Reykjavik from April to August, 1951. An account was given of the main symptoms observed in the patients in this epidemic. Fifteen patients with epidemic pleurodynia were examined for the presence of Cocksackie virus in their stools. Such virus was isolated from 9 of the 15 patients tested. Neutralization tests on paired serums from seven patients indicated that at least six of the patients had gone through an infection with a similar or an identical type of virus. We conclude that these experiments lend support to the view that epidemic pleurodynia is caused by viruses of the Cocksackie group.

³ In one case the temperature was not taken. One other patient had a normal temperature.

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

The Council has authorized publication of the following report submitted to the Committee on Research

R T STORMONT, M D, Secretary

In some instances, dangerous side-reactions to highly potent therapeutic agents constitute a more serious threat to the life of the patient than the disease for which the patient is being treated. The hypoplastic anemias that aroused considerable attention recently are a case in point.

The following report to the Committee on Research was prepared at the request of the Committee and represents the first step in a further investigation of the causes and incidence of the hypoplastic anemias in the United States. A Sub-committee on Blood Dyscrasias has been appointed and will soon meet to formulate a plan of study and protocols for analysis of cases of hypoplastic anemia.

The matter of earlier reporting of all drug reactions, including the hypoplastic anemias, was discussed at the annual meetings of the Committee on Research and the Council on Pharmacy and Chemistry. It was felt that information on the potential dangers of therapeutic agents should be called to the attention of the profession at the earliest opportunity. To accomplish this purpose the Committee on Research was authorized to take measures for the collection of available data on the hazards, reactions, and results in connection with treatment utilizing new procedures and drugs and to inform the practicing physicians of the existence of this agency for collecting such data. The Committee on Research was urged to compile these data into reports to be submitted from time to time for publication in THE JOURNAL.

Physicians are urged to report immediately all incidents of untoward drug reactions especially with newer therapeutic agents, to the undersigned at the A M A Headquarters and to the Food and Drug Administration in Washington.

PAUL L WERMER, M D, Secretary,
Committee on Research

HYPOPLASTIC ANEMIAS AND RELATED SYNDROMES CAUSED BY DRUG IDIOSYNCRASY

Edwin E Osgood, M.D., Portland, Ore

Hypoplastic anemia is essentially the simultaneous occurrence of erythrocytic, granulocytic and thrombocytic hypoplasia. These conditions may occur separately or in any combination. An absolute decrease in the lymphocytic series of cells is often associated, although they are relatively less affected as a rule. Agents that produce one of these syndromes will often produce two or more of these syndromes simultaneously in different persons or in larger doses.

DIAGNOSIS

Pure erythrocytic hypoplasia is characterized by normocytic anemia with a decrease in reticulocytes in the blood to few or none and a great decrease in the number of nucleated erythrocytes in the aspirated marrow.

Granulocytic hypoplasia is characterized by a decrease in the absolute number of cells of the granulocytic series in the peripheral blood and also a great decrease in the number of these cells in the aspirated bone marrow. When the total number of neutrophils in the blood falls below 200 per cubic millimeter, invasions of the mucous membranes of the body by micro-organisms usually follow. These are usually mixed infections with many different organisms, but *Borrelia vincenti* (Vincent's organisms) often predominate. Soreness and membranous ulceration of the gums are usually the first mani-

festation, but any mucous membrane in the body and the alveoli of the lungs may also be invaded. If the infection remains untreated, it may cause death in a very short time.

Thrombocytic hypoplasia is characterized by decreased thrombocytes in the blood and decreased nucleated cells of the thrombocytic series in the marrow. The clinical features are spontaneous petechial and purpuric spots scattered over the body, ecchymoses rather than hematomas from trauma, spontaneous bleeding from the gums, and menorrhagia. Cerebral hemorrhage is the common cause of death.

The most reliable laboratory test of thrombocyte function is the clot retraction test. Serious bleeding rarely occurs when clot retraction begins within one hour and is complete in 18 to 24 hours, but serious bleeding is an imminent danger when clot retraction fails to occur. The thrombocyte count, as done in the average clinical laboratory, is almost worthless as a guide to therapy even skilled hematologists find that one in 20 replicate thrombocyte counts will fall outside a range of $\pm 50\%$ of the mean of a large number of counts. Other indications of deficient thrombocyte function are a bleeding time over eight minutes, a positive petechiometer (capillary fragility) test, and scarce or total lack of thrombocytes as observed in stained blood smears.

Hypoplastic anemia exhibits all of the aforementioned features combined. Because of the difference in life spans of these cells (24 to 96 hours for thrombocytes, 72 to 144 hours for the granulocytic series of cells, and 120 days for the erythrocytic series), the thrombocytopenia and granulocytopenia usually long precede the anemia, but the decrease in reticulocytes and in nucleated erythrocytes (life span of 36 to 48 hours each) occurs early, as does the hypocellularity in the bone marrow. A total nucleated cell count of aspirated bone marrow under 10,000 per cubic millimeter is suggestive, whereas a count under 6,000 is diagnostic if no cells characteristic of aleukemic leukemia are present in the aspirate.

The drug induced hypoplastic syndromes differ from other hypoplastic syndromes in that the disease develops in only a small proportion of the population exposed to risk, and the severity of the hypoplasia shows little relationship to the dose administered. In other words, there is a difference or idiosyncrasy to the particular drug in the response of the person affected. Evidence suggests that these untoward reactions occur more commonly in persons with a history of allergy and on a second or an intermittent course of treatment than with the first administration of the agent. However, cases have occurred in persons with no history of allergy after the first administration of small doses well within the range of those tolerated by the great majority of persons.

The mechanism of this idiosyncrasy is unknown. In my opinion, the known facts are best explained if the drug or one of its metabolites, in susceptible persons, combines with an essential protein of the cell to form a new protein that causes development of antibodies, however, conclusive proof of existence of this mechanism is not available.

The drugs that are known to have produced this type of hypoplastic syndrome are listed in table 1. Therefore, it is especially important to elicit a history of the exact amounts taken and time relationship to onset of symptoms for all drugs the patient received during the four to eight weeks immediately preceding the onset of symptoms or signs of these hypoplastic syndromes. The patient should be questioned specifically about exposure to any of the drugs listed in table 1. Since many of these agents are sold under proprietary names or in trade named mixtures, the list given is incomplete. New preparations are constantly appearing, and an adequate drug history may also involve reading the fine print on original packages at the pharmacy where medication was obtained.

DIFFERENTIAL DIAGNOSIS

These drug idiosyncrasy hypoplasias must be differentiated from hypoplasias of other etiology. The mild hypoplasias (all common) that are associated with certain bacterial, viral, or parasitic infections and with hypothyroidism or with protein deficient diets are usually easily recognized, as is the erythrocytic hypoplasia associated with impairment of renal function. An enlarged spleen will differentiate between the moderately severe hypoplasias associated with the various conditions pro-

ducing portal hypertension and congestive splenomegaly, and drug induced hypoplasias The rare cases of congenital erythrocytic hypoplasia and congenital hypoplastic anemia (Fanconi's syndrome) date from birth whereas the drug induced hypoplasias do not The preceding history, physical examination, and laboratory findings of a patient will reveal the difference between drug induced hypoplasia and the rare hypoplasia

TABLE 1—Classification of Drugs That May Produce an Idiosyncrasy Causing Hypoplastic Anemia or Related Syndromes

Classification	Estimated Relative Risk †
Anticonvulsants	
Methyl phenyl-ethyl hydantoin (Mesantoin)	High
Trimethadione (Tridione)	Moderate
Antihistamines *	
Phenothiazine type (Phenergan)	Moderate
Ethylene diamine type (Pyribenzamine hydrochloride)	Low
Antimicrobial agents	
Arsenobenzols	High
Chloramphenicol (Chloromycetin)	High
Sulfonamides	Moderate
Thiosemicarbazone * (Tibione)	Moderate
Streptomycin	Low
Antithyroid agents	
Thiouracils *	High
Methimazole (Tapazole)	Moderate
Sedatives	
Allylisopropylacetyleurea † (Sedormid)	High
Amibopyrine * (Pyramidon)	High
Phenacemide (Phenurone)	Moderate
Pyrithyldione (Presidion)	Low
Spasmolytics	
Phenothiazines * (Dipareol)	Moderate
Procaine amide * (Pronestyl) hydrochloride	Low
Unclassified group	
Gold preparations	High
Phenylbutazone (Butazolidin)	High
Nitrophenols *	High
Mercurial diuretics	Low
Quinidine †	Low
Quinacrine hydrochloride (Atabrine dihydrochloride)	Low

* Chiefly granulocytic hypoplasia
† Chiefly thrombocytic hypoplasia
‡ Based on proportion of persons receiving drug in whom one of these hypoplastic syndromes is likely to develop. No adequate data are available except for quinacrine for which risk is approximately 1 in 25,000 patient years of exposure

caused by complete myelofibrosis or osteopetrosis or the very rare hypoplasia that constitutes the terminal phase of an occasional patient with lymphocytic leukemia The history of exposure to x rays, radioactive isotopes nitrogen mustards, urethane, dimethyl 1,4-butanedisulfate (Myleran), 6 mercaptopurine, or antifolic acid compounds such as aminopterin, or of occupational exposure to benzol will differentiate the group of cases caused by these agents (all produce hypoplasia in anyone if the dose is large enough) from the drug idiosyncrasy group of hypoplasias There are also idiopathic forms of hypoplasia resulting from an unknown cause, in which the most careful history fails to reveal an agent that might possibly be responsible

The initial occurrence in hypoplasia seems to be prolongation of the intermitotic interval or complete cessation of cell division in the marrow, however, some cases of hypoplasia result from actual destruction of marrow cells The predominant cells remaining in the marrow belong to the plasmocytic, lymphocytic, and histiocytic series but prolonged search will nearly always reveal a few cells of the involved series Therefore, complete aplasia almost never occurs

When cell division begins again, only immature cells are first produced, this predominance of immature cells must not be confused with acute leukemia, which may give every clinical and laboratory sign of hypoplastic anemia The involved cells in acute leukemias have larger nucleoli than their normal counterparts In acute leukemia lymph nodes and the spleen are usually enlarged, and usually the total nucleated cell count of the marrow is over 10,000 per cubic millimeter Enlargement of the spleen and lymph nodes does not occur in the hypoplastic syndromes under consideration except as a focal enlargement in an area draining localized infection The great majority of patients with pancytopenia will prove to have acute aleukemic or subleukemic leukemias if thin smears of the buffy coat of the blood and aspirated marrow are carefully studied for increased numbers of disintegrated cells and blast and

'pro' cell forms with large nucleoli Idiopathic and allergic thrombocytopenic purpuras are differentiated by the normal or increased numbers of megakaryocytes in the marrow

THERAPY

The majority of the cases reported would not have occurred if the risk of the disease had been weighed against the risk of the drug employed For a minor ailment that is almost certain to improve with a safer therapy or only supportive measures, it would certainly seem inadvisable to prescribe a drug that has been known to cause death Any patient who is ill enough to require therapy with such a drug (even though death occurred in only a very small percentage of patients) is certainly ill enough to justify an initial determination of hemoglobin concentration, leukocyte count, reticulocyte count, and clot retraction time These tests should serve as a basis for comparison with subsequent hematological studies after therapy has been started Patients should be told when any drug listed in table 1 is prescribed that the physician should be consulted immediately if soreness of the gums, bleeding from the gums or into the skin, extreme weakness, or pallor develop so that the aforementioned tests can be repeated daily Ideally, these tests should be repeated at least once a week both during the early stages of treatment with any agent listed in table 1, and at the termination of therapy

If any of these tests indicates mild hypoplasia (the range is shown in table 2) it should be repeated daily, any progressive decrease or indication of moderate or severe hypoplasia requires immediate cessation of administration of any drug listed in table 1 or any compounds closely related chemically The patient should be given a card worded as follows John Doe has an idiosyncrasy to (name of drug or compound) that led to the development of (type of hypoplasia) Under no circumstances should he ever again receive this compound or any closely related compounds The patient should be given explicit instructions to keep the card on his person and to show or read this card to any physician he might consult in the future The same information should be included in large print on the front page of his office and hospital records The importance of this procedure cannot be overemphasized Many patients, having recovered from initial attacks of drug induced hypoplasia, have died from subsequent attacks that would never have occurred had this precaution been observed

Patients with moderate asymptomatic granulocytic hypoplasia should receive a daily dosage of 300,000 units of procaine penicillin with 0.5 gm of streptomycin, given intramuscularly For severe hypoplasia or symptomatic hypoplasia,

TABLE 2—Grades of Hypoplastic Syndromes

Test	Mild	Moderate	Severe
Absolute number of neutrophils per cubic millimeter (WBC times %)	500-1500	200-500	< 200
Clot retraction *	Delayed or incomplete	Absent 1 hr	Absent 18 hr
Reticulocytes % †	0.3-0.5	0.1-0.3	< 0.1

* See J. A. M. A 150 1197 (Nov 22) 1952, fig 7 for a good photograph showing incomplete and absent clot retraction Observe rack of blood serology tubes for range of normal clot retraction

† Mix five drops of blood with five drops of freshly filtered 1% brilliant cresyl blue in isotonic sodium chloride solution in a small test tube Let stand 15 minutes and make thin smear Count at least 20 reticulocytes or 200 fields The Miller eyepiece disk (Brecher G A and Schneiderman M Time-Saving Device for Counting of Reticulocytes Am J Clin Path. 20 1079 [Nov 1] 1950) saves time on low counts If the reticulocyte count is low aspirate 0.5 to 2 ml of marrow Mix thoroughly with 2 mg of dry potassium oxalate per ml in small test tube Do total nucleated cell count by technique of leukocyte counting Do differential count of 500 cells on thin Wright's stained smear Total nucleated cell count times % of all types of nucleated erythrocytes is absolute number of nucleated erythrocytes per cu mm Values corresponding to mild moderate and severe erythrocytic hypoplasia are 2 000 to 4 000 500 to 2 000 and < 500 respectively

this therapy should be given twice daily, and supplemented in 48 hours with 500,000 units of penicillin G, given intramuscularly, twice daily if symptoms have not dramatically improved The dose of penicillin G should be doubled every 48 hours until rapid improvement is apparent This dose should be maintained until at least one week after complete healing of ulcerations and disappearance of all evidence of infection

The prophylactic dose should be continued until a definite upward trend of the neutrophils in the mild hypoplasia range is evident

The only effective therapy for thrombocytic hypoplasia is fresh (not over six hours old) blood transfusions given every six hours until clot retraction begins in one hour. Transfusions should be repeated as often as necessary to maintain some clot retraction. In severe cases this may involve daily transfusions for long periods of time. Blood from patients with high thrombocyte counts, such as occur in polycythemia vera, is advantageous when available. If plethora or erythrocytosis develops because of the much longer life span of the erythrocytes, the transfusions may be preceded by withdrawal of a volume of blood equal to that to be administered. Negligible numbers of thrombocytes are removed by such a procedure because of their short life span. The various methods of concentrating thrombocytes are as yet not very practical in any but the largest urban centers. Clot retraction tests must be repeated daily to control adequately this type of therapy.

Great care should be exercised to preserve veins by skillful venipunctures, rather than by cutting down on the vein if it can possibly be avoided, since the need for frequent transfusions may persist for many months. When venipuncture is impossible, blood can always be given through a marrow aspiration needle inserted into the marrow cavity 1 cm below the iliac crest, with the patient lying on the opposite side. Time, money, and veins should not be wasted by giving calcium or vitamin K preparations. The latter are of value only in patients with hypoproliferative anemia of less than 50% of normal, and no known bleeding tendency is benefited by calcium therapy. Extreme care should be used in the typing and crossmatching of blood in these patients who will usually need many transfusions. An Rh negative patient must not receive Rh positive blood. If intracranial bleeding or serious bleeding elsewhere begins, it is probably justifiable to give blood before the usual serologic tests for syphilis have been completed, for should they be positive, adequate penicillin therapy can be given, and the risk of fatal hemorrhage is far greater than the risk from possible transmission of syphilis. Every minute counts under such circumstances. Erythrocytic hypoplasia occurring alone is usually readily controlled by one transfusion every week or 10 days.

These measures are the only ones of proved value in treatment of these syndromes. If the patients can be kept alive long enough, spontaneous recovery will usually occur. The severer the marrow damage, the longer this may require. Sometimes it is a matter of many months or even several years. Patients with milder forms may recover in the course of a few days or weeks.

A trial of cortisone or corticotropin therapy may be justifiable, but sufficient evidence is not available to establish its value.

Cobalt chloride, 50 mg, three times daily after meals, prepared from the chemically pure reagent in aqueous solution, has proved effective in other types of erythrocytic hypoplasia.

There is no statistically sound evidence that pentnucleotide or yellow bone marrow has accomplished anything in these diseases, their intramuscular injection leads to additional portals of entry and sites of lowered resistance to infection.

SUMMARY

Some risk of drug induced hypoplasia is unavoidable. Drugs that are known to carry a greater risk than the disease for which they are given should never be administered. Simple tests are available that will detect the syndromes. According to present knowledge, recovery depends on prompt recognition of the hypoplasia, immediate discontinuance of the causal agent, precautions to prevent its ever being given again to the same person, and use of the known effective measures in controlling infection, bleeding, and anemia until spontaneous cell division begins again in the marrow.

Much remains to be learned about the relative risks of the different agents, the mechanism of production of these diseases, and their proper therapy. Accurate and complete reporting of all such cases to the Council on Pharmacy and Chemistry of the American Medical Association will greatly facilitate the accumulation of such knowledge.

REPORT TO THE COUNCIL

The Council has authorized publication of the following report from the Committee on Pesticides

R. T. STORMONT, M.D., Secretary

The selection and establishment of nonproprietary names for chemicals is a little-known and often unappreciated task undertaken by certain groups in this country and abroad. Substantial gains in simplifying the naming of drugs and pesticides have been made, but these have been accomplished with difficulty. Many of the problems which still beset nomenclature groups stem from a lack of understanding of the value of such names to the public and to the professions.

The Committee feels that a review of the history of this practice, which concerns the value and significance of generic names for chemicals and current problems particularly as they relate to pesticide nomenclature, has long been overdue. The following report which is the tenth in a series of published statements by the Committee on Pesticides, has been prepared for this purpose. Information on previous reports may be obtained from the Committee office.

BERNARD E. CONLEY, Secretary,
Committee on Pesticides

USE AND ABUSE OF GENERIC (COINED COMMON) NAMES FOR PESTICIDES

One of the major impediments in the advancement of scientific knowledge is the confusion resulting from the multitude of names that exist for a particular chemical. A compound that has become familiar to the public may be identified by a chemical name, a common or generic name, an official name, trade, brand or proprietary names, or a popular or nonproprietary synonym. The growing number of compounds and the variety of their designations are overwhelming to all but those with sufficient time and compelling interest to keep abreast of current terminology.

Certain names are justified, and each type of nomenclature has its own strong adherents. For example, many believe that chemical names make unmistakably clear the structure and composition of a compound. Such names are accurate and descriptive, nevertheless, they have universal meaning only to chemists and certain other specialists. To the technically untrained or to those in other scientific pursuits, chemical descriptions are frequently too cumbersome to use and too difficult to remember. In the early use of a new, complex substance, several chemical descriptions may appear in the literature, which may contribute to confusion among users and result in mistakes in use and in treatment of poisoning. Many chemical names are so unwieldy that laboratory nicknames compounded from initials of the component groupings in the substance have become popular. Some abbreviated designations such as BAL, DDT, TNT, and 2,4 D are so firmly established in the public consciousness that a change to a more descriptive name is now a formidable problem. The difficulties engendered by an increasing use of trivial and trademarked initials, numbers, or combinations of the two should be obvious to all.

Proprietary, brand, or trademarked names for chemicals are subject to similar limitations. Although trade names are necessary and useful tools of our competitive system, they have a tendency to conceal rather than to reveal the nature of the product. The myriad of fanciful names, which are trademarked for preparations containing a widely accepted chemical, pre-dispose prescribing and use by name rather than by nature of the compound and action desired. Labeling problems, confusion with names for unrelated and sometimes more dangerous preparations, and the exacting requirements of scientific literature preclude dependence solely on proprietary names as a means of identification. This has led to the coming of generic names as a direct and simple means of identifying the chemical compounds in commercial preparations. An estimate of their value to manufacturers and consumers alike can be gained from the history and experience of the procedure in this country.

HISTORY

One of the first, if not the initial, organized attempts to standardize the popular nomenclature of new chemicals was undertaken in 1911 by the Council on Pharmacy and Chemistry. Realizing the need for a common name for the chief constituent in the various brands of the blood pressure raising principle of the adrenal glands, the Council adopted epinephrin(e) as such a term. Further impetus to the Council's action was provided by the Federal Trade Commission in 1917. In carrying out the provisions of the Adamson Act, the Commission licensed American firms to use U S patents on certain synthetic drugs owned by German citizens. However, it required all licensees to use generic designations for the article Arsphenamin(e), barbital, cinchophen, and procain(e) were the common names required to be used in association with the drugs trademarked respectively as Salvarsan, Veronal, Atophan, and Novocain.

The next significant step in the medical employment of generic names occurred in 1920 when a prominent pharmaceutical firm began using short, coined, nonproprietary names

nature. World War II fostered a technologic revolution in the pesticidal chemical industry. The industry's growth and increased influence, plus a rise in the number and complexity of its products, focused attention on the advantages of having short, common names that technicians and users alike could conveniently remember. This prompted various public health and agricultural agencies to consider the use of coined, common names for pesticides.

In April, 1947, the newly formed Interdepartmental Committee on Pest Control, a group composed of representatives of the various departments of the federal government interested in pest control, approached the Council on Pharmacy and Chemistry concerning the development of acceptable, nonproprietary, common names for new economic poisons. The Council agreed to collaborate with the Interdepartmental Committee for the purpose of unifying and standardizing generic name selection for chemicals used as drugs, as pesticides, or interchangeably for both purposes. The relationship between the Council and the Interdepartmental Committee existed on a direct, collaborative basis for three years, then the Committee

TABLE 1—Representative Names for Pesticidal Chemicals Used as Economic Poisons

Generic Name	Chemical Name	Trade Names *	Other Names and Synonyms	Major Uses
Aldrin	1,2,3,4,10,10-Hexachloro-1,4,4a,5,8,8a-hexahydro-1,4,5,8-dimethanonaphthalene	Octalene	Compound 118	Insecticide
Allethrin	dl 2-Allyl-4-hydroxy-3-methyl-2-cyclopenten-1-one esterified with a mixture of <i>cis</i> and <i>trans</i> -dl-chrysanthemum monocarboxylic acid	Pyresyn	Allyl etherin Synthetic pyrethrins	Insecticide
Dieldrin	1,2,3,4,10,10-Hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octa-hydro-1,4,5,8-dimethanonaphthalene	Octalox	Compound 497	Insecticide
Methoxychlor	1,1,1-Trichloro-2,2-bis (p-methoxyphenyl) ethane	Marlate	DMDT Dianisyl analogue of DDT	Insecticide
Parathion	0,0-Diethyl-0-p-nitrophenyl thiophosphate	Aphamite Phoskill Kilphos Corothion Paraphos Genlthion Penphos Mackothion Vapophos Flantthion, and Thiophos	Compound E 60, Compound 312 ² DPP DNTP AAT	Insecticide
Toxaphene	Chlorinated camphene (67-69% Cl ₂)	Phenatox Penphene Gy Phene Terpene Phenacide, Toxakill Kilphene Chlorphene and Alitox	Compound 30,6	Insecticide
Warfarin	3-(α -Acetylbenzyl)-4-hydroxycoumarin	Dethmor Rat-deth and Ro-deth	Compound 42 WARF Compound 42	Rodenticide

* The list of trade names, other names, and synonyms is not intended to be complete but is given to illustrate the complexity of the nomenclature.

in connection with its trademarked names. Products were marketed under the trade name followed by the statement "brand of —, a nonproprietary name." The generic names were coined by the firm and accepted by the Council on Pharmacy and Chemistry as nonproprietary synonyms for inclusion in *New and Nonofficial Remedies*. In several instances, the coined name ultimately became the official name for the drug by virtue of its adoption by the United States Pharmacopeia.

The celebrated 'aspirin' and 'cellophane' court decisions further stimulated manufacturers to use generic names in conjunction with trade names. In both cases, it was ruled that the firms lost their trademark rights to 'aspirin' and 'cellophane' because the names had become accepted as popular designations for products represented by these names and, therefore, were not associated in the public mind as trade names. The pharmaceutical industry, as a group, was the most sensitive and immediately responsive to the legal precedents that these decisions established. As a consequence, an overwhelming majority of the manufacturers of prescription chemicals cooperate with the Council in the selection of generic nomenclature for drugs.

The need for uniform and universally recognized generic designations for pesticides has been slower to develop. Until World War II comparatively few and relatively simple inorganic and organic compounds were introduced and used at a rate sufficient for users to become acquainted with their

on Pesticides was formed, and it assumed the responsibility for the Council's part in this public service activity.

A list of common names for pesticidal chemicals adopted by the Interdepartmental Committee, which have been concurred in by the Council or the Committee on Pesticides, is presented in table 1. A list of similar names for pesticidal chemicals used as therapeutic agents, which have been adopted by other recognized groups here and abroad, is presented in table 2.

GUIDING PRINCIPLES

The following basic principles have been adopted and employed by the Council on Pharmacy and Chemistry, the Committee on Pesticides, and the Interdepartmental Committee on Pest Control in the consideration of generic names for chemicals.

Type of Names Acceptable—Names that are not in conflict with recognized proprietary or nonproprietary names in the same or other fields of commerce are acceptable. Proposed name should be short and distinctive in both sound and spelling and should avoid confusion with or encroachment on those already in use. Initials and numbers, alone or in combination as terminal designations, are considered unacceptable. When practicable, common names may conform to accepted scientific terminology, however, rigid conformity to chemical, biological, or other rules of nomenclature, to the exclusion of

practical considerations pertinent to the class of compounds involved or the major users affected, is not intended

Types of Compounds Eligible—Eligible compounds are those that have been defined by the selecting agency identified with the field of commerce in which principal use of the chemical may be expected. The name should apply to the pure basic chemical to avoid multiple and dissimilar names for salts, esters, isomers, homologues, dosage forms, and other variations of the parent compound. When a compound is not sufficiently well known, when it is not widely used or only holds promise of use, or is otherwise unsuitable for identification by a coined, common name, selection may be deferred or rejected until conditions warrant reconsideration.

Nature and Time of Application—Proposals for common names may be initiated by manufacturers, formulators, distributors of the basic chemical, or recognized noncommercial organizations interested in the proper utilization of the substance. The style of application varies with the selecting agency, which is guided by the needs of those who will ultimately use

further limited. It is, therefore, of utmost importance that the various problems of generic name selection be thoroughly understood.

CURRENT PROBLEMS

The trend toward trademarking names that are the same or nearly the same as accepted chemical and generic designations is one of the more highly detrimental of current practices. It is a problem common to pesticides as well as to drugs. Evidence of this condition is the misappropriation of the coined, common names lindane, chlordane, and warfarin, which have been registered as proprietary names outside the country of their origin. These acts not only preclude the general use of otherwise acceptable popular names in the countries where pirating occurs but they also contribute to misunderstanding and confusion in foreign literature. Aside from etymological difficulties, they impose unnecessary legal hardships on exporters and international brokers of pesticidal chemicals. In addition, the unethical practice of utilizing names familiar to one group of chemicals and applying them to sub-

TABLE 2—Representative Names of Pesticidal Chemicals Used as Therapeutic Agents*

Official or Generic Name	Chemical Name	Trade Names	Other Names and Synonyms*	Major Uses

† See table 1

it. In general, information on the physical and chemical nature, mammalian toxicity, and demonstrated uses of the compound are required. Data on existing trade names, laboratory synonyms, and related nontechnical items may be required. Common names should be proposed prior to commercial introduction of the chemical. The final selection is based on cooperative consideration by various industrial, scientific, and professional organizations who share a common interest in the employment of the chemical.

Ingenuity is required to coin generic names that are short, distinctive, and not in conflict with terms already in use. Two systems of nomenclature have been used on an organized basis for this purpose. The first system employs pseudochemical terms, which suggest the nature and structure of the compound. Benzene hexachloride, borax, and phenobarbital are examples. The second method utilizes fanciful terms, which bear biological, historical, or less tangible relationships to the chemical to which it is applied. Dieldrin, nicotine, and penicillin are illustrations of this approach. Both techniques are open to objections, one of the most important is the tendency for names to become multisyllabic as the possibilities for selection diminish. Unfortunately, this is an inevitable consequence of scientific accomplishment. As the volume of new and useful compounds expands, the number of acceptable two or three syllable word combinations decreases. If distinctiveness in sound and spelling are additional requirements, the choice is

stances of another classification with only minor modifications in spelling is of little consequence at the present, but it can certainly grow if the increasing demands and decreasing possibilities for new names continue.

The establishment of a unified system of nomenclature is the keystone on which rest all educational efforts to extend to the public the benefits of new advances. The development of generic names for chemicals should not be undertaken in a manner that creates further confusion nor should it be in conflict with legal or other requirements of the public interest. It is exceedingly difficult, however, to coin common names that do not infringe or otherwise encroach on proprietary or nonproprietary names in various fields. For this reason, it is sometimes necessary to tolerate more than one nonproprietary designation for a given chemical with multiple uses. When such a situation exists, it is not always practical or feasible to substitute a new name for existing names that are widely accepted in different fields of commerce or in various parts of the world. A more convenient and practical solution is to use interchangeably the adopted nonproprietary names as accepted synonyms for the chemical in the country or technical field in which they are not now officially recognized. This would adjust an otherwise confusing situation and universalize scientific language. Table 2 lists chemicals for which this would be advantageous.

Intranational and international agreement on terminology can minimize the frequency of these occurrences and facilitate suitable compromise. Agreement can come only through co-

operation with and appreciation for the peculiar needs of the various groups served by each of the official and professional organizations responsible for formulation of generic names. A greater exchange of information, standards, proposed terms, and other pertinent data by responsible agencies here and abroad would assist in creating the desired accord. The Committee hopes that greater consideration will be given to this concept in the future.

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

APPARATUS ACCEPTED

The following additional products have been accepted as conforming to the rules of the Council on Physical Medicine and Rehabilitation of the American Medical Association for inclusion in Apparatus Accepted. A copy of the rules on which the Council bases its action will be sent on application.

RALPH E. DE FOREST, M.D., Secretary

Zenith Hearing Aid, Model Regent

Zenith Radio Corporation, 5801 Dickens Ave., Chicago 39

Zenith Hearing Aid
Model Regent

The Zenith Hearing Aid, Model Regent, is an electronic instrument with three vacuum tubes powered by a 1.5 volt A battery and a 22.5 volt B battery. It measures 113 by 57 by 22 mm and weighs 191 gm including batteries, receiver, and receiver cord. The tone control and an off-on switch with volume control are located at the upper corners. A gain control and additional control for power output are located inside the instrument.

A magnetic receiver for air conduction is provided and telephonic pickup is an intrinsic part of this instrument. By placing the receiver of the telephone near the lower portion of the hearing aid case and adjusting the switch, it is possible to pick up telephone conversations directly by electromagnetic radiation instead of picking up sound by vibrations from the air about the telephone receiver. This eliminates some extraneous noise.

Otarion Hearing Aid, Model H 1, Custom "5"

Otarion, Inc., 4757 N. Ravenswood Ave., Chicago 40

Otarion Hearing Aid
Model H 1

The Otarion Hearing Aid, Model H 1, Custom 5 is a five tube instrument requiring one 1.5 volt A battery and one 30 volt B battery. It is intended for the use of patients with rather severe hearing losses and has a maximum acoustic output as high as 125 db for frequencies under 2,000 cps. A special circuit protects the user from the excessively loud sounds that might otherwise result from such amplification.

The body of the instrument measures 102 by 63 by 22 mm and weighs 142.5 gm. With batteries, ear phone, and receiver cord the total weight is 217 gm. The volume control is combined with the on-off

switch. There is a tone control on the outside and a power control inside the instrument, accessible through a crescent shaped opening.

Torbot Ileostomy Outfit

The Torbot Company, 284 Elmwood Ave., Providence 7, R. I.

The Torbot Ileostomy Outfit is designed to be worn by patients after surgical operations that result in a discharge of liquid intestinal contents from a fistulous opening. It consists essentially of a rubber bag and a plastic ring. The rubber bag has two openings, the lower one being used for the removal of intestinal contents. The upper opening is maintained in place over the stoma and held open by a flange that encircles the central opening of the plastic ring. Metal fastenings on the ring connect it with an elastic belt. An adhesive compound is provided to help maintain the position of the ring and to make the connection between ring and skin both water tight and air tight. The complete outfit includes two rubber bags, two rings (perforated disks), translucent plastic, elastic belt, spring and hook (for use in drying bag after cleansing), rubber bands (to close lower opening) and a tube of adhesive compound.

Torbot Ileostomy Outfit

The manufacturer considers the use of the adhesive compound essential to insure an air tight and water tight contact of the outfit with the skin about the stoma. Evidence obtained by the Council showed that this adhesive is harmless if time is allowed after each application for the solvent to evaporate. It is understood that users will be properly instructed on this point.

Ohio Oxygen Tent, Model 90A

Ohio Chemical & Surgical Equipment Co. (A Division of Air Reduction Co. Inc.), 1400 E. Washington Ave., Madison 10, Wis.

The Ohio Oxygen Tent, Model 90A, is a device for administering oxygen to patients in bed. It consists of a canopy of transparent plastic and a cabinet, mounted on casters for cooling and circulating the oxygen. The cooling and circulating mechanism requires 50 to 60-cycle alternating current at 115 volts and it draws 630 watts. The crated tent measures 140 by 64 by 64 cm (55 by 25 by 25 in.) and weighs 89 kg (265 lb). This shipping weight includes the regulator and tent hood.

From a source acceptable to the Council, evidence was obtained indicating that oxygen concentrations exceeding 50% could be obtained under this tent with an oxygen flow of 8 liters per minute.

Ohio Oxygen Tent
Model 90A

Telex Hearing Aid, Model 953

Telex, Inc., Telex Park, St. Paul 1

The Telex Hearing Aid, Model 953, is an electronic instrument utilizing three vacuum tubes and requiring one 1.5 volt mercury type A battery and one 30 volt B battery. A magnetic receiver for air conduction is provided. The instrument measures 92 by 45 by 27 mm and weighs 156.7 gm with batteries, receiver, and receiver cord.

PORTRAYAL OF PHYSICIANS IN TELEVISION AND RADIO ADVERTISING

THE JOURNAL has received many complaining letters from physicians and others who resent the present trend in advertising circles to feature stethoscopes, white coats, and medical claims in advertising programs. They assert this is a cheap attempt to mislead the audiences into believing that the claims have been proved medically. They also claim, and there seems to be an increasing accumulation of evidence to support this belief, that most of the audiences have been exposed to so much of this drivel that there is not only suspicion or even disbelief but actual resentment when programs featuring such advertising are offered. At least some physicians are so disturbed that they have been known to go out of their way to explain to patients, and sometimes to larger groups, the nonsense involved in such obvious deception. While advertisers may claim that the medical profession makes up only a small part of the total population, they should not forget that the doctors' voices can be heard in ever-widening circles and that the public is not so lastingly gullible as some advertisers seem to believe.

At the last meeting of the American Medical Association, its House of Delegates was asked to consider a resolution on this subject from a state medical association. After careful consideration the House adopted a report from a reference committee that recommended study by the Board of Trustees, a meeting of mutually interested parties in the radio and television industry, and the consultation of county and state medical societies with local radio and television stations to effect solutions for advertising problems that affect the medical profession.

This action of the House speaks for itself, and it should be carefully studied by all who are interested in this subject. Radio and television provide remarkable outlets for entertainment and educational programs. Their effective-

ness is applauded by all, and it is unfortunate that this admiration should be diluted by criticism that could be avoided, especially when the criticism is based on actions originating outside of this industry.

HEMODIALYSIS IN THE TREATMENT OF BARBITURATE POISONING

Barbiturate poisoning is usually treated by using various measures to maintain life until the drug can be either excreted or metabolized. Recently, Kyle and associates¹ examined the possibility of removing this toxic substance from patients by use of the artificial kidney, hemodialysis has already been suggested for bromine² and acetylsalicylate³ intoxication. A toxic substance must not be too firmly bound to protein in the body if it is to be removed by hemodialysis, and the equilibrium between the bound and free drug must be readily established. In this manner the free barbiturate is constantly being removed by the dialysis. Evidence that only a portion of the circulating barbiturate is in the bound form has been presented earlier by Brodie and his co-workers.⁴ Kyle and associates have noted that, when patients who were being treated by the artificial kidney for renal disease were given phenobarbital prior to the dialysis, 66% of the administered drug was found in the dialysis fluid. Under similar conditions a patient lost 18% of a given dose of amobarbital (Amytal) in the dialysis fluid. For the purpose of comparison, normal persons without kidney disease were given equivalent amounts of the same barbiturates, and in the same period of time (2.5 hours) they lost 4% of the phenobarbital and 0.5% of the amobarbital in the urine, the low recovery of the amobarbital being attributed to the fact that it is metabolized in the body. This would indicate that hemodialysis is 16 times more effective than the kidney for removing phenobarbital and 36 times more effective for amobarbital.

The artificial kidney was employed in two cases¹ of severe barbiturate poisoning, one due to the ingestion of an unknown amount of pentobarbital (Nembutal) and the other to the ingestion of 10 gm of amobarbital sodium. Both patients arrived at the hospital in a comatose state and were unresponsive to all stimuli. In the five hour period before dialysis the first patient excreted 30 mg of barbiturate in the urine as compared to the loss of 745 mg of the drug in the dialysis bath of the artificial kidney during an identical period. Eight hours after dialysis the patient regained consciousness and made an uneventful recovery. The second patient began to respond to painful stimuli after three and a half hours with the artificial kidney, became completely conscious 16 hours after dialysis and had an uneventful recovery. During the four hour period prior to dialysis she lost 10 mg of barbiturate in the urine compared to 300 mg of the drug removed by the hemodialysis in the same time interval. In this case, 30 times as much barbiturate was removed by dialysis as was excreted by the kidney. Patients with barbiturate poisoning tolerate the hemodialysis well and show an improvement in clinical status during the dialysis.¹ In addition to removal of barbiturate as shown by an increased amount of the drug in the dialysis liquid there is also a fall in blood barbiturate level.

Leonards and Sunshine⁵ have recently reported the removal of barbiturates from the blood of experimental animals by the use of the artificial kidney. Dogs were given sodium pentobarbital, and the dialysis procedure was begun one to two hours later. It was noted that the animals that received larger doses of the drug required a longer period of dialysis before spontaneous movements occurred (e.g., a dog that received 520 mg had to be treated for three to four hours, while those that were given 800 mg required six hours). These investigators found that 13 to 25% of the administered drug was removed by the hemodialysis and less than 5% was found in the urine. The artificial kidney decreased by two to four hours the time necessary for the blood barbiturate level to fall to 1.5 to 2.5 mg per 100 ml, a blood range where spontaneous movement began. It was concluded that hemodialysis may have only a limited use for cases of intoxication with this barbiturate.

At present, dialysis with the artificial kidney is a safe procedure, and, since use of this procedure is becoming more widespread for various types of renal insufficiency, equipment and trained personnel are becoming more available. Thus, with further investigation, the use of the artificial kidney may become one of the active means of treating severe barbiturate poisoning.

DANGERS OF TREATY LAW STILL EXIST

At its meeting in New York City during the first week in June the House of Delegates of the American Medical Association reiterated its endorsement of "the principles embodied" in the Bricker Resolution and urged the active support of the entire medical profession.

On June 4, 1953, a compromise resolution was adopted by the Senate Judiciary Committee by a vote of 8 to 4. The resolution agreed on included some of the provisions contained in S J Res 1, 83rd Congress, introduced by Senator Bricker for himself and 63 other senators and some of the language contained in S J Res 43, 83rd Congress, introduced by Senator Watkins for the American Bar Association. One of the original provisions of S J Res 1 that drew much criticism has been eliminated. It would have prohibited a treaty from allowing "any foreign power or any international organization" from interfering with constitutional rights of United States citizens within the United States "or any other matter essentially within the domestic jurisdiction of the United States." It was felt that such a provision might be construed to outlaw such matters as a treaty for international control of atomic weapons. It was also felt that it would be too difficult to determine which matters were "essentially within the domestic jurisdiction" of the United States.

The provision of the original version of S J Res 1 pertaining to executive agreements was also changed. Originally the resolution would have prevented the President from making any executive agreements with foreign or international authorities until Congress had laid down the rules for making them. Under the revision, the President could make agreements without supervision but Congress would have the power to regulate such agreements.

During the hearings before the Senate Judiciary Committee, various witnesses appeared on behalf of the administration in opposition to these resolutions. Secretary of State Dulles testified, in part, that the resolutions would subject the current day-to-day conduct of foreign affairs to "impediments which might be stifling" and he urged that "these far-reaching proposals" first be given thorough study by a special group made up of members of the Congress and the legal profession. He also told the Senate committee that the amendments proposed were now "unnecessary" and "dangerous" and that fears of abuse of the treaty power had become "hypothetical." It is interesting to note that only a year before his appearance before the Senate committee Dulles stated in an appearance before a regional meeting of the American Bar Association "The treaty making power is an extraordinary power liable to abuse. Treaties make international law and also they make domestic law. Under our Constitution treaties become the supreme law of the land. They are indeed more supreme than ordinary laws, for congressional laws are invalid if they do not conform to the Constitution, whereas treaty law can override the Constitution. Treaties can cut across the rights given the people by the constitutional Bill of Rights."

Irrespective of the reasons for this change in the official position of the administration, it seems clear that so long as legitimate reasons for doubt exist there is no way to insure that the rights of Americans cannot be bartered or given away short of action by the Congress. Certainly, as long as the machinery exists for the formulation of covenants such as the Minimum Standards of Social Security adopted a short time ago by the International Labor Organizations, these "legitimate reasons for doubt" are justified. The medical profession should therefore restate as emphatically as possible its endorsement of S J Res 1, 83rd Congress, and urge its adoption by the Congress at an early date.

DRUG REACTIONS

Elsewhere in THE JOURNAL (page 816) is a report to the Council on Pharmacy and Chemistry on hypoplastic anemia and related syndromes caused by drug idiosyncrasy, which provides material of value to all physicians who administer drugs. Of special interest is the creation of a system whereby instances of dangerous reactions following drug therapy can be reported to the Council's Committee on Research. The report in THE JOURNAL is part of a program by which the committee will attempt to investigate the causes and incidence of hypoplastic anemias in the United States. Already a Subcommittee on Blood Dyscrasias has been appointed to provide a plan of study for analysis of reports of hypoplastic anemia. The committee and the Council hope that these and other studies that eventually will ensue will result in information and suggestions of value for practicing physicians. In the meantime, all physicians are urged to report immediately all incidents of untoward drug reactions to the Committee on Research, American Medical Association, 535 N Dearborn St., Chicago 10.

THE PRESIDENT'S PAGE

A MONTHLY MESSAGE

In trying to compose my first article for this page, I find it difficult to collect my thoughts. I am still trying to recuperate from the most arduous and exciting week of my life. Both Mrs. McCormick and I enjoyed the opportunity of meeting so many of you individually at the reception that followed the inaugural ceremony in the Commodore Hotel. It was an experience that we shall always treasure. My only regret is that it was physically impossible to meet and shake hands with every doctor and every member of the Auxiliary who attended this, the greatest of all A. M. A. conventions. In the year ahead, as I attend the various local and regional meetings, I look forward to the opportunity of meeting many of you again and becoming personally acquainted with many other A. M. A. members.

As I look back over the accomplishments of the American Medical Association in the past 106 years, I find the temptation toward complacency very great. There are too many doctors who are passive and who take no part in the effort to solve the problems of medicine. It is true that to this date we have been successful in withstanding the onslaughts of the social planners who would impose assembly line medicine on the nation, without regard to the quality and the quantity of such medical service, but the battle is not over. The Congress of Industrial Organizations, under the leadership of Walter Reuther, is still probing for cracks in the dike of common sense with a view toward loosing a new flood of propaganda that would drown the sound reasoning of opponents to socialized medicine. Only last December, at its annual convention, the CIO advocated the welfare state as follows: "The CIO reaffirms its support for a national health program which will provide the people of our nation with needed medical services, facilities and personnel. Such a program must include expanded federal aid to medical research, to state and local public health units, to medical and nursing education and medical cooperatives, to maternal and child health care, and to an effective mental health program. It must also include a system of national health insurance."

CIO President Reuther extended his personal blessing to the program by stating that some form of federal health insurance seems to me to be the only adequate answer. Perhaps the key to the CIO's intense desire for a national health insurance program lies in this sentence from an article published recently in the "Economic Outlook": "Contributions would be in proportion to people's ability to pay, and unions could bargain to have employers carry the full cost."

Not only must we remain alert to the danger of a continued and intensified campaign for assembly line medicine but we must continue to bring to the people the true story of American medicine and its vital concern with the health of the nation. There is no need for physicians to be apologists for their profession. By their own actions in their own offices they can do the best job of public relations imaginable. A little extra care in the scheduling of appointments can eliminate much dissatisfaction among patients. A sensible attitude toward fees goes a long way toward creating good will. And let us remember that people do not always get sick during convenient daytime hours, that the doctor's convenience and comfort are always secondary to the needs of patients insofar as the doctor is physically able to perform his or her duties.

By vigorous self-application to the task, the great majority of honest, ethical practitioners can nullify the charges of misdeeds—aimed at a very few—that have tended to reflect on the entire profession. We should be merciless in eradicating from our ranks the small minority of "doctors" (and I use the quotation marks advisedly) who befoul the honorable traditions

and principles of medicine that have existed since before the days of Christ. Every medical society in the nation should have a strong and fearless mediation committee to hear the complaints of patients. They should not be stampeded into witch hunts, but at the same time they must be swift and decisive in their actions when guilt is established beyond a doubt.

I would say that one of medicine's greatest weaknesses at the present time is within the profession itself. On the political scene the honest efforts of the leaders of medicine have recently been heralded as "selling the profession down the river." It has been said that the Association is reputed to have made a deal with the American Legion. As a matter of fact, we are opposed to the treatment of non-service-connected disabilities, except tuberculosis or psychiatric or neurological disorders suffered by veterans who are unable to defray the expenses of necessary hospitalization. Many of us who are members of the Legion recognize in the present program of veterans' care socialism and the fall of democracy. It is an honor and a duty to have served our country, and we should not expect life long support and special privilege because we have defended our country, our homes, and families.

Physicians themselves have prompted much of the unfavorable publicity that has developed throughout the country recently. It would seem that a concerted effort is being made to divide and conquer the profession when now, above all other times, we have a golden opportunity to progress. There is an overriding need for unity. May I stress once again some of my remarks made before the House of Delegates in New York City a few years ago, when we had to close ranks and fight shoulder to shoulder against an immediate threat of compulsory health insurance, we worked as a team. With some of this pressure off, I have noticed a distressing regression toward petty internal wrangling, charges, and countercharges. Constructive criticism has a universally recognized place within any democratic group. But once official action has been taken by the A. M. A. House of Dele-

gates or the governing body of any county or state group I believe we should understand that the democratic process has had its way and the majority has ruled.

This does not mean we cannot continue to work for our personal beliefs. We should work for them in an orderly fashion within the ranks of organized medicine, and we should encourage all physicians to work for change in this way. Quiet persuasion can be a potent force. On the other hand, violent charges in the public press and uninformed testimony before Congress are destructive rather than constructive tactics.

And while we strive for this harmony within our own ranks let us not forget that greater participation in civil undertakings by the individual doctor is equally important. Too many physicians have been isolationists within their communities. We cannot expect service clubs, fraternal organizations, P. T. A. groups, church associations, and unions to be interested in our problems if we are not interested in theirs.

The A. M. A. presidency bears with it grave responsibilities. During the coming year I shall need the wholehearted assistance of every member to help me fulfill the obligations of this office. It is only through your cooperation and loyalty that the A. M. A. can continue to advance the ethical standards of American medicine and promote the public health and welfare. I hope only that I shall be able to live up to the high standards set by my predecessor, Dr. Louis H. Bauer, who gave so unselfishly of his time and energy in serving you.

EDWARD J. MCCORMICK, M.D., Toledo, Ohio

ORGANIZATION SECTION

JOINT COMMISSION ON ACCREDITATION OF HOSPITALS

At its meeting on April 19, 1953, in Chicago, the Board of Commissioners of the Joint Commission on Accreditation of Hospitals reviewed the recommendations on surveys of 284 hospitals that had been conducted by field representatives of the American College of Surgeons, the American Hospital Association, and the American Medical Association since Jan 1 1953. The board granted full accreditation to 199 hospitals and provisional accreditation to 46, 38 hospitals were not accredited. These hospitals were informed of their status on or about May 15.

The board reviewed the recommendations of three committees that had been appointed to consider changes in the standards published in the "Manual of Hospital Accreditation." Two significant revisions in the standards were made, one of which will serve to ease the multiplicity of monthly meetings that medical staff members must attend, while the other clarifies and makes more specific the organization and functions of general practice departments in hospitals. In addition, certain regulations were adopted as an interpretation of the standard requiring safety precautions in roentgenology departments.

Medical Staff Meetings—Hospitals whose medical staffs have complained about the need for attending a multiplicity of monthly staff meetings will be pleased to learn of an additional alternative in the standards that will assist in improving the quality of medical care. Monthly meetings of the medical staff were designed primarily to aid the staff in discharging its full responsibility for establishing and maintaining high quality of medical care in the hospital. Such meetings, therefore, should be devoted to the thorough review and analysis of the professional management of all discharged patients. In recent years, in hospitals having departmental organization with well-qualified and highly specialized clinical staffs, importance has been placed on departmental and clinico-pathologic conferences for extensive study of each patient's record. With a program of departmental conferences, meetings of the entire active staff are required quarterly. It was agreed that the sole reason for requiring staff meetings is to insure good medical care and treatment of patients in hospitals. The discussion centered on the question "Are medical staff meetings the best method for accomplishing this?"

In this discussion, the following principles were agreed to:

- 1 The medical staff is responsible for the quality of medical care in the hospital and must accept and assume this responsibility, subject to the ultimate authority of the hospital governing board.
- 2 The medical staff must be a self governing body.
- 3 Staff meetings are held for the purpose of reviewing the medical care of patients within the hospital and not for the presentation of scientific papers or discussions.
- 4 Regular and frequent meetings of departmental staffs to review clinical work are accepted as essential in well-organized hospitals.
- 5 Medical staff meetings cannot be held in conjunction with those of another hospital or with local medical societies.

In addition to the present standards, which require a monthly staff meeting with 75% of the active staff in attendance, or, in well-departmentalized hospitals where departmental meetings and clinico-pathological conferences review the clinical work, a quarterly staff meeting, the following alternative was adopted to insure a thorough review of the medical care practiced in the hospital: (1) an active medical records committee to review the record of every patient discharged from the hospital, (2) an active tissue committee to study all pathological reports in relation to clinical data, (3) an executive committee of the medical staff to review and to take action on the findings of the medical records and tissue committees, and (4) general

staff meetings to inform and to discuss with the entire medical staff the quality of care currently rendered in the hospital.

The approved standard relating to medical staff meetings follows:

'Section A-2-a

(6) Committees The following are required:

'(a) Executive Committee to co ordinate the activities and general policies of the various departments, to act for the staff as a whole under such limitations as may be imposed by the staff, and to receive and act upon the reports of the Medical Record, Tissue, and such other Committees as the medical staff may designate. The Executive Committee to meet at least once a month and maintain a permanent record of its proceedings and actions.

"(d) Medical Records Committee, to supervise and appraise medical records, and to insure their maintenance at the required standard. Such Committee to meet at least once a month and submit to the Executive Committee a report in writing which will be made a part of the permanent record.

"(e) Tissue Committee, to study and to report to the staff, or the Executive Committee of the staff, the agreement or disagreement between preoperative diagnoses and reports by the pathologist on the tissues removed at operation. Such Committee to meet at least once a month and submit to the Executive Committee a report in writing to be made a part of the permanent record."

Section A-2-a

"(7) Staff Meetings The sole objective of staff meetings is improvement in the care and treatment of patients in the hospital. Unless such objectives are met fully by the program set forth (in B 2 a (4)), below, monthly meetings of the staff, not less than twelve in each calendar year, are required. Active staff attendance shall average at each meeting at least 75% of the active staff who are not excused by the Executive Committee for exceptional conditions such as sickness or absence from the community. Each active staff member shall attend 75% of staff meetings unless excused by the Executive Committee for exceptional conditions such as sickness or absence from the community. In addition to matters of organization, the programs of such meetings must include a report of the Executive Committee and be limited largely to the review of current or recent cases in the hospital. Scientific programs not associated with the work of the hospital do not meet this requirement.

'Section B 2-a

(4) Staff Meetings (a) In hospitals where adequate review of the medical work in the hospital is carried out by the Medical Records and Tissue Committees and appropriate study and action is taken by the Executive Committee on not less than a monthly basis, one meeting of the entire Active Staff must be held during each quarter of the year. At such meetings a report of the medical work of the hospital must be presented by the Executive Committee.

'(b) In well-organized and departmentalized hospitals, at least monthly departmental conferences and clinico-pathologic conferences may be substituted for meetings of the entire staff, provided that all of the medical work of the hospital is covered by one or another of such conferences, and further provided that at least one meeting of the entire Active Staff is held during each quarter of the year. At such meetings a report of the review of its medical work of the hospital must be presented by the Executive Committee. The attendance requirements applies at all such meetings (see A-2-a (7), above).

(c) Business or other executive sessions of the staff will be conducted by the Active Staff and other categories of the staff may be excluded.

General Practice Departments The standard which permits elective General Practice departments in well-departmentalized hospitals was changed to read as follows

"A Department of General Practice shall be an organized segment of the medical staff comparable to that of other staff departments with the following limitations

'1) The responsibilities of this department shall be limited to administration and education. It shall not be a clinical service and no patients shall be admitted to the department. If and when desirable, however, the department may be made responsible for conducting the out-patient clinic in whole or in part

"2) Since the Department of General Practice will not have a separate service, the members of the General Practice Department shall have privileges in the clinical services of the other departments in accord with their experience and training, on recommendation of the Credentials Committee. In any service in which any general practitioner shall have privilege, he shall be subject to the rules of that service and subject to the jurisdiction of the chief of the clinical service involved"

EDWIN L. CROSBY, M.D.

FEDERAL MEDICAL LEGISLATION

Detention of Narcotic Addicts

Congressman Miller (R, Neb.) in H. R. 5422 proposes to authorize the forcible detention of narcotic addicts committed by state courts to U. S. Public Health Service Hospitals until the addicts are cured. The bill would also require those who voluntarily submit to treatment in a U. S. Public Health Service Hospital to take the complete treatment. States would pay the cost for persons committed by state courts. Under the present law, narcotic addicts convicted in federal courts of offenses against the United States may be forcibly detained in a U. S. Public Health Service Hospital until treatment is completed, however, persons who voluntarily submit themselves for treatment and persons committed by state courts cannot be detained against their will. This is identical with S. 1994 (Beall) previously reported. This measure was referred to the Interstate and Foreign Commerce Commission.

Tax Deduction for Annuities

Congressman McDonough (R, Calif.) in H. R. 5452 proposes to permit an annual deduction of amounts up to \$2,400 for the purchase of annuities, pensions or retirement benefits in calculating income tax. The bill was referred to the Ways and Means Committee.

Hospitalization for Dependents of Deceased Members of Coast Guard

Congressman Bennett (D, Fla.) in H. R. 5498 would authorize the Navy to provide hospitalization services for widows and dependents of Coast Guard members if the members die while serving in the Coast Guard when it is a part of the Navy. This was referred to the Committee on Armed Services.

Calculation of Social Security Retirement Rate

Congressman Kean (R, N. J.) proposes in H. R. 5533 to change the method of computing the average monthly retirement benefit by basing such benefits on the best 10 consecutive years of earnings. During the consideration of the waiver of premium for disability legislation in the last Congress, the American Medical Association suggested a similar plan to avoid the necessity of medical determinations in disability cases. This measure was referred to the Ways and Means Committee.

STATE MEDICAL LEGISLATION

California

Bill Enacted.—S. 1349 has become ch. 1034 of the laws of 1953. It amends the Business and Professions Code relating to the use of fictitious names by individual practitioners or partnerships by providing that holders of physicians or surgeons' certificates may practice within the scope of their respective certificates in partnerships or groups of physicians and surgeons provided that after Sept. 30, 1953 no such partnership or group shall be formed or organized under any name except a name that includes the surname of one or more members of the partnership or group followed by the words "Medical Group."

Connecticut

Bill Enacted.—S. J. R. 38 was adopted April 30, 1953. It provides for the appointment of a commission to conduct a study of the establishment of medical, dental, and veterinary colleges on a New England regional basis and to collaborate with commissions in other New England states conducting similar studies.

Florida

Bill Enacted.—H. 1142, became law without approval June 1, 1953. It authorizes the board of county commissioners in counties of a certain size to provide for life and accident hospitalization or annuity insurance or all or any of such insurance for county employees and their families upon a group insurance plan and to enter into agreements with insurance companies to provide such insurance.

Iowa

Bill Enacted.—S. 235 was approved May 22, 1953. It provides that an autopsy or postmortem examination may be performed upon the deceased person by a physician or surgeon whenever the written consent thereto has been obtained in any of the following manners: by written authorization signed by the deceased during his lifetime; by written consent of any party whom the deceased, during his lifetime, designated by written instrument to take charge of his body for burial; by consent of the surviving spouse if there is no surviving spouse; by the consent of an adult child, brother, parent, or sister of the deceased; if none of the above persons are available then by consent of any other relative or friend who assumes custody of the body for burial.

Maine

Bill Enacted.—H. 1274, was approved May 7, 1953. It amends the law relating to blood tests of pregnant women by requiring a blood sample of such women to be submitted to a laboratory for a standard serological test for the determination of RH factors.

Massachusetts

Bills Introduced.—H. 2756 proposes the appointment of a special commission to investigate the question of the establishment of one or more medical schools by the University of Massachusetts and to develop an adequate program of higher education. S. 730 proposes the creation of an unpaid special commission to make an investigation relative to services of physicians for certain permanently and totally disabled persons.

Bill Enacted.—S. 720 has become ch. 437 of the laws of 1953. It amends the general law by defining a place of public accommodation, resort, or amusement as including a hospital, dispensary or clinic operating for profit.

Michigan

Bills Enacted.—H. 1342 has become pub. act no. 95 of the acts of 1953. It provides that no autopsies, postmortems and dissections shall be performed upon the body of a deceased person except by a licensed physician who has been granted written consent therefor by whichever one of the following assumes custody of the body for the purpose of burial: father, mother, widow, widower, guardian next of kin, or person charged by law with the responsibility of burial. S. 1293 has become public act no. 181 of the acts of 1953. It provides for the submission to the voters of a referendum which would abolish the office of coroner and create the office of county medical examiner in any county in which the referendum is approved.

Pennsylvania

Bills Introduced.—H. 779 to amend the law relating to chiropractic, proposes to authorize the licensing of individuals by reciprocity on the basis of a license obtained in other states or the District of Columbia maintaining substantially the same standards for licensure as those which exist in Pennsylvania. S. Serial No. 135 proposes to direct the joint state government commission to make a comprehensive and intensive study of the needs and problems of the aging and the aged.

Wisconsin

Bill Enacted.—S. 346 has become ch. 165 of the laws of 1953. It requires that in cities of a certain size the health commissioner must be a regularly licensed physician or in lieu thereof a person other than a physician with training and experience in public health administration and such individual shall devote his full time to duties of the office and shall not engage in the private practice of medicine or in any other conflicting occupations.

PROCEEDINGS OF THE NEW YORK MEETING

ABSTRACT OF PROCEEDINGS OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION AT THE ANNUAL MEETING IN NEW YORK CITY, JUNE 1-5, 1953

(Continued from page 743)

Report of Council on Constitution and Bylaws

Dr Louis A Buie, Chairman, presented the following report, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws, with the exception of the portion recommending a specific amendment of the Principles of Medical Ethics, which was referred to the Reference Committee on Miscellaneous Business

1 Matters Referred by the House of Delegates—The House of Delegates at its December, 1952, session considered the Johnson Resolutions on Funding of Policies of the House of Delegates These resolutions read as follows

WHEREAS The Board of Trustees has invited the attention of the House of Delegates to a lack of clarity which now exists in the Constitution of the Association whereby an action of the House of Delegates taken in June 1952, was found to be unconstitutional and

WHEREAS The functions of the House of Delegates are (1) to determine the policies of the American Medical Association and (2) to fix dues and assessments and

WHEREAS The control of finances essential to implement specific matters that are the policies of the House of Delegates is not now clearly defined in the Constitution and Bylaws and

WHEREAS It is not the purpose of this resolution to control all financial policies of the Association but simply to define certain prerogatives of the House therefore be it

Resolved That notwithstanding the rights and duties of the Board of Trustees as defined in the Constitution and Bylaws it shall be the duty of the Board to provide sufficient funds within the means of the Association to implement such policies programs and measures as may be from time to time adopted by the House of Delegates and be it further

Resolved That the Council on Constitution and Bylaws be instructed to make all necessary changes needed to attain the purpose of this resolution

The reference committee report, which was adopted by the House of Delegates, referred the matter to the Council on Constitution and Bylaws for implementation and instructed the Council to prepare a report and submit it to the House of Delegates at this session After careful consideration, during which legal counsel was employed, the Council on Constitution and Bylaws prepared the following statement and recommends that it be substituted for the second sentence of Paragraph (A) of Section 4, Chapter XVI

All resolutions and recommendations of the House of Delegates pertaining to the expenditure of funds shall be referred to the Board of Trustees which shall determine if the expenditure is advisable If it is decided that the expenditure is inadvisable the Board shall report at its earliest convenience to the House of Delegates the reasons for its action This procedure conforms to the statutes of the State of Illinois under which the American Medical Association is incorporated

2 Minority Reports of Reference Committees—The members of the Council believe that it is necessary to clarify the method of presenting minority reports and the obligations of reference committee members who wish to make such reports Therefore it is recommended that Section 2 of Chapter XII be amended by the insertion of (A) before the title 'References,' and that the following new paragraph be added

(B) Minority Reports—A member of a reference committee who wishes to make a minority report must refrain from signing the majority committee report and must make his intentions known to the other members of the reference committee while it is in executive session and prior to the presentation of the majority report to the House of Delegates

3 Clarification of Section 3 Chapter XII—The Council recommends that this section be amended to read

Section 3 Organization—(A) Each reference committee shall convene whenever necessary It shall consider business referred to it and shall report to the House of Delegates when called on by the Speaker A majority of the members of each committee shall constitute a quorum

4 Amendments Suggested by the Membership and Records Department for the Purpose of Clarifying the Provisions of the Bylaws Which Pertain to Membership—(1) Add a new Section 6 at the end of Chapter I, as follows 'Section 6 Limitation to One Membership—A member shall hold only one type of membership in the American Medical Association at any one time'

(2) Add to the first paragraph of Section 4, Chapter III, "and provided the request for exemption is transmitted through the constituent association to the Secretary of the American Medical Association" and place a comma preceding these words where a period now appears

(3) Revise subsection (A) of Section 4, Chapter III, to read '(A) A Member for whom the payment of dues would be a financial hardship, by reason of physical disability or illness A member may also be excused from payment of dues because of financial hardship for other reasons, but these must be set forth by the secretary of the member's component society'

(4) Revise subsection (D) of Section 4, Chapter III, to read '(D) A Member temporarily in the Armed Forces may be excused from the payment of American Medical Association dues, regardless of local dues exemption for the period beginning January 1 or July 1 following the date of the Member's entrance into military service'

5 Amendment of Bylaws to Provide Uniform Nominating Procedure for Members of the Standing Committees (Councils) of the House of Delegates—The Council recommends that members of the Standing Committees of the House of Delegates be elected by the House of Delegates on nominations made by the Board of Trustees in a uniform manner for each Standing Committee To attain this uniformity the Council recommends the following amendments

1 Subsection (A), Section 2, Chapter XI, delete the words "on nomination by the President"

2 Subsection (B), Section 2, Chapter XI, delete the words "on nomination by the Board of Trustees"

3 Subsection (C), Section 2, Chapter XI, delete the words "on nomination by the Board of Trustees"

4 Subsection (D), Section 2, Chapter XI, place a period after the word "Members" in the second line of this paragraph and delete the words "each of whom shall serve for a term" and substitute the words "All members shall be elected by the House of Delegates for terms Delete entire last sentence from this paragraph"

5 Subsection (E), Section 2, Chapter XI, delete the words "on nomination of the Board of Trustees"

6 Subsection (F), Section 2, Chapter XI, shall become Subsection (G) without any change

7 Insert new Subsection (F) as follows "At each annual session the Board of Trustees shall present to the House of Delegates two or more nominations for each vacancy in the Standing Committees (Councils) of the House of Delegates"

8 Subsection (E), Section 1, Chapter XV, delete the entire subsection

6 Revision of the Principles of Medical Ethics—At its meeting in June, 1952, the House of Delegates asked the Council on Constitution and Bylaws to study and evaluate the present Principles of Medical Ethics and report back to the House of Delegates its recommendations Since that meeting many individuals and all of the state and county medical

societies have been asked to make specific recommendations for revision of the Principles of Medical Ethics. In response to these requests, numerous communications have been received, most of which have requested clarification, correction, or deletion of existing provisions of the Principles of Medical Ethics. Many have been general in nature and some have made specific suggestions for achieving certain changes. After serious consideration and considerable discussion the Council has decided that it will not offer any recommendation as to textual revision of the Principles during this session of the House of Delegates. It is felt that more information regarding the opinions of the medical profession should become available before basic changes are made, and it is suggested that such opinions can be made available by direct communication or as resolutions presented to the House of Delegates.

7 Proposed Amendment to Principles of Medical Ethics
—At this session an addition is recommended which it is hoped will facilitate the application of all the Principles without changing the structure or the intent of any. In order to achieve this purpose the Council recommends that the House of Delegates adopt a preamble to replace the quotation from Sir Thomas Percival on the first page, which reads as follows: "These principles are not laws to govern but are principles to guide to correct conduct." Also it is intended to replace the Conclusion on the last page, with the following statement:

These principles are intended to serve the physician as a guide to ethical conduct as he strives to accomplish his prime purpose of serving the common good and improving the health of mankind. They provide a sound basis for solution of many of the problems which arise in his relationship with patients with other physicians and with the public. They are not immutable laws to govern the physician. The ethical practitioner needs no such laws, rather they are standards by which he may determine the propriety of his own conduct. Undoubtedly, interpretation of these principles by an appropriate authority will be required at times as a rule. However the physician who is capable, honest, decent, courteous, vigilant and an observer of the Golden Rule and who conducts his affairs in the light of his own conscientious interpretation of these principles will find no difficulty in the discharge of his professional obligations.

8 The Council will continue to study the numerous problems now on its agenda and hopes to provide recommendations, some of which are now under consideration, which will facilitate the usage of the Principles. At this time the Council is rearranging in more logical sequence the chapters, articles, sections, and paragraphs.

The members of the House are urged to study the Principles and to make recommendations in specific language. It is important that these recommendations be spelled out verbatim, so that, if a given sentence or paragraph is not clear and if alteration is required, the Council may consider the specific language which should be utilized. Some of the sections which are controversial and which merit your study are those pertaining to advertising, public information, rebates and commissions, nonsectarianism, and the purveyance of medical service. The Council anticipates that resolutions bearing on the Principles will be presented at this and future sessions of the House of Delegates and that they will be referred to this Council for consideration. Such measures will be helpful and probably will provide an important method of obtaining information which is needed if our desires are to be fulfilled in a manner which will be acceptable to all.

Report of Reference Committee on Amendments to Constitution and Bylaws

Dr. John W. Green, Chairman, presented the following report, which after discussion and amendment was adopted, as amended, the Speaker declaring in each necessary instance that the Constitution and Bylaws were amended.

Your committee has made use of legal talent and advice and information from Drs. Buie and Schiff and Dr. Cunniffe, as well as several other witnesses, on both positive and negative aspects of the report of the Council on Constitution and Bylaws as well as on the resolutions referred to it. I personally wish to thank all members of the reference committee for their advice and experience, guidance and assistance in writing this report.

Your reference committee approves Item 1 of the Council's report and recommends adoption of the proposed amendment

to Section 4, paragraph (A), Chapter XVI, of the Bylaws. (The House adopted a motion to amend the proposed amendment so that the last sentence was deleted from the paragraph and included as a footnote.)

Your committee approves Item 2 of the report of the Council on Minority Reports of Reference Committees and recommends adoption of the proposed amendment of Section 2, Chapter XII, of the Bylaws.

Item 3 of the Council's report, on Clarification of Section 3, Chapter XII, is approved by your reference committee, and the proposed amendment of this section of the Bylaws is recommended for adoption.

Your committee approves Item 4 of the Council's report, on Amendments Suggested by the Membership and Records Department, except subsection "d," which deletes the phrase "may be excused from payment of American Medical Association dues," so that the section will read as follows: "A member temporarily in the Armed Forces may be excused from the payment of American Medical Association dues, regardless of local dues exemption for the period beginning January 1 or July 1 following the date of the member's entrance into the service."

Your reference committee disapproves Item 5 (a) of the Council's report and the proposed amendment of paragraph (A), Section 2, Chapter XI to provide uniform nominating procedure for members of Standing Committees (Councils) of the House of Delegates.

Item 5 (b), (c), (d), (e), (f), and (h) of the report of the Council are approved by your committee and the proposed amendments to Section 2, Chapter XI, are recommended for adoption.

Your reference committee approves Item 5 (g) of the Council's report, with the following revision. After the words, "House of Delegates," add "except the Judicial Council, and further nominations may be made from the floor of the House of Delegates, except for the Judicial Council."

Your committee approves and commends the activities of the Council on Constitution and Bylaws for its work on the revision of the Principles of Medical Ethics, as set forth in Item 6 of its report.

Report of Reference Committee on Miscellaneous Business

Dr. Walter P. Anderton, Chairman, submitted the following report, which was adopted, and the Speaker declared that the Principles of Medical Ethics were amended.

In reference to the report of Dr. Louis A. Buie, Chairman of the Council on Constitution and Bylaws that portion of the report referred to the Reference Committee on Miscellaneous Business, changing the preamble to the Principles of Medical Ethics and combining it with the conclusion, is approved by your committee and recommended for adoption as the preamble to the revision and streamlining of the Principles of Medical Ethics.

Report of the Council on Medical Education and Hospitals

Dr. H. G. Weiskotten, Chairman, submitted the following report, which was referred to the Reference Committee on Medical Education and Hospitals.

The Council on Medical Education and Hospitals wishes to submit a supplementary report to clarify certain questions that have been raised relative to the development and implementation of the revised Essentials of an Approved Internship that were adopted at the Denver session.

Few problems have given the Council as much concern during recent years as have those relating to the internship and its place in present-day medical education and hospital service. That they have also had the attention of the profession at large is evidenced by the number of resolutions bearing on the subject which annually have been presented to the House. The majority of these resolutions were referred to the Council by the reference committees which considered them with instructions that the contents be given thorough study and that a report be made to the House as to progress in resolving the problems involved. During the past five years two committees of the House specifically appointed for the purpose have

reviewed the general problem and have made recommendations relative to its solution.¹ The Council has made every effort over the past several years to implement these recommendations including that relating to the reappraisal of hospitals approved for intern training.

In the belief that a further comprehensive study of the internship was essential, the Council in the spring of 1951 discussed the possibility of undertaking such a project with the Board of Trustees and reported to the House at its June, 1951, session that the Board had approved the appointment of an Advisory Committee on Internships to the Council and had appropriated funds for a thorough study by this Committee. In commenting on the establishment of this committee, the reference committee at the June, 1951, session stated:

Your committee commends this action of the Board of Trustees and appreciates its implementing appropriation for this much needed evaluation of a multi faceted and important phase of medical education. Your committee further recommends all possible speed compatible with ability to reach sound conclusions and make definite recommendations.

The organization of this committee was completed by September, 1951, with representatives from the major clinical fields, general practice, medical education, and hospital administration. From the outset, the committee pursued its task with unusual vigor and approached the problem confronting it seriously and thoroughly. Appreciating the necessity for objective data on which to base its conclusions and recommendations, it undertook a questionnaire survey of the graduates of the classes of 1937 and 1947. Detailed information was requested from these physicians relative to the internship which they had taken their opinion of its educational value, the important defects of the training which they had received, and many other aspects of the subject. The members of the committee individually sought the advice of many of their professional colleagues and acquaintances on the problems involved. After more than a year of exhaustive investigation and study, the committee was ready to report its findings in November, 1952, in the form of two documents, which were referred to members of the House of Delegates and approved by them at the Denver session. These documents were the revised Essentials of an Approved Internship and the Report of the Advisory Committee on Internships. The Council believes that this committee carried out its responsibilities in a most commendable manner and that its conclusions as reflected in these two statements constitute a milestone in the progress of medical education. That the reference committee which considered them last December concurred in this opinion is reflected in its recommendation to the House, which stated in part as follows:

Your committee has reviewed the 74 page report of the Advisory Committee on Internships with a great deal of interest and wishes to express its feeling of appreciation for the clarity of thought recorded in the counseling that is given to help improve the internship in various sections of the country. Because of this clear presentation your committee is sure that the internship will be improved greatly and that the quality of medical care of patients throughout the country will be markedly improved. Your reference committee heartily endorses the report and suggests that it be made available to every physician and hospital throughout the country.

As suggested by the reference committee, the Essentials and the Report were published in *THE JOURNAL*. Reprints together with a covering letter explaining the application of the revised standards were sent to all hospitals approved for internships. Subsequent to this initial distribution, requests were received and filled for upwards of 5,000 copies of each document. The general response to the findings and conclusions of the Advisory Committee from the profession at large and from those engaged in medical education has been highly laudatory. A number of critical comments have been received in recent weeks, however, based, we believe, on a misunderstanding or misinterpretation of the purposes and applicability of the new requirements, as a result of which the Council has thought it desirable to submit this supplementary report.

The criticisms which have been voiced can be summarized as follows:

1 That the Advisory Committee and the Council are trying to make the internship a fifth year of medical education. This is, in fact, true and represents no change in the expressed

policy of the Council and the House of Delegates. As early as 1925 a statement to that effect appeared in the requirements for internship approval. The following statement is quoted from the Essentials as revised that year:

The hospital through designated members of its staff should provide adequate instruction and experience for the interns who in effect are fifth year medical students in medicine, pediatrics, surgery, obstetrics and laboratory work throughout their terms of service.

In all subsequent revisions of the Essentials, the Council has consistently held to the concept that the internship must be considered primarily as a phase of medical education and has been supported in this view by the House of Delegates. To question the validity of this premise is, in effect, to state that interns are appointed to furnish the medical staff of hospitals with low paid help. The implications of regimentation and exploitation inherent in such a policy are obvious.

The Council has appreciated, however, that there is and properly should be, a service aspect to the internship. In this connection, the following statement from the Advisory Committee's report may be considered as reflecting the Council's position:

We do not mean that the hospital which offers outstanding educational opportunity to the intern should receive no service from the intern in return. We do mean that when education is the primary emphasis, excellent service as a rule goes along with it for the essence of medicine at its best includes service in every aspect. However, whereas education in medicine implies service, service in medicine does not necessarily imply education and in practice where a hospital is out for interns to get its work done in any conflict between service and education, service usually wins to the detriment of the educational opportunity.

2 The second criticism that has been advanced contends that the revised Essentials are discriminatory against smaller hospitals. The Council does not believe that this criticism is justified. The qualitative requirements for approval are applicable in equal force for all hospitals approved for internships. To state that the smaller hospital is unable to meet these requirements is to admit that it is not able to conduct an intern program of satisfactory quality. In point of fact, many smaller hospitals can and do offer outstanding intern programs and regularly attract full intern staffs.

It is true that the quantitative standards relative to bed capacity, annual admissions and autopsy rate have been raised. The Council believes that its minimum requirements in this respect are reasonable and necessary to insure that the intern receives a sufficiently broad and varied experience during the course of his training. It does not consider that it is any more difficult for a smaller hospital with relatively few deaths to meet the present autopsy requirement than it is for a large hospital with comparatively many deaths. In point of fact, it may be more difficult for the latter group to maintain the same percentage since the actual work load on the department will be appreciably greater.

It should be noted that the revised quantitative requirements as to bed capacity and annual admissions are applicable *only* to those hospitals newly applying for approval after January 1, 1953, and do *not* apply to hospitals that had been approved by the Council before that date. It is felt that this fact has not been sufficiently well understood, with the result that the criticism has been raised that smaller hospitals have been discriminated against.

3 The third criticism which has been raised is that the two-thirds provision relative to the intern complement in an approved hospital is discriminatory, again to the disadvantage of the smaller hospital. In actuality, it may prove more difficult for the larger hospitals to meet this requirement than for the smaller hospitals which seek to appoint relatively few interns. In adopting this provision, the Council was, however, primarily concerned with the interests of the intern. The excessive demands on an intern's time and energy in a hospital whose intern staff is markedly below its normal complement are almost certain to prevent the intern's receiving a well rounded training.

The House on several occasions has requested the Council to resolve the problems resulting from the disparity between

¹ Committee on Intern Placement (William Bates, Chairman) 1948 and Committee on Training of Interns (Joseph F. Londrigan, Chairman) 1950.

the number of internships offered in approved hospitals and the number of applicants available to fill them. The House may recall that three years ago an attempt was made to have the hospitals throughout the country reduce the number of internship positions through voluntary acceptance of an intern quota. The results of this proposal were entirely unsuccessful, owing, we believe, in large measure to the fact that resident staffs were being depleted as a result of the Korean war with a consequent increased demand for interns. Serious consideration was given to a suggestion that the Council set a specific limit for each hospital as to the number of internships it would be permitted to offer. It was felt, however, that the practical problems involved in arriving at a determination of such a number as well as the difficulty of defending a figure which of necessity would be somewhat arbitrary, made the proposal unworkable, e. g., limiting the number of internships to 10 if the hospital were to request 12. Further, there are legal implications to such a policy which make its adoption inadvisable. The Advisory Committee and, subsequently, the Council have given serious consideration to the necessity of adopting the two-thirds requirement. It was the consensus of both groups that some measure had to be taken to prevent further inflation of the demand for interns and to bring the number of internships into closer balance with the number of applicants. The present requirement places the matter on a self-regulatory basis rather than on an arbitrarily imposed quota. It is our firm belief that adherence to this policy will result in a more realistic appraisal by individual hospitals of their needs for interns and that there will be a lowering of the number of internships offered by hospitals throughout the country with a consequent amelioration of many of the problems resulting from the present imbalance. Again, we would like to quote from the report of the Advisory Committee as it bears on this point:

There is one requirement which is new in kind. Any internship program which in two successive years does not obtain two-thirds of its stated intern complement is disapproved for internship training. This is based on the clear-cut fact that no matter how good the internship looks on paper, how rich its patient material and extensive its laboratories or how well known its attending staff, an intern cannot get what he needs if a short-handed house staff results in such a load of routine work that he has no time for the educational aspects of his experience.

We do not anticipate that many hospitals will be disqualified on this account. Rather we expect that hospitals which are failing to meet their internship quota by a large margin will engage in a careful self-scrutiny as to whether their internship program as planned is working out in practice. We also anticipate that hospitals may avoid disqualification by voluntarily reducing their intern quota and at the same time reducing the number of beds for which interns are expected to take responsibility. Beds removed from the intern scope will not count toward the minimum number of beds required for approval. The removal of such beds (e. g. in wards devoted to research or to a single-type of chronic disease in a private pavilion where an attending or courtesy staff are not interested in teaching) from the sphere of intern work may have the double effect of making a hospital's internship more attractive and reducing the national discrepancy between available internships and available interns.

4 The fourth criticism advanced is that the establishment and enforcement of the Essentials constitutes regimentation of the profession. This is a criticism which the Council would consider as serious if it were not unfounded. The Council is charged by the House of Delegates with the responsibility for establishing adequate standards for all phases of medical education and has done so for the past forty years. The present revision of the Essentials does not differ in principle from the first Essentials adopted by the House in 1919. The purpose of these Essentials is to serve as a guide to medical staffs in hospitals throughout the country in organizing and conducting an approved intern program. A continuing effort has been made by the Council in the past as at present to improve the quality of this phase of medical education just as it has striven to improve medical education at the undergraduate level. To state that the adoption of and adherence to such standards constitutes regimentation is to imply that the efforts of the American Medical Association during the past forty years to raise the level of medical education in this country to its present point of unsurpassed excellence, have been misguided.

It is somewhat unusual for the Council to submit to the House a report of this nature. The Council has felt it important to do so, however, because of the widespread circulation which has been given to the criticisms enumerated in this state-

ment. We have gone into some detail in replying to these criticisms in order to clarify the Council's position and to present for the information of the House additional background material relative to the preparation of the present Essentials of an Approved Internship and an explanation of their application.

ESSENTIALS FOR THE TRAINING OF MEDICAL RECORD TECHNICIANS

PREAMBLE

The Council on Medical Education and Hospitals of the American Medical Association, in cooperation with the American Association of Medical Record Librarians, has established standards for the training of medical record librarians. As sufficient personnel is not available in this field, additional standards have been prepared for the training of medical record technicians who working under the supervision of a qualified medical record librarian or a medical record committee, perform the technical tasks associated with the maintenance and custody of medical records. The Council establishes standards, inspects, and approves training programs, and publishes lists of acceptable courses. The American Association of Medical Record Librarians is concerned with the promotion of educational activities and the registration of qualified record personnel.

The following standards have been established for the information of hospitals, prospective students, physicians, and educational directors and for the protection of the public.

I ADMINISTRATION

1 Acceptable courses for the training of medical record technicians may be conducted by general hospitals having adequate teaching material and personnel. Hospitals may, if they so desire, establish affiliations with accredited educational institutions.

2 Resources for the continued operation of acceptable training programs should be available through regular budgets, gifts or endowments but may be obtained in part through students' fees. Exorbitant fees or commercial advertising are considered unacceptable.

3 Training programs conducted primarily for the purpose of substituting students for paid record personnel will not be considered for approval.

II ORGANIZATION

4 Adequate space, light, and equipment should be available for the general and educational activities of the hospital departments used in the training of medical record technicians. A library containing suitable references, texts and periodicals should be readily accessible to the students.

5 The medical record department should maintain numeric files of all patients' medical records, alphabetically or phonetically filed patients' indexes, statistical data on births, deaths and autopsies, diagnostic, operative, and physicians' indexes. A modern system of indexing should be employed with supplemental classifications and files for teaching and demonstration purposes. These should include serial and unit number systems, a phonetic file, and disease and operative indexes based on the Standard Nomenclature of Diseases and Operations.

6 A record of the curriculum, syllabus, teaching plans and a procedure book should be available. Transcripts of the students' prerequisite training should be filed in the department. To these should be added the details of attendance and grades as well as a list of the experiences obtained by individual students.

7 A minimum of two students should be in training. However, the maximum number admitted for practical instruction should be determined by the amount of available space, teaching material and properly qualified instructors.

III FACULTY

8 A competent teaching staff should be assigned to the training program. The director shall be (1) a qualified medical record librarian, registered or eligible for registration, who has at least one-half the credits necessary for an academic degree from an accredited university or college and five years' experience in charge of a medical record department in an

approved hospital, or (2) a medical record librarian having equivalent educational qualifications and experience

9 An adequate number of instructors should be available so that students may have immediate guidance and supervision in their various assignments

IV ADMISSION REQUIREMENTS

10 Candidates for admission should be proficient in typing and preferably also in shorthand. They should have completed the requirements for high school graduation or should have passed a college entrance examination for admission to an accredited college or university

11 All applicants should be required to submit a physical health report including record of vaccination. All students should be given a medical examination as soon as practicable after admission and this examination should include an x ray of the chest

V CURRICULUM

12 The course of training should include not less than nine months of theoretical instruction and practical hospital experience

13 Theoretical instruction may be presented by informal conference or formal lectures and should include

Subject	Clock Hours
Anatomy	40
Medical terminology	30
Prefixes suffixes roots abbreviations disease operative and drug terms	
Medical records	60
Securing preserving usage supervision in indexes statistics medicolegal ethics	
Total clock hours	130

14 Practical training should involve the following activities associated with medical records

1 Orientation	1 week
2. Admitting procedure	
(a) Admitting office	4 weeks
Authorization for admission interview and recording of sociological data assignment of hospital number admission forms and patients register	
(b) Medical record department	8 weeks
Preparation of index card and chart folder correlation with previous records daily census birth and death certificates	
3 Discharge procedures	20 weeks
Assembling medical records checking completeness daily analysis referral to record committee indexing—diagnostic operative physicians patients—monthly and annual reports filing release of information to outside agencies	
4 Secretarial practice	4 weeks
Including relationships to x ray laboratory surgical and outpatient departments	

VI CLINICAL MATERIAL

15 The training of medical record technicians should be conducted in acceptable general hospitals having a minimum of 4,000 annual admissions. These admissions should include an adequate distribution of patients in the various clinical services commonly found in general hospitals

VII ADMISSION TO THE APPROVED LIST

16 Application for approval of a course for medical record technicians should be made to the Council on Medical Education and Hospitals of the American Medical Association, 535 North Dearborn Street, Chicago 10, Ill. Forms will be supplied for this purpose on request. Inquiries regarding the registration of qualified medical record personnel should be addressed to the American Association of Medical Record Librarians, 510 North Dearborn Street, Chicago 10, Ill.

17 Approval may be withdrawn whenever in the opinion of the Council the course is not maintained in accordance with the above standards. Whenever a training program has not been in operation for a period of two consecutive years approval may also be withdrawn

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, presented the following report, which was adopted

Report of Council on Medical Education and Hospitals. The special report of the Council on Medical Education and Hospitals is a document explaining its point of view relative to the development and implementation of the revised Essentials of an Approved Internship that were adopted at the Denver session in 1952. Your reference committee agrees that from the point of view of the Council it is a lucid explanation of some of the criticisms. Your reference committee recommends its approval. Your reference committee suggests that when the Council on Medical Education and Hospitals has any revolutionary changes in its program to be presented to the House it send a copy of such proposal to each delegate at least 30 days in advance.

Essentials for the Training of Medical Record Technicians Prepared by the Council on Medical Education and Hospitals—The Council reports the establishment of standards for the training of medical record technicians as distinguished from medical record librarians, the standards being much more flexible and less demanding in an effort to obtain a larger number of medical record workers to perform the technical tasks concerned with the maintenance and custody of medical records. While your reference committee approves this report and its recommendation, it was felt that very few members of the House of Delegates have read it or have had time to discuss it. Your reference committee, therefore, recommends at this time temporary approval of the proposed Essentials as presented in order that schools can be started in September, but refers it for further consideration and final action at the December session of the House of Delegates.

Report and Supplementary Report of Committee on Blood

Dr Herbert P Ramsey, Co-Chairman, presented the following report of the Committee on Blood, which was referred to the Reference Committee on Miscellaneous Business

Defense and Civilian Defense Blood Procurement—During the year 1952, a total of 2,459,868 pints of blood were collected for defense and civilian defense purposes. Red Cross regional and defense centers collected 2,017,101 pints of this total, and cooperating private blood banks collected 442,767 pints. The Committee on Blood called the attention of the Advertising Council, Inc., which is acting as the publicity medium for the National Blood Program, to the substantial contribution of private blood banks to the defense effort. The Advertising Council, in recognition of this effort, has added the following statement to all its media including publications, television, and radio: "Call your Red Cross Chapter or local Blood Donor Center." From present indications, it will be necessary to increase collections of blood to 3 million pints during the fiscal year of 1953 for defense purposes alone.

Civilian Blood Procurement and Usage—One source of information regarding civilian blood procurement and usage is the American National Red Cross data which indicate that during 1952 the American Red Cross distributed 1,681,775 pints of blood to hospitals in the United States. Of this quantity, 1,453,645 pints actually were utilized for blood transfusions and 228,130 pints were returned as outdated. This is about a two and one half times increase over the amount of blood furnished by the Red Cross in 1949. The civilian totals include 90,065 pints of blood used in 73 Veterans' Administration hospitals, 55 Army hospitals, 12 Navy hospitals, 20 Air Force Base hospitals, 8 Public Health Service hospitals, 3 Indian hospitals, and 8 prison hospitals.

A second source of information is the questionnaire included in the schedule of the 1952 Annual Census of Hospitals by the Bureau of Medical Economic Research of the American Medical Association. The report of the Bureau of Medical Economic Research on this questionnaire deals with these problems in detail.

Blood Fractions—Greater emphasis on serum albumin production for use in the therapy of shock has resulted from the continued incidence of infectious hepatitis in patients receiving

ing plasma transfusions Preliminary experiments seem to indicate that, in the process of separating serum albumin, the virus of infectious hepatitis is either destroyed or is not carried with the fraction The Department of Defense has agreed to accept all serum albumin produced as a result of the processing of human plasma into gamma globulin and to pay roughly 60% of the cost of the total processing The American National Red Cross has undertaken to pay the remaining 40% of the cost

Because of the tremendous interest in the problem of poliomyelitis and the undoubted demand which would exceed the foreseeable supply, the Office of Defense Mobilization, through its Subcommittee on Blood, agreed to act as an allocation mechanism for the distribution of existing supplies of gamma globulin The National Foundation for Infantile Paralysis has contracted for the entire commercial output of gamma globulin whether manufactured from human placentas or from whole blood procured by pharmaceutical firms This supply will be placed in the national pool together with the supply from the Red Cross In February, the U S Navy turned over to the Red Cross a supply of 460,000 grams of war surplus gamma globulin in dried form

In formulating the policies for gamma globulin allocation and distribution, the Office of Defense Mobilization secured the advice of an Ad Hoc Committee of the National Research Council The following allocations program was adopted

Gamma globulin for the prophylaxis of measles and infectious hepatitis will be packaged in 2 cc vials Gamma globulin for the prophylaxis of poliomyelitis will carry a special label identifying it as suitable for such use In order to comply with regulations of the National Institutes of Health, such gamma globulin must be tested in animals for presence of protective antibodies against the Lansing virus It is to be packaged in 10 cc vials

Allocation for Measles and Infectious Hepatitis—The allocation made to states and territories for prophylaxis against measles and infectious hepatitis was based on the five-year (1947-1951) median incidence for measles The number of cases was multiplied by a factor of 1.5, but no state or territory would receive less than the mean annual distribution of Red Cross gamma globulin for this purpose during the same five year period The reported incidence of measles in the states and territories was to be reviewed at monthly intervals and supplementary allocations were to be made available on the basis of unusual measles morbidity In Louisiana, the incidence of measles this year has exceeded the five year median, and difficulties with the allocation program have occurred in some areas The Committee on Blood wishes to reaffirm the position taken in previous reports, and concurred in by the House of Delegates, that gamma globulin for the prophylaxis of measles and infectious hepatitis be made freely available to practicing physicians

Allocations for Poliomyelitis—Approximately 57% of the total remaining supply of gamma globulin in the pool was distributed to the state and territorial health departments based on their past and current experience with poliomyelitis about May 1, 1953 A reserve of 33% has been retained by the National Allocating Authority for mass community prophylaxis and an additional contingency reserve of 10% has been set aside for unusual emergency purposes Under the plan adopted, the state or territorial health officers will decide the mode of prophylaxis most appropriate for use within their jurisdiction

Basic Allocation—In the basic allocation for poliomyelitis prophylaxis, the amount sent was the product of 60 cc (sufficient to treat six average contacts) and the average of the number of cases of poliomyelitis reported annually in the area for the five year period 1947-1951

Additional Allocations—After the first of May, states and territories are to receive at appropriate intervals additional allocations of 60 cc for each reported case in excess of the mean cumulative annual incidence for the same seasonal period States have been requested to report their current experience in terms of paralytic and nonparalytic poliomyelitis This has been requested so that adjustment may be made in

the form of additional allocations to meet the threat of a high ratio of paralytic cases of poliomyelitis in an area

Supplementary Allocations—About the first of July and at biweekly intervals thereafter until October 1, supplementary allocations of gamma globulin will be made to states and territories at a level designed to distribute all available gamma globulin for this purpose by the first of October This allocation to the states and territories will be proportional to their reported morbidity

Mass Community Prophylaxis—Special allocations from the reserve retained by the national allocating authority for mass prophylaxis will be made available only on application by the state or territorial Health Officer The Public Health Service has accepted the responsibility for distributing gamma globulin in accordance with the above policies

The National Foundation for Infantile Paralysis is not in full sympathy with the plan outlined It feels that gamma globulin, when administered during an epidemic of poliomyelitis to persons in those age groups subject to greatest risk, provides some temporary protection against the paralytic form of the disease Further, that most contacts of cases with poliomyelitis are already infected with the virus for several days by the time the first case in a family is diagnosed They feel that by that time the disease may have advanced beyond the point where gamma globulin can prevent paralysis For these reasons, the National Foundation's Advisory Committees on Research and Education recommended that the major portion of the nation's stockpile of gamma globulin, available for use in poliomyelitis, be reserved for mass injections of children in the most severe poliomyelitis epidemics of 1953 However, this opinion has not changed the allocation program as it was outlined above

Blood Substitutes—Dextran now appears to be leading the field of the various plasma substitutes available Initial experimentation with dextran from European sources produced allergic type side reactions However, the reaction rate for a dextran developed in this country is low In general, it has been found that molecular weight and size are the critical factors since a definite renal threshold to dextran exists Preliminary reports on field trials indicate that this form of dextran is a satisfactory plasma substitute Experiments continue on polyvinylpyrrolidone (PVP) to determine its exact route of distribution and excretion

State Committee Data—In answer to a questionnaire mailed to the state societies, 28 states and the District of Columbia indicated that they had existing Blood Bank Committees, 3 states were considering organization of such committees, and 16 states and the Territory of Hawaii had no committees The data is to be analyzed more fully and will be the subject of a report and recommendations in the near future

Fact Finding Committees—During the period since the last report of the Committee on Blood to the House of Delegates, problems arose in California and Miami, Florida, in which intervention of a fact-finding committee was requested by the state or local medical society In the case of California, both the Pacific Area Red Cross and the California Medical Association Blood Bank Commission requested assistance in the settlement of territorial disputes which were interfering with the collection of blood in Northeastern California and Western Nevada A joint committee made up of members of the Committee on Blood of the American Medical Association and the American National Red Cross investigated the situation and negotiated an agreement on a statement of principles toward whose achievement the American Red Cross, Pacific Area and the California Medical Association Blood Bank Commission should strive This was signed by the Chairman of the California Medical Association Blood Bank Commission and the Manager of the American National Red Cross, Pacific Area

In this agreement, the principle of local determination by county medical societies of the type of blood banking facilities to service their areas was reemphasized and the principles outlined were made subject to local society approval In Miami, Fla., a situation had arisen wherein the Blood Bank of Dade County, Inc., and blood banks operated within

Dade County by hospitals had come into conflict over variations in their blood replacement requirements, service charges and policies. The Dade County Medical Association, Inc., the Blood Bank of Dade County, Inc., and the hospital authorities requested the intercession of a fact-finding committee. Representatives from the American Medical Association Committee on Blood, the American Hospital Association, and the American Association of Blood Banks visited the area and succeeded in securing an agreement which was signed by representatives of all the agencies involved in the blood collection program in Dade County.

Committee on Blood Offices—The Committee on Blood Offices are now in the headquarters building of the American Medical Association, 535 North Dearborn Street, Chicago 10, Ill., Dr. Paul L. Wermer, Secretary.

SUPPLEMENTARY REPORT

Survey of Blood Banks—The Bureau of Medical Economic Research, after analyzing the answers to the blood bank questionnaire included in the last annual census of hospitals, has furnished the following summary of blood procurement and usage for 1952.

1952 Blood Bank Survey

A Procurement of Whole Blood				1949 Survey (Bull. 53)			
		000 s Units (Banks)		000 s Units (Banks)			
1	Hospital banks	(1 301)	1,800 48%	1,000	(1 403)	53%	
1a	Direct transfusions		177 4%	500		17%	
2	Non hospital banks	(70)	594 14%	400	(62)	13%	
3	Red Cross regional centers	(46)	1 017 89%	500	(31)	17%	
			4 103 100%	3 000		100%	
B Disposition of Whole Blood Procured							
4	Administered in 5,430 replying registered hospitals		8,584				
5	Administered in 1 303 non replying registered hospitals—estimated		64				
6	Administered in non registered hospitals etc.—Estimated		168 (R C reported 112)				
Total administered			8 816				
7	Outdated blood—estimated		877 (R C reported 228)				
			4,193				

The Committee wishes to express its thanks to Drs. Frank G. Dickinson and Charles E. Bradley for their analysis of these data.

National Blood Program—The Committee believes that it is imperative to proceed immediately with further exploration into the future of the blood collection program. It requests that the Committee on Blood be authorized to confer not only with the American National Red Cross, as noted in the last report to the House of Delegates, but also with other interested major national professional organizations, with a view toward evaluation at the earliest possible date of a practical plan for a continuing national blood program—a plan which will command general endorsement and support, and which will incorporate the sound principles already enunciated by the House of Delegates.

Report of Reference Committee on Miscellaneous Business

Dr. Walter P. Anderton, Chairman, presented the following report, which was adopted:

Your reference committee recommends the acceptance of the report and supplementary report of the Committee on Blood, but has suggested the following changes in the supplementary report:

Under the heading "Survey of Blood Banks" after "1952" at the end of the first paragraph, insert in parentheses the words, "exclusive of defense and civil defense collections." In the tabulation under the heading, "1952 Blood Bank Survey,"

change the words after "1a" from "direct transfusions" to "immediate transfusions." Under the heading "National Blood Program," change the words "professional organizations" in the second sentence to "medical organizations."

Report of Council on Medical Service

Dr. Elmer Hess, Chairman, submitted the following report, which was referred to the Reference Committee on Insurance and Medical Service:

TITLES OF COMMITTEES TO HEAR COMPLAINTS FROM THE PUBLIC

In June, 1952, the following resolution was presented to the House of Delegates by J. F. Shuffield, Arkansas:

WHEREAS The name Grievance Committee carries a certain opprobrium and might be misleading in the eyes of the public and

WHEREAS The work to be accomplished by this committee is to foster better public relations giving the public knowledge and information that a committee exists to settle any differences that might arise between the patient and his physician and

WHEREAS The name Professional Relations Committee is readily recognized as being a committee to settle such difficulties therefore be it

Resolved That the name Grievance Committee be changed to Professional Relations Committee

The House of Delegates voted to lay the resolution over until the December, 1952, session. In December the Reference Committee on Miscellaneous Business presented the following report, which was adopted:

Your committee disapproves the Resolution on Change in Name of Grievance Committee because this House cannot dictate what names state and county medical societies shall give to their committees and further it believes that grievance is the word most readily understood by the laity. It recommends that the Council on Medical Service continue to study the matter of names and bring in a report to this House at the June meeting.

To follow through on this resolution the Council on Medical Service in its biannual Survey of County Medical Society Activities, mailed February, 1953, included a question concerning committees to handle public complaints. As of May 25, 826 replies (compared to a total of 757 replies received in 1951) have been received. Of this number, 416 societies indicate they have committees for hearing complaints from the

TABLE 1—Nomenclature of Committees to Hear Public Complaints

Name	No of Societies Using Title*
Grievance Committee	244
Board of Censors	40
Public Relations Committee	33
Mediation Committee	22
Judicial or Judiciary Committee	12
Executive Committee (of Society)	8
Professional Relations Committee	7
Public Service Committee	5
Board of Directors (of Society)	4
Ethics Committee	4
Board of Appeals	3
Professional Conduct Committee	3
Adjudication Committee	2
Committee Minora (of Society)	2
Ethics and Mediation Committee	2

* The following titles are found but once: Adjudication and Censors Committee; Board of Appeals on Physician Patient Relations; Board of Governors; Committee on Hospital and Professional Relations; Committee on Patient Grievances; Coordinating Committee; Fee Complaint Committee; Grievance and Mediation Committee; Hearing Complaints Committee; Hospital and Medical Practice Committee; Medical Economics Committee; Medical Ethics and Department Committee; Medical Relations Committee; Board of Supervisors; Censor Committee; Committee on Ethics and Department; Mispractice Committee; Patient Relations Committee; Physician Hospital Relations Committee; Physician Patients Relations Committee; Professional Ethics Committee; Protest Committee; Publicity and Public Relations Committee; Public Policy and Relations Committee; Public Relations and Grievance Committee.

public, 408 societies have no such committees, and 2 societies report such committees are under consideration. Among the 416 societies with committees, the title "grievance committee" is used by 244 societies. Other titles are used by 172 societies, with "Board of Censors" used by 40 societies, "Public Relations Committee" by 33 societies, and "Mediation Committee" by 22 societies. The only other title used by more than 10

medical societies is "Judicial" or "Judiciary Committee," which is found listed 12 times. The survey has revealed that 35 other names are used as titles for these committees, three of which are used by from 5 to 9 societies and 7 by from 2 to 4 societies. The remaining 25 titles are found only once.

The list of titles used and frequency with which they occur are shown in the accompanying table 1.

While the title 'grievance committee' is used by many more societies than any other single title, it occurs more frequently among the smaller societies. This is shown in table 2.

TABLE 2—Titles by Size of Society

	Grievance Committee	Other Titles*
Societies with less than 100 members	182	90
Societies with more than 100 members	62	77

* Other Titles here indicate a variety of names (see table 1) and seem to show that while the larger societies may not prefer to use grievance committee they are far from agreed on an acceptable substitute. In fact the only 'other' titles used by more than four of the larger county societies (over 100 members) are Board of Censors by 14 societies, Judicial Committee by 10 societies, Mediation Committee by 9 societies and Public Relations Committee by 7 societies.

Since 62 of the larger societies use the name "Grievance Committee," it is evident that even among this group the "grievance" title continues most popular.

A review of the titles used by the state medical associations shows a similar wide divergence of choices as to names for these committees. Again the title used most is 'grievance committee' (by 23 associations), with 13 other titles divided among 17 states, with 'Board of Supervisors' used in 3 of these states and 'Mediation Committee' in 2 of them. The councils of the state associations handle this function in 6 states. Referring back to the resolution, it is evident that few medical societies prefer the title of 'Professional Relations Committee' for such committees.

The Council on Medical Service is in full agreement with the suggestion of the reference committee that the "House cannot dictate what names state and county medical societies shall give to their committees." The Council would like to call to the attention of the House of Delegates that there is a distinction between the functions of grievance committees and committees on medical ethics, which should not be confused. The Council has used the title 'Grievance Committee' on its reports on this subject and will continue to do so unless otherwise instructed by the House of Delegates.

Report of Reference Committee on Insurance and Medical Service

Dr Gerald V. Caughlan, Chairman, presented the following report, which was adopted:

Report of the Council on Medical Service Regarding the Designation of Titles of Committees to Hear Complaints from the Public. Many societies use the term 'grievance committees' while others use different designations. The Council on Medical Service believes that the House of Delegates cannot dictate what names state and county medical societies shall give to their committees and calls attention of the House to the fact that there is a distinction between the functions of grievance committees and committees on medical ethics, which should not be confused. Your committee is favorable to the report of the Council on Medical Service as to titles.

Report of Committee on General Practice Prior to Specialization

Dr A. C. Scott Jr., Chairman, presented the following report, which was referred to the Reference Committee on Medical Education and Hospitals:

The Committee on General Practice Prior to Specialization, which was appointed on May 1, 1953, met in New York on May 31 for an organizational meeting, with four members present. The President of the Association, Dr. Bauer, was in-

cluded because of his great interest in the subject, and he participated in the committee's deliberations.

General plans were agreed on for methods of study of the problem, for future meetings, for objectives to be attained, and for conferences with the Council on Medical Education and Hospitals and the various specialty boards.

It was agreed by all members present that the principal objectives sought, and which the Committee would endeavor to attain if permitted by the House to pursue its plans for another two years, are (1) a broadened base of education in the art of medical practice for all doctors entering specialization, and (2) a better distribution of doctors between urban and rural areas.

The Committee requests that the House of Delegates make this a continuing committee to study these problems further and to make periodic reports to the House from time to time. Respectfully submitted,

A. C. SCOTT JR., Chairman
ELI S. JONES
DAVID B. ALLMAN
F. J. L. BLASINGAME

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B. Wright, Chairman, presented the following report, which was adopted:

Report of the Committee on General Practice Prior to Specialization Concerning Organizational Meeting and Program.—Your reference committee recommends that the House of Delegates make this a continuing committee for another two years of study and to make periodic reports to the House from time to time. Your reference committee recommends that the report of this committee be approved.

Resolutions on Nominations to Standing Committees (Councils) of the House of Delegates

Dr Ralph A. Johnson, for the Michigan delegation, introduced the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and Bylaws:

WHEREAS Certain Standing Committees now designated as Councils were created by and made responsible to the House of Delegates of the American Medical Association and

WHEREAS No means are now provided for making nomination to these committees by members of this House therefore be it

Resolved That in addition to the manner of nominating as now provided nominations to these committees except to the Judicial Council be permitted by any member of the House of Delegates and be it further

Resolved That appropriate changes in the Bylaws be hereby adopted to carry out the purpose of these resolutions in accordance with the proposed amendments hereto attached

Chapter XI Section 2 Paragraph (B) Omit the phrase 'on nomination by the Board of Trustees' and insert the sentence 'Nominations shall be made by the Board of Trustees and may be made from the floor of the House of Delegates.' Chapter XI Section 2 Paragraph (B) will then read as follows: The Council on Scientific Assembly shall consist of seven Active or Service Members one of whom shall be a general practitioner. All members shall be elected by the House of Delegates for terms of five years so arranged that at two annual sessions the terms of two members expire and at three annual sessions the term of one member expires. Nominations shall be made by the Board of Trustees and may be made from the floor of the House of Delegates. The members of the Council on Scientific Assembly shall be chosen as far as practicable from the past section officers representing different sections. The President Elect shall be an ex-officio member of the Council on Scientific Assembly without vote.

Chapter XI Section 2 Paragraph (C) Omit the phrase 'on nomination by the Board of Trustees' and insert the sentence 'Nominations shall be made from the floor of the House of Delegates.' Chapter XI Section 2 Paragraph (C) will then read as follows: The Council on Medical Education and Hospitals shall consist of ten Active or Service Members one of whom shall be a private practitioner of medicine who is not a faculty member of a medical school or a member of a staff of a hospital associated with a medical school or university. Members of the Council shall be elected by the House of Delegates for terms of five years, so arranged that at each annual session the terms of two members shall expire. Nominations shall be made by the Board of Trustees and may be made from the floor of the House of Delegates.

Chapter XI Section 2 Paragraph (D) Omit the phrase 'and the House of Delegates shall elect from' and insert the sentence 'Nominations may also be made from the floor. The House of Delegates shall elect from

these nominations Chapter XI Section 2 Paragraph (D) will then read as follows 'The Council on Medical Service shall include six Active or Service Members each of whom shall serve for a term of five years so arranged that at one annual session the terms of two members expire and at four annual sessions the term of one member expires In addition the President the Immediate Past President and a member of the Board of Trustees selected by the Board shall be members of the Council except that the President and the trustee member shall be ex-officio members without vote At each annual session the Board of Trustees shall present to the House of Delegates three nominations for each vacancy Nominations may also be made from the floor The House of Delegates shall elect from these nominations

Chapter XI Section 2 Paragraph (E) Omit the phrase on nomination by the Board of Trustees and insert the sentence Nominations shall be made by the Board of Trustees and may be made from the floor of the House of Delegates Chapter XI Section 2 Paragraph (E) will then read as follows 'The Council on Constitution and By Laws shall consist of five Active or Service Members elected by the House of Delegates for terms of five years so arranged that at each annual session the term of one member expires Nomination shall be made by the Board of Trustees and may be made from the floor of the House of Delegates The President Secretary Assistant Secretary a member of the Board of Trustees selected by the Board and the Speaker and Vice Speaker of the House of Delegates shall be ex-officio members of the Council without the right to vote

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, submitted the following report, which was adopted

Resolutions on Nominations to Standing Committees (Councils) of the House of Delegates All the recommendations in these resolutions concerning nominations to the Councils of the House of Delegates have been covered in the reference committee report on the report of the Council on Constitution and Bylaws whereby provision has been made for nominations from the floor of the House of Delegates for members of the various Councils, except those for the Judicial Council Therefore, your committee recommends no action on the Michigan resolution

Proposed Amendment to Bylaws, Chapter IV, Concerning Power of Judicial Council

Dr Joseph D McCarthy, Nebraska, presented the following proposed amendment to the Bylaws, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws

Amend Paragraph 1 of Chapter IV Disciplinary Action to be known as Section 1 and add Section 2 which will read as follows

Section 2 The Judicial Council after due notice and hearing may censure suspend or expel any Associate Service or Affiliate Member of the American Medical Association for an infraction of the Constitution or these Bylaws or for a violation of the Principles of Medical Ethics

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, submitted the following report, which was adopted

Proposed Amendment to Chapter IV of the Bylaws Your committee approves this proposed amendment, because at present there is no provision in the Constitution and Bylaws for the Judicial Council to have original jurisdiction over members of the American Medical Association who are not members of their component county and constituent state medical societies Your committee recommends the adoption of this amendment, with the following changes (1) Eliminate the word associate and add the word 'honorary' after the word affiliate, so that Chapter IV—Disciplinary Action, Section 1, remains as at present, and so that new Section 2, shall read as follows 'The Judicial Council, after due notice and hearing, may censure, suspend or expel any Service, Affiliate or Honorary Member of the Association for an infraction of the Constitution or these Bylaws, or for a violation of the Principles of Medical Ethics' Your committee recommends its adoption as amended

Your committee also recommends that this be referred to the Council on Constitution and Bylaws for implementation

Resolutions on Department of Health, Education and Welfare, and Social Security System and Program

The five following resolutions, similar in content, were referred to the Reference Committee on Miscellaneous Business The reference committee did not report on these resolutions (The report of the Reference Committee on Insurance and Medical Service on the report of the Board of Trustees having to do with the Resolution on Responsibility of the Government in the Medical Care of the Citizen, which will be found on page 733 of THE JOURNAL for June 20, 1953, pertains to the subject matter of these five resolutions)

1 Resolutions on Department of Health, Education, and Welfare

Dr J Lafe Ludwig, California, presented the following resolutions

WHEREAS Every American physician has a double interest in the newly created Department of Health Education and Welfare because it affects him professionally and as a citizen therefore be it

Resolved That this House of Delegates urge the Congress of the United States to speed and accelerate in every manner possible a thoroughgoing investigation of the entire social security program to the end that it may be placed on a sound actuarial basis and be it further

Resolved That a copy of this resolution be sent to the President of the United States to the members of the Cabinet and to each member of the Congress

2 Resolution on Social Security System

Dr William Weston, South Carolina, introduced the following resolution

Resolved That the South Carolina Medical Association, in regular session assembled on May 6 1953 instruct its delegates to present a resolution to the House of Delegates of the American Medical Association urging that body to endorse and to cooperate in if possible a full study of the present Social Security System and endeavor to work out a plan whereby it can be established and operated on a sound financial and actuarial basis

3 Resolution on Social Security System

Dr Willard A Wright, North Dakota, presented a resolution, as follows

WHEREAS It is the announced intention of the Department of Health Education and Welfare to support legislation which will have the effect of forcing self-employed persons into the Social Security System and

WHEREAS, The vast majority of members of the American Medical Association do not desire to be taxed for this purpose and

WHEREAS We have in the past registered our disapproval of this proposal now therefore be it

Resolved That the House of Delegates of the American Medical Association reaffirm its faith in the responsibility of the individual to make proper provision for himself and record its opposition to compulsory participation in the Social Security System by physicians

4 Resolutions on Social Security Program

Dr Harlan English, Illinois, introduced the following resolutions

WHEREAS There is a growing sentiment throughout the nation that the present Social Security program is basically wrong and should be repealed or revised and

WHEREAS Some of its principal faults are (A) It destroys ambition of the individual and encourages governmental paternalism (B) It withholds benefits from those reaching the eligible age of 65 unless the beneficiary limits his earned income to not more than \$75.00 per month (C) As more and more old people become eligible for Social Security benefits the government will be forced to tax again to meet its Social Security obligations because the taxes collected to finance the benefits have been spent for other purposes and the so-called Social Security Trust Fund holds mostly government IOUs (D) According to reliable economists present Social Security is actuarially unsound is not insurance but is a scheme for exacting additional taxes (E) The impractical costly work records system requires the services of an estimated 10 000 government employees at an enormous expense to the taxpayers and (F) It tends by usurping the functions of private insurance companies and destroying the incentive for personal private savings to dry up rapidly the principal sources of private risk capital and

WHEREAS The Social Security is the chief activity of the Department of Health Education and Welfare and far overshadows the importance of the Department's other services of health and education and

WHEREAS According to the investigations by the Harness Subcommittee in 1947 there is evidence of FSA employees breaking the federal law against lobbying by federal employees and

WHEREAS Proposals are now pending in the Congress to extend Social Security to additional citizens before the many faults in the present law have been corrected or wiped out and

WHEREAS Representative Reed Chairman of the House Ways and Means Committee has appointed a Subcommittee on Social Security headed by Representative Carl T. Curtis to make a critical study and thorough investigation of Social Security and

WHEREAS This study offers the potentiality of achieving needed changes in the Social Security Act therefore be it

Resolved That the delegates of the Illinois State Medical Society in regular session assembled make the following recommendation to the President and the Congress of the United States That Social Security be held at status quo and not extended to any other groups at least until after Representative Curtis Subcommittee and any other Congressional Committees have completed their studies and adequate time has been allowed for the consideration and proper evaluation of Committee reports by the people and be it further

Resolved That the delegates make the following recommendations to Representatives Reed and Curtis the members of the Subcommittee on Social Security and to the President and the Congress of the United States

1 That serious consideration be given to having the federal government abandon Social Security by (A) having the individual states finance and administer state pensions if their citizens so desire (B) paying off present beneficiaries with federal funds or (C) transferring the risk to legitimate insurance companies.

2. In lieu of the much preferred abandonment of Social Security (recommendation number one) place Social Security on a pay-as-you-go basic amount pension for everyone at age 65 which would eliminate payroll record keeping would reduce the number of Social Security employees by 10 000 and would encourage beneficiaries to continue working and contribute to productivity rather than being forced to depend on government paternalism as is now the case

3 Return all old age and assistance welfare programs to the states where they can be administered more humanely efficiently and economically

4 Reduce federal taxes in the amount necessary for the states to finance the assistance programs so that the individual states will have untouched sources for taxation

5 Remove compulsion from the pay as you go basic amount pension and place the pension system on an entirely voluntary basis in keeping with the principles of the American free market economy and be it further

Resolved That a copy of this resolution be spread on the minutes of this meeting and that copies of it be sent to (1) the President of the United States (2) all members of Congress and (3) the House of Delegates of the American Medical Association

5 Resolution on Social Security Program

Dr Robert B. Homan Jr., Texas, introduced a resolution, as follows

WHEREAS There is a growing sentiment throughout the nation that the present Social Security program is basically wrong and should be repealed or revised and

WHEREAS The physicians of the United States are well aware of the many faults of the present system and

WHEREAS Proposals are now pending in the Congress to extend Social Security to many groups of self-employed including physicians not now required to pay their own Social Security tax and

WHEREAS Legislation now proposed would give Federal Medical and Hospital care to the beneficiaries of the Old Age and Survivors Insurance and

WHEREAS, The Carl T. Curtis subcommittee of the House Ways and Means Committee is now making a critical investigation of Social Security which offers the potentiality of achieving needed changes in the Social Security Act, therefore be it

Resolved That the House of Delegates of the American Medical Association assembled in regular session in New York City June 1 1953 recommend to the President and the Congress of the United States that there be no extension of Social Security to groups not now covered that there be no federal medical or hospital care established under the Old Age and Survivors Insurance program, and that serious consideration be given to returning to the states the responsibility for financing and administering such pension programs as their citizens desire

Resolutions on Intern Training

The following five resolutions dealing with essentially the same subject were introduced by (1) Dr J. Lafe Ludwig, California, (2) Dr James Q. Graves, Louisiana, (3) Dr Paul Baldwin, Missouri, (4) Dr Carlton E. Wertz, New York, and (5) Dr James Z. Appel, Pennsylvania, and were referred to the Reference Committee on Medical Education and Hospitals

1 Resolution on Intern Training in Private Hospitals

WHEREAS There has developed in the United States a marked shortage of interns available for private hospitals due in part at least to the increasing demands of public military and veterans hospitals and

WHEREAS If the private practice of medicine in the United States to which the American Medical Association is dedicated is to survive our newly graduating doctors must not only receive adequate scientific clinical instruction and experience but must also learn something of the art and economics of private practice with its highly important personal doctor patient relationship with its obvious advantages to society and

WHEREAS These factors essential to the preservation of our heritage and to the welfare of the public can be far more adequately learned by the intern in our many excellent private hospitals which can furnish adequate scientific instruction and experience as well and

WHEREAS The report of the Advisory Committee on Internships of the Council on Medical Education and Hospitals of the American Medical Association which report has been accepted and published in THE JOURNAL as the basis for approval of hospitals for intern training obviously sets up requirements that can be met only by the larger hospitals affiliated with medical schools and is definitely prejudicial to the interests of the hundreds of private hospitals which will find it impossible under these rulings to qualify for intern training now therefore be it

Resolved That a further study be made of this problem with a more realistic attitude toward private medical practice and hospital care in order that continued opportunity may be given to private hospitals to provide the excellent intern training that they have furnished in the past

2 Resolutions on Essentials of an Approved Internship

WHEREAS The report of the Advisory Committee on Internships to the Council on Medical Education and Hospitals of the American Medical Association dated Nov 15 1952 and the Essentials of an Approved Internship prepared by the Council on Medical Education and Hospitals of the American Medical Association dated Nov 15, 1952 and revised Dec 4 1952 stipulates that approved internships can be conducted only in hospitals in which the educational benefits are considered of paramount importance and the service benefits to the hospitals are secondary and

WHEREAS The Council on Medical Education and Hospitals in its concept is trying to make the internship a fifth year of medical education instead of a year or more of medical practice under supervision and

WHEREAS Only hospitals having a capacity of at least 150 beds, exclusive of bassinets and a minimum of 5 000 annual admissions would be accepted for approval and

WHEREAS The establishment and enforcement of these regulations constitutes regimentation of the medical profession and is an encroachment on the individual rights and privileges of practicing physicians therefore be it

Resolved That the Louisiana State Medical Society instruct its delegates to the American Medical Association to express, on the floor of the House of Delegates at the June 1953 meeting of the American Medical Association this Society's objection to these Essentials and recommend that the previous action of the House of Delegates of the American Medical Association with regard to the Essentials of an Approved Internship be revoked and be it further

Resolved That copies of these resolutions be sent to each member of the House of Delegates of the American Medical Association the President and Secretary of the American Medical Association the chairman and members of the Advisory Committee on Internships to the Council on Medical Education and Hospitals of the American Medical Association the chairman and members of the Council on Medical Education and Hospitals and to the president of each state medical society throughout the country

3 Resolution on More Equitable Distribution of Interns

WHEREAS There are each year approximately eight accredited internships in the United States to every five Class A Medical School graduates and

WHEREAS Many large hospitals have increased their number of internships out of proportion to bed capacity increases and clinic needs and

WHEREAS These hospitals regularly get their full quota of interns, and WHEREAS Many other hospitals accredited for internship are unable to secure sufficient interns and often secure none and

WHEREAS The only foreseeable solution to this problem is a more equitable distribution of interns among accredited internships therefore be it

Resolved That the Council on Medical Education and Hospitals of the American Medical Association be instructed to take immediate steps to insure a more equitable distribution of interns

4 Resolution on Revision of Intern Program

WHEREAS There is an admitted shortage of graduate physicians to fill all the approved internships, and

WHEREAS There are many hospitals with excellent training and educational facilities which are not affiliated with medical schools, and

WHEREAS The recent new Essentials of an Approved Internship will make it difficult for many hospitals to obtain interns and

WHEREAS The new two-thirds of a hospital quota requirement will make it even more difficult for many hospitals to obtain interns and

WHEREAS The new 'Essentials' were approved by the American Medical Association House of Delegates at the Denver meeting without having time for a complete study or understanding of all its implications, therefore be it

Resolved That the House of Delegates of the American Medical Association approve the following

1 Postponement for at least three or four years of the time set for the Essentials of an Approved Internship to be put into force and effect

2 Establishment of a new special committee of the American Medical Association to conduct a prompt reevaluation of the intern problem which study would take into consideration the best interests of the patient the hospital and the medical profession such special committee to be composed of physicians half of whom at least shall not be connected with medical schools or their affiliated hospitals and who shall be in the active private practice of medicine

3 Rescinding of the requirement that hospitals meet two-thirds of the number of their normal complement of interns for two years in succession or lose their accreditation

5 Resolutions on Revision of Essentials of Approved Internships

WHEREAS The House of Delegates of the American Medical Association has accepted the report of the Advisory Committee on Internships made to the Council on Medical Education and Hospitals and

WHEREAS This report has been incorporated in the report entitled Revision of the Essentials of an Approved Internship published by the Council on Medical Education and Hospitals in THE JOURNAL of the American Medical Association Feb 14 1953 and

WHEREAS This Revision sets forth drastic changes in the requirements for approval of hospitals for intern training as follows (1) Increases required bed capacity to 150 including bassinets (2) Increases required annual admissions to 5000 excluding newborn (3) Increases required autopsy rate to 25 per cent, and (4) Compels approved hospitals to secure at least ¾ of its annual quota of interns Failure to secure ¾ of the quota for two successive years may result in the loss of the hospital's approved status and

WHEREAS The hospitals in Luzerne and Blair Counties have for many years met in full the requirements of the Pennsylvania State Board of Medical Education and Licensure and

WHEREAS The requirements set forth above will drastically affect all the hospitals in Luzerne and Blair Counties and will automatically prevent several of the hospitals from securing approval therefore be it

Resolved That the Luzerne and Blair County Medical Societies components of the Medical Society of the State of Pennsylvania hereby unanimously express their disapproval of the action of the Council on Medical Education and Hospitals of the American Medical Association and be it further

Resolved That during this period of nationwide shortage of interns the proper solution to this problem would be the arbitrary reduction of the quota allowed every approved hospital in the country in accordance with the number of interns available

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, presented the following report, which, after discussion, was adopted

With regard to the Essentials of an Approved Internship, there were five resolutions submitted by, respectively, Dr J Lafa Ludwig of the California Medical Association, Dr James Q Graves of the Louisiana State Medical Society, Dr Paul Baldwin of the Missouri delegation, Dr Carlton E Wertz of the New York delegation, and Dr James Z. Appel of the Pennsylvania delegation for Luzerne and Blair Counties These resolutions include the following recommendations (1) Revocation of the House of Delegates' action at the Clinical Meeting in Denver in 1952, (2) Disapproval of the action taken at Denver, (3) An arbitrary reduction of the quota allowances of every approved hospital (4) Postponement of enforcement and the effect of the Essentials for three or four years, (5) That a new study of the problem be made by a committee not connected with medical schools or their affiliated hospitals, at least half of whose members shall be engaged in private practice, (6) Rescind the requirements that hospitals need two thirds of the normal complement of interns for two years in succession, and (7) More equitable distribution of interns

Your reference committee recommends a substitute for the aforementioned resolutions as follows

WHEREAS From the hearings before your reference committee at this time it was concluded that the action taken by the House of Delegates at the session in Denver in 1952 was done without opportunity for thorough study and deliberation by the members of the House of Delegates and

WHEREAS There appears to be considerable dissatisfaction with the present Essentials of an Approved Internship as testified to by the number of members who appeared before the committee and

WHEREAS The postponement of enforcement and effectiveness of the Essentials for three or four years would serve no practical purpose therefore be it

Resolved That the House of Delegates abolish the rule whereby approval may be withdrawn from an internship program which for two consecutive years fails to obtain at least two-thirds of its slated complement of interns and be it further

Resolved That further study be continued by a committee appointed by the Speaker of the House of Delegates at least half of whom are doctors in private practice not connected with medical schools or affiliated hospitals

Resolution on Blood Banking

Dr J Lafa Ludwig California, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business

WHEREAS The ready availability of blood and blood derivatives has become a vital necessity to modern medical practice in both the civilian and military populations and therefore a matter of highest concern to the physician and

WHEREAS The independent operation of blood banks of all degrees of excellence throughout the nation by many different agencies some lay and some medical has resulted in some confusion and friction between blood banks and organizations operating blood banks and

WHEREAS The general public is confused irritated and critical of the varying methods of operation among blood banks in the same or contiguous areas and

WHEREAS The professional aspects of the drawing of blood its fractionation and its use as a therapeutic tool must be under medical control and such medical control on a national scale logically should be a function of the American Medical Association and

WHEREAS The American Red Cross has already been designated by the government as the official blood recruitment and distributing agency for the military services and

WHEREAS The present American Red Cross program of so-called free blood without requirement for replacement has made collection of adequate supplies for civilian use difficult has been a tremendous drain on Red Cross funds which might be better devoted to purposes more consistent with Red Cross functions and is inaccurate to the extent that blood is not free but is paid for by the community at large in contributions and by the government through tax revenues now therefore be it

Resolved That this House of Delegates urge the establishment of a coordinated national blood bank program operated by the American Medical Association the American National Red Cross and other qualified organizations interested in blood banking on the following basis

1 Medical aspects of blood banking shall be under the exclusive control of the medical profession

2 Business administration donor recruitment stockpiling for civil defense and disaster relief allocation of supplies to meet military needs and public relations shall be matters of joint concern

3 The supply of blood shall be maintained on a replacement basis

4 The national blood bank program shall be a financially self-supporting but nonprofit arrangement operated in the national interest but with the sole aim of promoting the widest availability of safe usable blood and its derivatives

Report of Reference Committee on Miscellaneous Business

Dr Walter P Anderton, Chairman, submitted the following report, which was adopted

Your Reference Committee on Miscellaneous Business recommends the adoption of the Resolution on Blood Banking, introduced by Dr J Lafa Ludwig of the California Medical Association, with the following slight modifications Change the word 'operated' in the first sentence of the 'Resolved' to 'organized' and insert in the same sentence after the words 'blood banking' the words 'in so far as may be appropriate', change the last word of No 2 of the "Resolved," concern," to 'interest'

Resolution on Osteopathy

Dr J Lafa Ludwig, California, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business

WHEREAS The practice of osteopathy has been recognized legally by all states and unlimited licensure to practice medicine and surgery is granted to graduates of schools of osteopathy in a large majority of states now therefore be it

Resolved That the House of Delegates believes that it would be in the interest of the health and medical welfare of the American people if the American Medical Association were to adopt a policy of assistance by doctors of medicine in the undergraduate and postgraduate education of doctors of osteopathy

Report of Reference Committee on Miscellaneous Business

The Majority Report of the Reference Committee on Miscellaneous Business contains in its first paragraph, on page 739 of THE JOURNAL for June 20, 1953, reference to the committee's action with respect to the foregoing Resolution on Osteopathy

Resolution on Medical Care of Veterans

Dr J Lefe Ludwig, California, introduced the following resolution, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS The highest quality of medical care and rehabilitation of service-connected disabilities in veterans is an undisputed obligation of the Federal Government and a basic requirement of long-term defense and

WHEREAS This program should be the first responsibility of the Veterans Administration's medical program and

WHEREAS In most communities local health facilities are adequate for treatment and rehabilitation of non-service-connected disabilities and

WHEREAS Economy is usually given as the excuse for the Veterans Administration not affording physicians in the home town with the veterans service medical records or records of treatment of the Veterans Administration or otherwise and the lack of such records deters the best medical care and rehabilitation of the veteran as well as working a hardship on the physician and

WHEREAS The present Veterans Administration laws state that non-service-connected illnesses will be cared for by the Veterans Administration if the individual signs an oath that he is unable to pay for private medical care and

WHEREAS Such violations could be eliminated if a more accurate definition of eligible beneficiaries were clearly stated in the law now therefore be it

Resolved That this House of Delegates set up a program which will aid the Congress to

1 Continue the policy of the American Medical Association of advocating the best medical care and rehabilitation of service-connected disabilities

2 Eliminate false economy measures in home town treatment programs and furnish the home town physician with military and Veterans Administration records

3 Eliminate waste in the treatment of non service-connected disabilities by defining a beneficiary sufficiently well so that the expansion of facilities for the care of non-service-connected disabilities is obviated

Resolution on Treatment of Nonservice Disabilities by Veterans Administration

Dr C H Richardson, Georgia, presented the following resolution, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS The House of Delegates of the Medical Association of Georgia has gone on record as being opposed to the general principle of the treatment of nonservice disabilities by the Veterans Administration, therefore be it

Resolved That the House of Delegates of the American Medical Association concur in this resolution

Resolution on Reconsideration of Report of Special Committee on Federal Medical Services

Dr J Wallace Hurff, New Jersey, introduced the following resolution, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS The House of Delegates of the American Medical Association having considered the report of the Special Committee on Federal Medical Services, failed to take positive action as recommended in that said report and

WHEREAS It is imperative that the American Medical Association establish a definitive policy for the care of veterans of our Armed Forces which will include the scope of government responsibility to the veteran and his family therefore be it

Resolved That the House of Delegates of the American Medical Association reconsider the report of the Special Committee on Federal Medical Services—Dr Walter B Martin Chairman—for the purpose of establishing a definite policy

Resolutions on Diminution of Medical Services by the United States Veterans Administration

Dr H H Bauckus, New York, presented the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service

WHEREAS It becomes increasingly apparent that the federal budget should be balanced and

WHEREAS Recent reductions in the budget of the Veterans Administration have resulted in a decrease of the number of hospital beds and out patient facilities available for the care of the veterans, and

WHEREAS These decreased facilities have resulted in lessened care for veterans without regard to whether the disability is service-connected or non-service-connected and

WHEREAS This is to the detriment of veterans with service-connected disabilities who should have every available care in accordance with the intent of the law as well as the wishes and desires of the American people therefore be it

Resolved That the House of Delegates of the American Medical Association urge that the Veterans Administration be required by law to restrict any reduction in the medical care of veterans to veterans who have non service-connected disabilities except in cases of prolonged illnesses such as tuberculosis and psychiatric conditions and in proven hardship cases where local facilities are not available, and be it further

Resolved That copies of this resolution be transmitted to the members of the United States Senate Committee on Labor and Public Welfare to the members of the House of Representatives Committee on Veterans Affairs, to Hon Carl R Gray Jr Administrator of the United States Veterans Administration and to Admiral Joel T Boone Chief Medical Director of the United States Veterans Administration

Resolutions on Medical and Hospital Benefits for Veterans, Government Personnel, and Their Dependents

Dr George A Woodhouse, Ohio, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service

WHEREAS There is now pending before the Congress proposals to modify the present law relating to medical and hospital benefits for veterans and

WHEREAS Congress also has under consideration measures pertaining to the furnishing of medical and hospital care for the dependents of military and other government personnel and

WHEREAS These questions are of major importance to all parties directly concerned and to the nation as a whole therefore be it

Resolved That the American Medical Association should as soon as possible establish definite policies regarding the attitude of the medical profession on these issues in order that members of the Congress may be advised of the views of the medical profession on these questions and be it further

Resolved That the American Medical Association take into consideration the following recommendations in formulating policies on these vital subjects

1 Veterans the same as all other citizens are entitled to adequate medical and hospital care of the highest quality

2 Ex service men and women whose disabilities are the direct result of military service should be provided with such care at the expense of the Federal Government through the facilities of the Veterans Administration

3 Ex-service men and women whose disabilities are of non-service-connected origin and who cannot themselves meet the cost of necessary medical and hospital care should be provided with such care at public expense but such care should be supplied through regular state and local agencies established for such purposes

4 The dependents of military personnel and civilian employees of the armed forces the same as all other citizens are entitled to adequate medical and hospital care of the highest quality

5 Such dependents and civilian employees should be cared for by medical officers of the armed forces only in cases of emergency or in military areas where proper and adequate services cannot be supplied by civilian physicians and adequate hospital services cannot be furnished by civilian hospitals

6 Such dependents and civilian employees who cannot themselves meet the costs of necessary medical and hospital care, or who do not have benefits provided by voluntary medical and hospital insurance programs should be provided with such care at public expense Care furnished to them at public expense should be supplied through regular state and local agencies established for such purposes

7 Physicians should be encouraged to discuss with the members of the armed forces and their families their economic status and should endeavor to work out with them a financial arrangement which would not impose a hardship on such families even to the extent of providing services without reimbursement should that be necessary

Resolution on Medical and Hospital Care of Veterans by the Federal Government

Dr Raymond M McKeown, Oregon, introduced the following resolution, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS The American Medical Association is in complete agreement with the great majority of the American people that veterans who have disabilities resulting from service to our country should be assured by the Federal Government of adequate disability compensation and the highest type of medical and hospital care, and

WHEREAS The American Medical Association recognizes that some veterans have impaired earning capacity because of service-connected disabilities and are unable to provide hospital and medical service for diseases or injuries not related to their military service from their own resources and

WHEREAS Existing federal veterans legislation authorizes the Veterans Administration to provide medical and hospital service to veterans for non-service-connected disabilities if beds are available and the veteran affirms that he is unable to pay for these services, and

WHEREAS This legislation contains no definition of ability to pay in terms of the veteran's income and requires no determination of his economic status and

WHEREAS Under present law and administrative practice medical and hospital services for non-service-connected disabilities are supplied to veterans without regard to their ability to provide these services from their own resources and

WHEREAS Under present and prospective world conditions it appears likely that a very large portion of all able-bodied citizens of military age will be called on for service in the armed forces and

WHEREAS This large body of citizens in discharging this duty of citizenship will become war veterans and under existing law and administrative practice will be eligible to receive medical and hospital services from the Federal Government for diseases and injuries not connected with their military service, and

WHEREAS Unless present law and administrative practice are changed this tremendous increase in the number of veteran beneficiaries will result in a vast expansion of Veterans Administration facilities and personnel and the establishment of a federal socialized medical and hospital system for a large segment of our citizenry which will ultimately destroy our present voluntary system of civilian medical and hospital care and

WHEREAS The American people and the Congress of the United States have clearly indicated their disapproval of the socialization of the nation's medical and hospital service under a federal system of compulsory health insurance and

WHEREAS The great majority of our citizens who are called on for military duty are in the young and able-bodied age group and return to civil life with their earning capacity unimpaired and in many cases increased by vocational training received from the Federal Government during or following their period of service and

WHEREAS Most of these citizens are fully capable of providing care for non-service-connected diseases and injuries from their own resources especially by participation in one of the many voluntary prepayment medical and hospital service and indemnity plans now available to our people therefore be it

Resolved That the House of Delegates authorize and direct the Board of Trustees and the Committee on Legislation to seek to obtain the amendment of existing federal veterans legislation

1 To limit the provision of medical and hospital care to (a) veterans with service-connected disabilities tuberculosis and neuropsychiatric disorders (b) veterans with non-service-connected disabilities who are unable to provide care for such disabilities from their own resources because their earning capacity is impaired by service-connected disabilities and (c) veterans with non-service-connected disabilities who for any other reason are unable to provide care for such disabilities from their own resources

2 To provide a specific definition of ability to pay in terms of the taxable income of the veteran as determined for federal income tax purposes and

3 To require the Veterans Administration to apply this definite standard of ability to pay to all applicants for medical and hospital care for non-service-connected disabilities

Resolution on Treatment of Non-Service Connected Disabilities by Veterans Administration

Dr Robert B Homan Jr, Texas, presented the following resolution, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS A great many of the patients being treated at taxpayers' expense in Veterans Administration hospitals are being treated for non-service-connected disabilities and

WHEREAS Undoubtedly many of these patients are able to pay for their medical care or if indigent can be provided such care at less cost by local communities and

WHEREAS The Special Committee on Federal Medical Services appointed by the Board of Trustees of the American Medical Association, recommended to the American Medical Association House of Delegates in Denver December 2 1952 that it go on record as opposing the care of non-service-connected disabilities in Veterans Administration hospitals and

WHEREAS The Booz, Allen and Hamilton survey recommends that Congress look into this problem of federal care via the Veterans Administration of non-service-connected disabilities and

WHEREAS The Hoover Commission and other independent agencies have called attention to the extravagant building program of the Veterans Administration the careless expenditure of funds in government hospitals and the wasteful use of medical and nursing talent in these institutions and

WHEREAS An elected representative of the American Legion speaking before the American Medical Association House of Delegates in Denver in December 1952 denounced those chiselers who are bringing the medical services of the Veterans Administration into disrepute with the taxpayers both lay and physician and

WHEREAS The House of Delegates of the American Medical Association has resolved with admirable restraint to await the outcome of a proposed conference of the appropriate committees of Congress the Veterans Administration the American Legion the American Hospital Association the American Dental Association, and the American Medical Association before adopting the recommendations of the Special Committee on Federal Medical Services therefore be it

Resolved That the proper councils and committees of the American Medical Association take the necessary steps which will correct existing evils that are permissible by the present existing laws and if necessary support new legislation to correct this evil

Report of Reference Committee on Insurance and Medical Service

The report of the Reference Committee on Insurance and Medical Service regarding the foregoing seven resolutions, which were referred to that committee, will be found on page 733 of THE JOURNAL for June 20, 1953

Resolutions on Public Criticism of Physicians

The following 11 resolutions dealing with the same subject were introduced by (1) Drs J Lefe Ludwig California, (2) Louis M Orr II, Florida, (3) Harlan English Illinois, (4) George A Earl, Minnesota, (5) J Stanley Kenney, New York, (6) James Stevenson, Oklahoma, (7) James Z Appel, Pennsylvania, (8) Robert B Homan Jr, Texas, (9) and (10) Frank J Holroyd, West Virginia, and (11) William D Stovall, Wisconsin, and were referred to the Reference Committee on Legislation and Public Relations

(1) Resolution on Public Relations

WHEREAS The American College of Surgeons through its paid spokesmen and through various of its Regents and other officers has been conducting through the pages of the public press and other media a campaign of destructive criticism of medicine in general by implying that all ghost surgery unnecessary or incompetent surgery is being performed by physicians other than those who are Fellows of the American College of Surgeons or Diplomates of the American Board of Surgery and

WHEREAS The dignity of the profession and the confidence of the public in the medical profession has suffered immeasurably because of the intemperate and unfounded accusations of these individuals now therefore be it

Resolved That this House of Delegates censure the actions of these individuals and be it further

Resolved That the American College of Surgeons and its spokesmen be reminded in the public interest that there already exist adequate methods for correction of such alleged abuses through the constituted channels of the American Medical Association and its component societies

(2) Resolutions on Paul R Hawley, F A C S

WHEREAS Over the past few years it has been the avowed desire of the American Medical Association and its component societies to promote a policy of improved public relations and

WHEREAS This policy has been through the efforts of specific committees and individual members attended with a remarkable degree of success and

WHEREAS This state of favorable public relations has been alluded to as the greatest bulwark against the advent of socialized medicine and

WHEREAS The greatest blow to this policy on public relations and a consummate and open violation of the code of medical ethics has been accomplished through the public utterances of a member of the American Medical Association in regard to splitting of fees unnecessary surgery and ghost surgery namely Dr Paul R Hawley and this undesirable effect has been fostered by the equally public affirmation of another member of the American Medical Association, namely Dr Everts Graham and

WHEREAS This unfortunate publicity has created distrust of and has lowered public confidence in physicians generally therefore be it

Resolved By the Florida Medical Association that such methods of attacking the problem of unethical practices are unsound and are opposed to the best interests of the public and the medical profession and be it further

Resolved That a copy of this resolution be spread upon the minutes of the Florida Medical Association and that a copy be sent to the Chairman of the Board of Regents of the American College of Surgeons and be it further

Resolved That this resolution be carried to the floor of the House of Delegates of the American Medical Association by the delegates of the Florida Medical Association so that it can be given proper consideration and appropriate action

(3) Resolution on Dr Paul R Hawley

WHEREAS Dr Paul R Hawley the Director of the American College of Surgeons who lists his address as 40 East Erie Street Chicago Illinois a service member of the American Medical Association recently was invited by the editors of the U S News and World Report a lay magazine of national circulation and distribution to their conference room where there took place a certain interview appearing in the February 20 1953 issue on pages 48 to 55 both inclusive a true and correct copy of which interview is quoted below and it appears that said interview consisted of many questions propounded to and answered by Dr Hawley on a variety of subjects touching the medical profession and the conduct of its members some excerpts of which are as follows

Q Is it your contention Dr Hawley that fee splitting among doctors is wrong?

A Fee splitting results in a lot of bad surgery and a terrible lot of unnecessary surgery

- Q Does this ghost surgeon work by an x ray? How does he know where to cut?
- A Of course he can have anything he may need for the operation but nine times out of ten no He just takes the word of the doctor who tells him what he thinks is wrong
- Q He is like a butcher?
- A A meat cutter. One of my friends likes to call them hewers of flesh and drawers of blood
- Q Is there any tendency toward abuse in those things? (Referring to fees in sickness funds)
- A On a wide scale no In isolated spots yes I don't know whether you have noticed it out in California or not there have been 200 doctors out there who have been chiseling on the Blue Shield Fund
- Q Isn't all this crusading against unethical practices in medicine going to undermine public confidence in physicians?
- A Yes there is that definite reaction to expect My only answer to that would be that the profession has brought it on them selves

WHEREAS It appears that the answers of Dr Hawley in said interview contain misstatements and distortions of fact, unfounded and uncorroborated charges platitudes innuendoes and generalizations with implications of a pernicious and unsavory nature individual and collective self laudation of grandiose proportions and scurrilous and derogatory remarks tending to bring the medical profession in disrepute and to make it subject to public suspicion ridicule and scorn and

WHEREAS In an unprecedented meeting of the Board of Regents of the American College of Surgeons as reported in newspapers with national and international coverage on or about September 25 1952 the Regents asked the aid of newspapers—not of medical associations and forums—in educating the public to certain evils four of the members being directly quoted on the subject and the same idea with unqualified amplifications and ramifications was echoed by Dr Hawley in his interview above referred to and

WHEREAS It further appears that Dr Hawley in said interview when asked about the selection of a doctor replied If I had any choice

I would not allow anybody to go into my belly who was not a member of the American College of Surgeons or a diplomate of the American Board of Surgeons that he volunteered the statement that 'We in the College of Surgeons investigate all possible unethical practice—unnecessary surgery ghost surgery fee splitting' that when questions If a hospital has your certificate on the wall would it be likely to do this type of surgery (referring to ghost surgery) Dr Hawley replied Oh no But we have given up our own certification! and it appears that all of said answers were self laudations which defy the traditions and lower the moral standards of the medical profession and were deliberately designed to promote and elevate the American College of Surgeons at the expense of all in the medical profession who are not members of said College and that in view of these public pronouncements and others of a similar vein there exists a serious doubt as to whether the American College of Surgeons whose representatives sit on the Board for accrediting hospitals can render an impartial and unbiased report in the performance of their duties and

WHEREAS The American Medical Association is the supreme voice and authority in all matters pertaining to and affecting the medical profession and all other constituent organizations being a part of the whole cannot be greater than the whole the American College of Surgeons through its director and regents, has attempted to arrogate unto itself vast powers which it does not possess and has held itself out as the palladium of medical virtue, it would be catastrophic were other organizations within the American Medical Association seeing this precedent of unbridled and unlicensed newspaper and magazine comments go unchallenged to issue criminalizations and recriminations in airing of medical problems through the medium of lay publications as a consequence of which there would be chaos and confusion of voices and as a resultant the further undermining of public confidence in the medical profession and it is therefore necessary that a thorough inquiry and review be made of this entire situation a policy formulated and established and remedial measures adopted therefore be it

Resolved That the delegates of the Illinois State Medical Society present this report of conditions in its entirety to the House of Delegates of the American Medical Association for inquiry review remedial measures and disciplinary action at the earliest possible date

(4) Resolutions on Public Criticism of Physicians

WHEREAS It is agreed that public criticism of one physician by another is a violation of the Principles of Medical Ethics of the American Medical Association and

WHEREAS In recent months nationwide publicity has been given to intra professional criticism and

WHEREAS Public statements have tended to extol one branch of medical practice and disparage another and

WHEREAS These statements are considered inimical and unbecoming to the dignity of the profession and

WHEREAS These statements tend to undermine and destroy public confidence in all branches of medicine therefore be it

Resolved That the delegates of the Minnesota State Medical Association condemn such statements and direct that its delegates to the American

Medical Association bring this matter before the House of Delegates of the American Medical Association convening in New York in June 1953 and be it further

Resolved That the delegates of the Minnesota State Medical Association to the American Medical Association try to curb such irresponsible actions in the future

(5) Resolutions on Ethical Relationships Between Physicians

WHEREAS Many physicians in general practice realize that ill-advised and misleading news releases or statements can do infinitely more harm to an understanding between doctors of medicine and the American public than can be corrected by years of patient thoughtful and considered effort be it

Resolved That the American Medical Association consider some means of controlling public expressions of its members which are (1) beneath the dignity doctors strive to attain for their profession and/or (2) inclined or intended to cast aspersions upon arouse suspicion against or undermine the public confidence in any particular group within the medical profession and be it further

Resolved That the American Medical Association shall resist attempts by any group or a spokesman for any group to impugn the judgment of the general practitioner or other qualified doctor of medicine in performing any service for which he is qualified and be it further

Resolved That the American Medical Association devise a method by which itemized joint or combined bills covering the professional services of several doctors in respect of a single case may be rendered to a patient or his legally authorized agent by one doctor acting for himself and those doctors who may be associated with him in treating the single case

(6) Resolutions on Statements by Dr Paul R Hawley, Executive Director, American College of Surgeons

WHEREAS Members of the Oklahoma State Medical Association realize that ill advised unfounded false misleading and vitriolic news releases or statements such as were recently made in the lay press by Paul R. Hawley M D Executive Director of the American College of Surgeons, and endorsed by the governing board of the American College of Surgeons have done infinitely more harm to an understanding between doctors of medicine and the American public than can be corrected by years of patient thoughtful and well considered effort and

WHEREAS The Oklahoma State Medical Association steadfastly and sincerely believes in the basic honor both personal and professional of the medical doctors of the United States and

WHEREAS The Oklahoma State Medical Association believes the task of solving this situation can only be accomplished by and through the American Medical Association now therefore be it

Resolved That the American Medical Association be asked to contact immediately the American College of Surgeons or any other medical organization to prevent the recurrence of such statements of official representatives of the American College of Surgeons or any other medical organization that are unethical and tend to destroy the confidence of the public at large in all physicians and be it further

Resolved That the Oklahoma State Medical Association invites the American College of Surgeons to submit to it any documentary evidence it has concerning the unethical practices of any physician who is a member of the Oklahoma State Medical Association and be it further

Resolved That the American Medical Association be asked to continue to resist attempts by any group or spokesman for any group to impugn the judgment of any qualified doctor of medicine in performing any services for which he is qualified and be it further

Resolved That a copy of this resolution be forwarded to the American Medical Association and the American College of Surgeons

(7) Resolutions on Dr Hawley

WHEREAS The Lackawanna County Medical Society a component part of the Medical Society of the State of Pennsylvania and the American Medical Association the parent body of organized American medicine is disturbed by the disservice caused by the interview of the director of the American College of Surgeons in the lay press dealing in unethical medical practice and

WHEREAS This interview with the press has tended to cast a cloak of distrust fear and suspicion upon all practitioners of medicine and American hospitals and

WHEREAS The director of the American College of Surgeons could have officially registered complaints of unethical medical practice to the proper committee or committees of the American Medical Association where controversies of this nature are ordinarily debated instead of through the public press and

WHEREAS His statements discrediting the mutual relationship existing between physician surgeon and hospital patient do not serve in the best interests of the American public the American hospitals, and American medicine therefore be it

Resolved That the Lackawanna County Medical Society gives full endorsement to the statements made by Dr Edward McCormick of the American Medical Association in answer to the director of the American College of Surgeons and be it further

Resolved That a copy of this resolution be forwarded to the House of Delegates of the American Medical Association.

(8) Resolutions on Statements for Publication

WHEREAS Certain spokesmen for an allied medical organization and certain physicians who have written articles have in recent months made statements for publication that would tend to divide the doctors into warring groups and undermine the confidence of the public in the physician of their choice and

WHEREAS The support of newspapers and magazines has been openly sought by these groups in fighting an alleged evil instead of the usual courses open to them through the offices of the parent organization namely the American Medical Association, and

WHEREAS Many of the statements of these spokesmen for some of the allied medical organizations are (A) beneath the dignity that doctors strive to attain for their profession and (B) inclined or intended to cast aspersions on arouse suspicions against or undermine the public confidence in any particular group within the medical profession therefore be it

Resolved That the House of Delegates of the American Medical Association go on record as being opposed to this serious breach of etiquette and of ethics and be it further

Resolved That the Judicial Council be instructed to take the necessary steps to discipline the offenders or prevent the recurrence of unwarranted attack of one group of physicians by another and be it further

Resolved That the Judicial Council take the necessary action to implement a reasonable regulatory procedure which would prevent recurrence of these unfortunate articles in the lay press and to incorporate a press radio and television code at the national level with authority to regulate and pass on medical press radio and television releases by members of the American Medical Association

(9) Resolutions on Dr Hawley, F A C S

WHEREAS Dr Paul R. Hawley the Director of the American College of Surgeons who lists his address as 40 East Erie Street Chicago Illinois a general practitioner and not a member of the American Medical Association recently was invited by the editors of the *U S News and World Report* a lay magazine of national circulation and distribution to their conference room, where there took place a certain interview appearing in the February 20 1953 issue on pages 48 to 55 both inclusive a true and correct copy of which interview is quoted below and it appears that said interview consisted of many questions propounded to and answered by Dr Hawley on a variety of subjects touching the medical profession and the conduct of its members some excerpts of which are as follows

Q It is your contention Dr Hawley that fee splitting among doctors is wrong?

A Fee splitting results in a lot of bad surgery and a terrible lot of unnecessary surgery

Q Does this ghost surgeon work by an x ray? How does he know about where to cut?

A Of course he can have anything he may need for the operation but nine times out of ten no He just takes the word of the doctor who tells him what he thinks is wrong.

Q He is like a butcher

A A meat cutter One of my friends likes to call them hewers of flesh and drawers of blood

Q Is there any tendency toward abuse in those things? (Referring to fees in sickness funds)

A On a wide scale no In isolated spots yes. I don't know whether you have noticed it out in California or not there have been 200 doctors out there who have been chiseling on the Blue Shield Fund

Q Isn't all this crusading against unethical practices in medicine going to undermine public confidence in physicians?

A Yes there is that definite reaction to expect My only answer to that would be that the profession has brought it on themselves and

WHEREAS It appears that the answers of Dr Hawley in said interview contain misstatements and distortions of fact, unfounded and uncorroborated charges platitudes innuendoes and generalizations with implications of a pernicious and unsavory nature individual and collective self laudation of grandiose proportions and scurrilous and derogatory remarks tending to bring the medical profession in disrepute and to make it subject to public suspicion ridicule and scorn and

WHEREAS In an unprecedented meeting of the Board of Regents of the American College of Surgeons as reported in newspapers with national and international coverage on or about September 25 1952 the regents asked the aid of newspapers not of medical associations and forums in educating the public to certain evils four of the members being directly quoted on the subject and the same ideas with unqualified amplifications and ramifications were echoed by Dr Hawley in his interview above referred to and

WHEREAS It further appears that Dr Hawley in said interview when asked about the selection of a doctor replied if I had any choice

I would not allow anybody to go into my belly who was not a member of the American College of Surgeons or a diplomate of the American Board of Surgery, that he volunteered the statement that "We in the College of Surgeons investigate all possible unethical practice unnecessary surgery ghost surgery fee splitting" that when questioned If a hospital has your certificate on the wall would it be likely to do this type of surgery (referring to ghost surgery) Dr Hawley replied Oh no But we have given up our own certification and it appears that all of said answers were self-laudations which defy the traditions and lower the moral standard of the medical profession and

were deliberately designed to promote and elevate the American College of Surgeons at the expense of all in the medical profession who are not members of said College and that in view of these public pronouncements and others of a similar vein there exists a serious doubt as to whether the American College of Surgeons whose representatives sit on the boards for accrediting hospitals can render an impartial and unbiased report in the performance of their duties and

WHEREAS The American Medical Association is the supreme voice and authority in all matters pertaining to and affecting the medical profession and all other constituent organizations being a part of the whole cannot be greater than the whole the American College of Surgeons through its director and regents has attempted to arrogate unto itself vast powers which it does not possess and has held itself out as the palladium of medical virtue It would be catastrophic were other organizations within the American Medical Association seeing this precedent of unbridled and unlicensed newspaper and magazine comments go unchallenged to issue criminalizations and recriminations in airing of medical problems through the medium of lay publications as a consequence of which there would be chaos and confusion of voices and as a resultant the further undermining of public confidence in the medical profession and it is therefore necessary that a thorough inquiry and review be made of this entire situation a policy formulated and established and remedial measures adopted now therefore be it

Resolved That the Congress of Delegates of the American Academy of General Practice recommends that the above conditions in the medical profession be presented to the various state chapters of the American Academy of General Practice The West Virginia Chapter of the American Academy of General Practice urges its members to present to their respective county medical societies the above report with a request for a thorough inquiry review and remedial action at the earliest date, and be it further

Resolved That the Congress of Delegates of the American Academy of General Practice and the Board of Directors of the West Virginia Chapter recommends that the above report be transmitted in its entirety to the official West Virginia delegates of the American Medical Association at the earliest possible date for the institution of disciplinary action

(10) Resolution on Controlling Public Expressions of Members

WHEREAS The American Academy of General Practice realizes that ill advised unfounded false misleading and vitriolic news releases or state ments such as the recent interview published in the magazine *U S News and World Report* by one who takes it upon himself to assume the role of spokesman for an honored and respected medical organization can do infinitely more harm to an understanding between doctors of medicine and the American public than can be corrected by years of patient thoughtful and even considered effort, and

WHEREAS The American Academy of General Practice and the West Virginia Chapter like all other organized groups of doctors respects its position as a subsidiary or constituent of the parent organization of all medical doctors in the United States viz. the American Medical Association and

WHEREAS The American Academy of General Practice and the West Virginia Chapter seek to take any steps necessary to assist in effecting a peaceful unanimity rather than a cacophonous division within the ranks of American doctors and

WHEREAS The West Virginia Chapter of the American Academy of General Practice firmly steadfastly and sincerely believes in the basic honor both personal and professional of the medical doctors of the United States and

WHEREAS The general practitioners of America neither have nor desire to have a quarrel with any group of medical specialists because among the specialty groups are many respected honest and skillful men whom we summon for counsel and help and

WHEREAS The American Academy of General Practice believes that the recent unsavory pseudo-exposé by the Director of the American College of Surgeons forces on the medical doctors of America an urgent necessity for the settlement of certain basic issues to prevent future assaults on the honor integrity and professional standing of general practitioners and the entire medical profession and

WHEREAS The American Academy of General Practice believes this task can only be accomplished by and through the American Medical Association therefore be it

Resolved That 1 The American Medical Association be asked to consider some means of controlling public expressions of its members which are (a) beneath the dignity doctors strive to attain for their profession (b) inclined or intended to cast aspersions on arouse suspicion against or undermine the public confidence in any particular group within the medical profession and (c) possible acts or attempts to gain unfairly preference for any one portion of group of doctors above another because each group of doctors has its service to perform within the economy of medical practice and such acts are too often the product of selfish motives (See Chapter III Article I Sections 1 and 4 Principles of Medical Ethics)

2 The American Medical Association be asked to resist attempts by any group or by a spokesman for any group to impugn the judgment of the general practitioner or other qualified doctor of medicine in performing any service for which he is qualified

3 The American Medical Association be asked to define explicitly a method by which joint or combined bills covering the professional services of several doctors in respect of a single case may be rendered to a patient or his legally authorized agent or the insurance company for

the patient by one doctor acting for himself and those other doctors who may be associated with him in treating the single case

4 The American Medical Association be asked to distribute and disseminate actively and thoroughly to the American people information as to the attitude of the doctors in opposition to exorbitant fees unnecessary surgery ghost surgery split fees commissions and referral fees but at the same time to do all in its power to reassure the public that although a single infraction of medical ethics is serious still such unethical practices are the exception rather than the rule and that the doctors will make every effort to eliminate such unethical conduct as may exist

5 The American Medical Association be enjoined to disclose more adequately through its public relations media the functions of a medical doctor expand the understanding of uninformed people of doctor-patient relationships and ethics and take steps to strengthen any programs for improvement of the understanding by doctors of doctor-patient relationships and be it further

Resolved That 1 A copy of these resolutions be forwarded to the West Virginia delegates of the American Medical Association and that said officers be requested to refer them to the appropriate committees commissions or councils of such Association for study and action, 2 The officers of the American Medical Association be respectfully requested to advise the president of the West Virginia Academy of General Practice in respect to the disposition and action taken after due consideration by the American Medical Association and 3 The president of the West Virginia Academy of General Practice shall report to the West Virginia Academy of General Practice at its next annual meeting what shall have occurred in respect hereto

(11) Resolution on Medical Ethics

WHEREAS It has become the practice of some organizations of various groups within the profession of medicine to state and interpret codes of professional ethics and

WHEREAS Such practice tends to develop statements in different word ing leading to varying interpretations now therefore be it

Resolved That the Principles of Medical Ethics as stated interpreted and applied by the American Medical Association shall be considered as the only fundamental and controlling application of ethics to this profession and any statement by organizations within the general profession of medicine be considered by the members of the American Medical Association as advancing only views of a particular group and as without official sanction of the entire profession as represented by the American Medical Association

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr George S Klump, Chairman, presented the following report, which was adopted

The 11 resolutions dealing with publicity regarding unethical conduct of physicians were considered conjointly The resolutions were introduced by Drs Ludwig of California, Orr of Florida, English of Illinois, Earl of Minnesota, Kenney of New York, Stevenson of Oklahoma, Appel of Pennsylvania, Copeland of Texas, Holroyd of West Virginia (2) and Stovall of Wisconsin

These resolutions were stimulated by recent newspaper and magazine articles reporting statements attributed to an official spokesman of an allied medical organization The members of this organization are also members of the American Medical Association Recognizing the importance of the general problem involved and the proper interest of the public as well as that of the profession, your reference committee devoted a major portion of its open hearing to matters contained in these resolutions All of them were carefully studied Your committee recommends no action on these resolutions but instead that the House give careful objective consideration to the ethical problem involved The principal emphasis of these 11 resolutions may be summarized by the following statement patterned after the resolution introduced by the delegate from Wisconsin

The Principles of Medical Ethics as formulated interpreted and applied by the American Medical Association must be considered the only fundamental and controlling application of ethics for the entire profession Any statement relating to ethical matters by other organizations within the general profession of medicine advance views of only a particular group and is without official sanction of the entire profession as represented by the American Medical Association

Two of the 11 resolutions request, among other things, the development of an approved method for joint billing In addition, the committee received for information the Revised Statement of the Principles of Medical Ethics approved by the Executive Council of the Iowa State Medical Society on Jan 9, 1953 It is the opinion of your committee that matters of this nature should first be studied by the Judicial Council

Your committee calls the attention of the House to the current opinion of the Judicial Council regarding the matters of fee splitting and methods of billing published in THE JOURNAL for Dec 27, 1952

Your reference committee believes that the harm done to the public and to the profession by the current articles which lower the confidence patients have in their doctors cannot be objectively evaluated This highlights the fact that, when individuals or groups without official status in the American Medical Association utter or publish ill-considered statements, the result too often is that the confidence of the public in the medical profession is placed in jeopardy

Your reference committee believes that the members of the House of Delegates have demonstrated their devotion over the years to the principles of American democracy This devotion includes the right of free speech With this, your committee agrees unqualifiedly

Broad generalization, ill advised and poorly prepared statements that often fail to convey the intended meaning are most unfortunate and are to be deplored Destructive critical comments serve no useful purpose Your committee has the utmost confidence that the great majority of our members are entirely capable of avoiding these pitfalls without additional advice from this committee

Your reference committee claims no originality in stating an opinion often expressed by official spokesmen for the American Medical Association that some doctors of medicine violate the Principles of Medical Ethics The committee believes that this involves relatively few physicians and that the geographical distribution is spotty Human nature being what it is this will probably always be true The method evolved for dealing with the problems of unethical conduct and practices by the American Medical Association, while far short of perfection, is still the best and most practical means of correcting these abuses and safeguarding the best interests of the public This method is being and will continue to be followed Dr McCormick in his Inaugural Address called on constituent associations to become increasingly vigilant and aggressive in the pursuit and correction of abuses Many of his predecessors have emphasized this continued need, which is and always will be present, since doctors are subject to the same weaknesses of flesh and spirit as are other persons

The American Medical Association must now and in the future always continue to enunciate to its members and to the public its stand on matters pertaining to abuses and evils in the practice of medicine A positive public relations program must be maintained pointing out the good things the members of the American Medical Association are doing to promote the public health and welfare of the citizens of this country

Resolutions on Federal Legislation

Dr J Lafe Ludwig, California, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS Many issues and policies affecting the American people are being made by national law and international agreements and

WHEREAS The practice of medicine may be affected economically and in a broad scientific sense, and

WHEREAS The American people are always vulnerable to attempts at collectivism through legislative channels and

WHEREAS Our medical societies have contained themselves too long and should now assume the offensive on these matters now therefore be it

Resolved That this House of Delegates be alerted to this particular problem and be it further

Resolved That this House of Delegates heartily endorses and urges every member of the Congress to adopt Senate Joint Resolution Number 1 the Bricker Resolution

Resolution on Bricker Resolution

Dr C H Richardson, Georgia, introduced the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS The House of Delegates of the Medical Association of Georgia has endorsed the position of the American Medical Association in forming an amendment to the Constitution of the United States which will provide that no treaty or executive agreement shall be made which conflicts with any provision of the constitution or which may operate to

regulate any of the purely domestic affairs of the United States and to that end endorses the Bricker Resolution in the national Congress there fore be it

Resolved That the House of Delegates of the American Medical Association further endorse this sentiment

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, presented the following report, which was adopted

Two resolutions were presented asking for the endorsement of the Bricker resolution, one from the Georgia delegation, and one from the California Medical Association After consultation with representatives of the Committee on Legislation and others, your committee submits the following substitute resolution

Resolved That the House of Delegates endorse the principles embodied in Senate Joint Resolution No 1

This is a reaffirmation of a previous action of this House

Resolution on Freedom Under God

Dr J Lafe Ludwig California, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business

WHEREAS Our Founding Fathers were deeply and reverently aware that freedom for the individual can be secured and preserved only if the individual recognizes and assumes responsibility for the intelligent exercise of that freedom and

WHEREAS The Declaration of Independence acknowledges the Great Creator as the source of all freedom and

WHEREAS There is grave and serious danger that in our modern society with its remarkable material achievements and accompanying creature comforts freedom may disappear through thoughtless and careless disregard for its origin now therefore be it

Resolved That the House of Delegates of the American Medical Association heartily endorses the third annual Freedom Under God Observance of Independence Week during the period of June 28 to July 5, as sponsored by Spiritual Mobilization

Report of Reference Committee on Miscellaneous Business

Dr Walter P Anderton, Chairman, submitted the following report, which was adopted

Your Reference Committee on Miscellaneous Business has considered the resolution introduced by Dr J Lafe Ludwig for the California Medical Association entitled Freedom Under God Your committee, having heard this resolution discussed, believes that the American Medical Association has many members interested in and identified with various creeds, with differences of opinions and beliefs It believes that the adoption of the aforesaid resolution would establish an unwise precedent, and therefore recommends no action on it

Resolution on Today's Health

Dr Louis M Orr II, Florida, introduced the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary

WHEREAS We are highly conscious of the potency of the physician's office as an integral part of sound medical public relations and

WHEREAS We are of the belief that the American Medical Association's publication *Today's Health* is designed to serve the interests of the lay public from the standpoint of good health information and

WHEREAS We feel more physicians offices should have a copy of *Today's Health* available to the physicians patients now therefore be it

Resolved That the Florida Medical Association petition the House of Delegates of the American Medical Association to authorize the setting aside of \$1.50 of the annual dues of each of the dues-paying members of the American Medical Association for the purpose of purchasing a subscription to *Today's Health* to be addressed to the office of each of the physicians

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr H Russell Brown, Chairman, presented the following report, which was adopted

Resolution on Today's Health The adoption of this resolution would necessarily cause a large increase in the expenditure of funds by the Association In addition, other plans

have been proposed for a wider distribution of *Today's Health* Therefore, your committee recommends that this resolution be not adopted

Resolution on General Practitioner Award

Dr Louis M Orr II, Florida, presented the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary

WHEREAS The medical profession and the nation's medical schools are currently making a definite effort to encourage a revived interest in general practice and

WHEREAS There is positive evidence that during the past four or five years an increasing percentage of medical students plan to enter general practice and

WHEREAS Throughout the nation many young physicians already are making excellent records as general practitioners therefore be it

Resolved That the American Medical Association in its annual selection of the General Practitioner of the Year make a definite effort to give consideration to the younger physicians who are doing fine work as family doctors

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr H Russell Brown, Chairman, submitted the following report, which was adopted

Resolution on General Practitioner Award After careful consideration of this resolution, your committee believes that no action on it is needed, because adequate consideration is already being given to its objective by the Board of Trustees

Resolution on Department of Health, Education, and Welfare

Dr C H Richardson, Georgia, introduced the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

Resolved That the House of Delegates of the Medical Association of Georgia endorse the action of the House of Delegates of the American Medical Association in approving the action of the federal government in combining the Federal Security Agency into a Department of Health Education and Welfare with cabinet status

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, presented the following report, which was adopted

Dr Richardson of Georgia introduced a resolution endorsing the action of the House of Delegates of the American Medical Association and approving the action of the Federal government in creating a Department of Health, Education and Welfare, with cabinet status The reference committee commends the Medical Association of Georgia on this action

Resolution on Insurance Rates in Partnerships

Dr Wendell C Stover, Indiana introduced the following resolution on Insurance Rates in Partnerships, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS Information has been obtained by the headquarters office of the Indiana State Medical Association that certain medical malpractice insurance is being written on medical partnerships in which an extra charge is made to cover not only each of the members but also the partnership on the basis that it is a separate entity the same as the individual members of the partnership and that this results in requiring a partnership consisting of two members to pay a premium of three times the rate for which an individual physician could obtain insurance instead of two times the rate although the amount of risk involved could be no greater than the combined risk on two individual physicians and

WHEREAS This method of charging premium rates results in discrimination against physician partnership and

WHEREAS The American Medical Association is making a study of medical malpractice insurance problems therefore be it

Resolved That the Indiana State Medical Association recommends and suggests that this method of ascertaining premium rates for insurance on medical partnerships be brought to the attention of the American Medical Association House of Delegates and that the delegates from Indiana to the House of Delegates be and hereby are directed to present this resolution to the next meeting of the House of Delegates of the American Medical Association and urge that the Association instruct its committee studying malpractice insurance to take appropriate action to eliminate this element of discrimination in medical malpractice insurance policies.

Report of Reference Committee on Insurance and Medical Service

Dr Gerald V Caughlan, Chairman, submitted the following report, which was adopted

Resolution on Insurance Rates in Partnerships This resolution, introduced for the Indiana State Medical Association, has to do with insurance rates in partnerships and describes a situation which deals with premium rates for malpractice insurance on medical partnerships Inasmuch as the Council on Medical Service is at present conducting a survey regarding malpractice insurance, your committee recommends that this matter be referred to the Council on Medical Service calling attention to this situation

Resolution on Advertising of Medical Products

Dr Wendell C Stover, Indiana, introduced the following resolutions, which were referred to the Reference Committee on Miscellaneous Business

WHEREAS The advertising of therapeutic agents in the official journals of the American Medical Association carries the implication of approval of the material by the Association and

WHEREAS Every method of promotion of any products bearing the seal of a council of the American Medical Association is under the control of the council and

WHEREAS It is not difficult for advertising material to be so devised as to convey a somewhat different total impact from what is actually justified now therefore be it

Resolved That the Indiana State Medical Association declares that the appropriate agencies of the American Medical Association should exercise diligent care that advertising in the official journals and that promotion of approved products should conform both in spirit and in detail with the actual safety and the truly established indications of the products and be it further

Resolved That delegates from the Indiana State Medical Association be instructed to present this resolution to the House of Delegates of the American Medical Association in New York this year

Resolution on Magazine Trustee

Dr Wendell C Stover, Indiana, presented the following resolutions, which were referred to the Reference Committee on Medical Education and Hospitals

WHEREAS The American Hospital Association publishes a magazine entitled *Trustee* and

WHEREAS The editorial policies of the magazine *Trustee* are determined only by representatives of the American Hospital Association and

WHEREAS This magazine *Trustee* is distributed to administrators and board members of hospitals throughout the country and

WHEREAS This magazine presents only the views and opinions of the American Hospital Association and the hospital administrators regarding problems of hospitals and the medical staffs of hospitals, therefore be it

Resolved That the House of Delegates of the American Medical Association go on record as recommending the establishment of a liaison committee with the administrators and boards of trustees of hospitals setting forth the views of physicians regarding physician-hospital relationships and other information of mutual interest to physicians and hospitals and be it further

Resolved That a copy of this resolution be forwarded to the American Medical Association with the request that the resolution be presented to the House of Delegates of the American Medical Association for its consideration and approval

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, submitted the following report, which was adopted

The resolution submitted by Dr Wendell C Stover of the Indiana delegation concerning the magazine *Trustee* as it deals with the physician hospital relationship recommends that a liaison committee be established between the American Medical Association, administrators, and board of trustees of hospitals It is the opinion of your reference committee that there is much being done on the national level along these lines and that further efforts could best be considered at state and local levels

Resolution on American Medical Education Foundation

Dr Harlan English, Illinois, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals

WHEREAS The Illinois State Medical Society recognizing the need for continuing support of the American Medical Education Foundation has by action of its House of Delegates in 1952 and again in 1953 collected \$20 per member per year earmarked for that fund, now therefore be it

Resolved That the House of Delegates of the American Medical Association recommend that the Illinois plan be submitted to each constituent association of the American Medical Association as a reasonable equitable and very satisfactory solution to the problem of physician responsibility to the American Medical Education Foundation

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, presented the following report, which was adopted

Regarding the resolution introduced by Dr Harlan English for the Illinois State Medical Society concerning the American Medical Education Foundation in which they are recommending to the various states the suggestion to follow the Illinois plan in the collection of funds for the American Medical Education Foundation, the Illinois plan is a reasonable, equitable, and satisfactory solution to the problem of physician responsibility to the Foundation in aiding medical schools through the assessment of dues of \$20 per member per year which is earmarked for this specific purpose Your reference committee unanimously approved this resolution and recommends its adoption

Resolutions on Principles of Medical Ethics

Dr Harlan English, Illinois, introduced the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and Bylaws

WHEREAS The Principles of Medical Ethics of the American Medical Association and the interpretations thereof have as a result of recent rather widely publicized diversified expressions of opinion been the subject of much discussion among the various individuals and many groups within organized medicine and

WHEREAS The resultant differences of opinion have caused considerable unrest and some misgivings within the medical profession due primarily to the implications of improper conduct on the part of the profession as a whole because of the improper acts of a small minority of members of the profession and

WHEREAS A number of members of the profession claim as proper the issuance of an itemized joint bill when more than one physician participates actively in the care of a patient because of local acceptance of the procedure by both the public and members of the profession and

WHEREAS The Principles of Medical Ethics of the American Medical Association while very explicit in consideration of duties of physicians in consultations and in many other matters of physicians relations with one another do not give sufficient consideration to the duties of physicians in the joint care of a patient therefore be it

Resolved That the House of Delegates request the Judicial Council of the American Medical Association to give further consideration to the interpretations of the Principles of Medical Ethics with special references to proper billing procedures and be it further

Resolved That the Council on Constitution and Bylaws of the American Medical Association at present engaged in a revision of the Principles of Medical Ethics, be requested to give consideration to the drawing up of an amendment dealing with the duties of physicians in instances of active cooperative care of a patient by two or more physicians defining proper conduct and responsibilities of the physicians involved in such care and stating procedures to be followed in properly billing the patient for services rendered to enable the physicians participating in such a case to obtain adequate compensation.

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, presented the following report, which was adopted

Resolutions on Principles of Medical Ethics Your committee has given these resolutions very serious consideration and approves the resolutions changed as follows

Resolved That the Council on Constitution and Bylaws of the American Medical Association at present engaged in a revision of the Principles of Medical Ethics be requested to give consideration to the matter of the drawing up of an amendment dealing with the duties of physicians in instances of active cooperative care of a patient by two or more physicians defining proper conduct and responsibilities of the physicians involved in such care and stating procedure to be followed in properly billing the patient for services rendered and be it further

Resolved That the Council on Constitution and Bylaws be requested to seek the advice of the Judicial Council in its consideration of this problem

Resolutions on Proposed 23d Amendment to Constitution of United States (H J Res 123)

Dr Harlan English, Illinois, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS Congressman Ralph W Gwinn on January 13, 1953 introduced H J Res 123 which would initiate an amendment to the Constitution relative to prohibiting the United States government from engaging in any business professional commercial financial or industrial enterprise except as specified in the Constitution (referred to as the Proposed 23rd Amendment) therefore be it

Resolved That the Delegates of the Illinois State Medical Society in regular session assembled do hereby express their full support of H J Res 123 and urge the Congress of the United States to pass H J Res 123 and be it further

Resolved That a copy of this resolution be spread on the minutes of this meeting and that copies be sent to the President of the United States and to all members of Congress and of the House of Delegates of the American Medical Association

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, presented the following report, which was adopted

A resolution introduced by Dr English of Illinois asking for support of H J Res 123 has been seriously considered. The principles enunciated in this resolution are essentially the same as those endorsed by this House four years ago. Your committee recommends that this bill be studied by the Committee on Legislation together with other similar proposed legislation, and that no further action be taken on this resolution at this time.

Resolutions on International Labor Organization

Dr Harlan English, Illinois, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS The International Labor Organization meeting in Geneva in June 1952 approved a Convention (treaty) on minimum standards of social security in nine fields—medical care sickness benefits unemployment benefits old age benefits unemployment injury benefits family benefits maternity benefits invalidity benefits, and survivor benefits and

WHEREAS Ratification of this Convention by the United States Senate would place this country under obligation to put at least four of the nine programs in operation and

WHEREAS Ratification of the Convention by the United States Senate would be a step toward plunging this nation further into nation-destroying socialism and

WHEREAS The United States Congress in 1935 voted this country a member state of the International Labor Organization without public hearings or debate therefore be it

Resolved That the members of the Illinois State Medical Society recommend and urge the Senate of the United States not to ratify this Convention and to withdraw this country from membership in the International Labor Organization and be it further

Resolved That a copy of this resolution be spread on the minutes of this meeting and that copies of it be sent to all members of the Senate and of the House of Delegates of the American Medical Association.

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, submitted the following report, which was adopted

A resolution introduced by the Illinois State Medical Society dealing with the ratification of the Geneva June, 1952, Convention of the ILO has been studied. Your committee approves this resolution which reaffirms an action previously taken by the House.

Resolution on Creation of Department of Health

Dr Charles G Hayden, Massachusetts, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS The continuing threat of enemy attack on the civilian population of the United States especially in industrial areas makes it imperative that there be formulated an over all medical plan providing for the best possible utilization of all medical personnel and facilities in the event of all-out war and

WHEREAS The development and implementation of such a plan requires that virtually all federal medical activities be coordinated in a single federal agency and

WHEREAS The House of Delegates on March 14 1953 reaffirmed its stand in favor of an independent Department of Health and

WHEREAS The House of Delegates in December 1950 recommended exclusion of the medical services of the Armed Forces and Veterans Administration from any independent agency with executive status and

WHEREAS Exclusion of the medical services of the Veterans Administration and certain medical activities of the Armed Forces from a Department of Health would result in a Department consisting essentially of the Public Health Service and

WHEREAS It is unrealistic to argue for the establishment of a Department of Health consisting essentially of the Public Health Service therefore be it

Resolved That the Speaker of the House of Delegates be and is hereby directed to appoint a representative committee to study and report as soon as possible on the feasibility of establishing a Department of Health to include the following functions facilities and personnel as recommended by the Commission on the Organization of the Executive Branch of the Government (Hoover commission)

(A) The general hospitals of the Armed Forces in the continental United States (except a medical center for each of the three services) and station hospitals (certain of which the Navy calls dispensaries) in the continental United States except those at outlying posts so located that other hospitals of the Department of Health would not be near enough to provide the care required

(B) The hospital functions of the Veterans Administration in toto including the outpatient services in the field offices of the Veterans Administration

(C) The four nonmilitary hospitals in the Canal Zone

(D) The hospitals of the Public Health Service

(E) The functions facilities and personnel of the Public Health Service

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, submitted the following report, which was adopted

Your reference committee studied the resolution presented by Dr Hayden of Massachusetts on the subject of creation of a Department of Health. Your reference committee reaffirms the stand of the House that it is the continuing policy of the American Medical Association to strive for the creation of a federal Department of Health. Now working on this problem is a subcommittee of the Council on Medical Service known as the Committee on Federal Medical Services which is charged with the responsibility of studying all activities in this field. It is the opinion of your reference committee that no useful purpose could be gained by the creation of a separate committee as recommended in the resolution, as this would duplicate the function and activities of the current committee. The reference committee is of the opinion that the subcommittee of the Council should be asked to study the various points outlined in this resolution.

Resolution on Payment of Back Dues

Dr George A Earl, Minnesota, introduced the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws

WHEREAS The Minnesota State Medical Association has under consideration the payment of dues in the American Medical Association as one of the requirements for membership in the Minnesota State Medical Association and

WHEREAS The present regulations of the American Medical Association require the payment of back dues in the American Medical Association and

WHEREAS Such regulations jeopardize the enactment of such proposed change in the Bylaws of the Minnesota State Medical Association now therefore be it

Resolved That the American Medical Association be respectfully requested to alter its regulations so that in the event of such requirement being adopted by a constituent state society the payment of dues for such current year be sufficient for membership in good standing in the American Medical Association without the payment of any back dues

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, submitted the following report, which was adopted

Resolution on Payment of Back Dues Your committee approves this resolution in principle. It believes that when a state association makes it mandatory to belong to the American Medical Association in order to be a member of the state medical society, then this provision of the resolution is sound policy. We do, however, believe that the various state

medical associations should have time to study this resolution. We have been advised that some legal problems may arise at the state level. Your committee therefore recommends that copies of this resolution, with a copy of the remarks of the committee, be sent to the individual state medical societies, and that this resolution be considered at the December, 1953, interim session of the House of Delegates.

Resolution on Selection of Interns

Dr Paul Baldwin, Missouri, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS The method of the cooperative selection of interns also known as the matching system has been in operation for two years under the joint sponsorship of the major national hospital associations and of the American Medical Association Council on Medical Education and Hospitals and

WHEREAS From the point of view of students the new system has provided no benefit that was not provided as well or better under individual negotiation but has on the contrary fostered undesirable arrangements in violation of the letter and spirit of the system and its objectives and

WHEREAS The new method has proved ineffective in aiding hospitals to avoid confusion but has prevented them from making firm and timely commitments with promising students and

WHEREAS The administration of the new system involves the annual expenditure of from \$35 000 to \$40 000 paid jointly by hospitals and students and

WHEREAS Insofar as the system is effective at all it operates to the unfair advantage of medical school teaching centers and to the relative disadvantage of hospitals without university affiliations particularly in rural areas now therefore be it

Resolved By the House of Delegates of the American Medical Association that the cooperative or 'matching' system of intern selection be abolished

Resolution on Restudy of Matching Plan for Internships

Dr Carlton E Wertz, New York, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS The Matching Plan instituted by the American Medical Association approximately three years ago for the apportionment of interns has resulted in the channelling of applicants for internships into teaching hospitals and medical centers with full-time clinical directors and

WHEREAS The choice of applicants for internships frequently coercive has caused the matching plan to work to the detriment of smaller hospitals by depriving them of an adequate allocation of interns and

WHEREAS The smaller hospitals must still carry the bulk of patient load and to do so effectively must have adequate house staffs, now therefore be it

Resolved That the House of Delegates of the American Medical Association hereby condemns the interference of teaching institutions with the operation of the matching plan and asks for restudy of the problem so that a more equitable allocation of interns may be achieved

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, presented the following report, which was adopted:

Because of the high interest in the intern situation the deliberations of your reference committee involved much discussion of the problem of internships. To clarify in the minds of the delegates the position of the National Intern Matching Program, Incorporated, your reference committee would like to call to your attention the fact that this organization is a separate and distinct corporation having been in existence for three years. The member organizations of this corporation and their vote of power are represented as follows: American Hospital Association, 2 votes; American Protestant Hospital Association, 1 vote; Association of American Medical Colleges, 3 votes; Catholic Hospital Association, 1 vote; and Council on Medical Education and Hospitals of the American Medical Association, 3 votes. The function of this corporation is to act as a clearing house for applications for internships. The corporation has an agreement both with the student and with the hospital. It does not attempt in any way whatever to influence the placing of interns, it has nothing to do with the stipend offered by hospitals nor with the educational program of hospitals, and it does not direct students to hospitals.

The Resolution on Selection of Interns, introduced by Dr Paul Baldwin of the Missouri State Medical Association, recommends that the cooperative or 'matching' system of intern selection be abolished. Your reference committee feels that the matching plan should not be discontinued and therefore disapproves of this resolution.

Your reference committee agrees with the resolution introduced by Dr Wertz for the Medical Society of the State of New York, which recommends that the House of Delegates condemn the interference of teaching institutions with the operation of the matching plan and asks for restudy of the problem so that a more equitable allocation of interns may be achieved. Your reference committee recommends that the American Medical Association representatives to the corporation known as the National Intern Matching Program, Inc., be instructed to request that corporation to restudy the problem and implement its improvement.

Resolutions on Physician Placement Conference

Dr John P Culpepper Jr, Mississippi, presented the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

WHEREAS The Council on Medical Service conducted a conference on physician placement in Memphis, Tenn., in March 1953 for several southern and southwestern states and

WHEREAS This conference proved invaluable to the several participating constituent associations in the matter of disseminating information and fixing policy for physician placement, now therefore be it

Resolved That the Council on Medical Service be commended together with its most capable headquarters staff and be it further

Resolved That this type conference be conducted annually on a regional scale to the end that (1) a maximum number of state society officers may attend by travelling a minimum distance and (2) placement problems common to a restricted geographical region may be treated by the states involved

Report of Reference Committee on Insurance and Medical Service

Dr Gerald V Caughlan, Chairman, submitted the following report, which was adopted:

A resolution introduced by Dr John P Culpepper Jr, Mississippi State Medical Association, having to do with the subject of physician placement conferences was referred to this reference committee. The statement is made that a conference on physician placement in Memphis, Tenn., in March, 1953, was very successful and the recommendation is made that this type of conference be conducted annually on a regional scale to the end that a maximum number of state society officers may attend by traveling a minimum distance and placement problems common to a restricted geographical region may be treated by the states involved. Your committee studied this resolution and feels that these regional conferences are of value, and recommends that they be continued. Your committee commends the Council on Medical Service for the conduct of these conferences.

Resolution on Seating on American Medical Association Delegates

Dr John P Culpepper Jr introduced the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws:

WHEREAS Division Three, Chapter IX, Section 1 (B) of the Bylaws of the American Medical Association provides that delegates and alternates from constituent associations sections the various branches of the armed forces having organic medical facilities the United States Public Health Service and the Veterans Administration shall be selected for two-year terms and shall assume office on January 1 of the year succeeding their election or appointment and

WHEREAS No provision is made in these Bylaws for the interim seating of a delegate who may be additionally elected or appointed by reason of increased membership in a constituent association and

WHEREAS No orderly procedure is prescribed for unseating or retiring a delegate or delegates from a constituent association because of loss of membership and

WHEREAS There is no provision for the orderly retirement or unseating of a delegate who may be defeated for reelection and yet be eligible to represent his constituent association in two regular meetings following his defeat now therefore be it

Resolved That the following paragraph be added to the Division Chapter Section and subsection of the Bylaws referred to above

"When a constituent association enjoys sufficient gain in membership as to warrant an additional delegate, the Secretary of the American Medical Association shall so notify the constituent association. The additional delegate shall be elected or appointed as the case may be to serve a term of one year which shall be construed to mean the next annual meeting and the succeeding clinical or interim meeting. Following this term of office his seat shall be subject to reappointment or reelection provided the membership of the association warrants the allocation of his seat. When, on the other hand the membership of a constituent association decreases during a calendar year to such an extent that a delegate or delegates are no longer authorized that constituent association then the Secretary of the American Medical Association shall so inform the constituent association and the delegate or delegates in question shall be unseated and retired according to the most recently regulated elected or appointed seats from that association. Delegates elected or appointed from constituent associations shall assume office at the first annual meeting of the House of Delegates of the American Medical Association or on January 1 each event following their election, whichever comes first except that in no event may a delegate be certified to the Secretary of the American Medical Association later than May 31 prior to the annual meeting

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, presented the following report, which was adopted

Resolution on Seating of American Medical Association Delegates Your committee, after due consideration of this resolution, feels that because of the different conditions in the several states and because the committee is of the opinion that each state should decide the manner of election of its delegates, this resolution should be referred to the Council on Constitution and Bylaws without recommendation

Resolution on Derogatory Article

Dr John P Culpepper, Mississippi, introduced the following resolution which was referred to the Reference Committee on Miscellaneous Business

WHEREAS An article entitled 'The Doctor Cartel an Urgent Problem' was published in Home Life a nationally circulated magazine edition of May 1953 published by the Southern Baptist Convention and

WHEREAS The article written by one Jesse C. Burt Jr unfairly and wrongly portrays the medical profession and openly asserts that the American Medical Association has created a shortage of physicians by causing limitation on the enrolments of medical schools and

WHEREAS These assertions are contrary to fact and the constructive course pursued by the American Medical Association in undertaking to provide the best possible medical service for all now therefore be it

Resolved That the article and the misinformation it conveys be deplored and refuted and that the American Medical Association answer its libelous accusations with a true recounting of its program of medical service

Report of Reference Committee on Miscellaneous Business

Dr Walter P Anderton, Chairman, presented the following report, which was adopted

With regard to the resolution by Dr Culpepper of Mississippi calling attention to a derogatory article published in "Home Life," your committee is in complete agreement with Dr Culpepper and recommends passage of the resolution and its referral to the Board of Trustees for implementation

Resolutions on Compact of Western States for Medical Education (S 1515)

Dr Raymond F Peterson, Montana, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS The future of this Nation and of the western states in particular is dependent on the quality of the education of its youth, and

WHEREAS Many of the western states individually do not have sufficient numbers of potential students to warrant the establishment and maintenance within their borders of institutions for all of the essential fields of professional and graduate training in medicine dentistry veterinary medicine and public health nor do all of the states have the financial ability to furnish within their borders institutions capable of providing acceptable standards of training in all of the fields mentioned above, and

WHEREAS It is believed that the western states or groups of such states within the region cooperatively can provide acceptable and efficient tax supported educational facilities to meet the needs of the region and of the students thereof and

WHEREAS The legislative bodies of at least seven of the western states have ratified the Compact for Western Regional Cooperation in Higher

Education and thereby have created and become members of the Western Interstate Commission for Higher Education, and

WHEREAS Section 10 of Article I of the Constitution of the United States provides that No State shall without the consent of Congress enter into any agreement or compact with another State and

WHEREAS The duly elected Senators from the western states have introduced a bill known as S 1515 in the United States Senate to give the required consent to the western states to create and operate the Western Interstate Commission for Higher Education and

WHEREAS Passage of this legislation will resolve and remove any legal restrictions which may confront the individual states or universities which ratify the Compact and thereby become members of the Commission now therefore be it

Resolved That the House of Delegates of the American Medical Association hereby endorse and urge immediate passage of S 1515 and that it instruct its Committee on Legislation and members of the staff of its Washington Office to encourage and promote passage of this legislation and be it further

Resolved That copies of this resolution be forwarded to the President of the United States the Secretary of the Department of Health Education and Welfare of the United States and the members of the United States Senate and House of Representatives

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, presented the following report, which was adopted

The Montana resolution introduced by Dr Peterson requests endorsement of S 1515 Your reference committee looks with favor on the intent of the proposals relating to medical education contained in this bill but questions other features of the bill which may permit other unspecified activities Your committee recommends that the matter be studied by the Committee on Legislation with the advice of the Council on Medical Education and Hospitals

Resolutions on Portrayal of Physicians in Television and Radio Advertising

Dr Karl S J Hohlen, Nebraska, introduced the following resolutions, which were referred to the Reference Committee on Miscellaneous Business

WHEREAS Television and radio are using more and more frequently in their advertisements individuals who although not physicians portray the part and while garbed in white embellished with stethoscope or head mirror recommend to millions of listeners nostrums of all types and descriptions which supposedly cure many systemic diseases highly vitaminized products from bread and milk to toothpaste as well as cigarettes for their fancied effect on coughs and colds and

WHEREAS Physicians themselves have been used to corroborate the merits of certain products as well as the authenticity of claims made by certain manufacturers and have been depicted examining performers such as magicians to substantiate a claim as to their physical status before and after a mystic act on television all of which is contrary to the Principles of Medical Ethics of the American Medical Association and

WHEREAS These individuals in the light of their characterization imply that these products are accepted by the medical profession as being specifically ameliorative or curative and

WHEREAS Too large a percentage of our citizens who are credulous to such an approach are led astray as to the merits of these claims and thereby purchase and continue to use such nostrums at a time when they should be under the care of reputable physicians who would institute proper treatment and thereby enhance the possibilities of a return to health rather than lingering illness or death therefore be it

Resolved That the House of Delegates of the Nebraska State Medical Association meeting in annual session May 11 1953 petition the American Medical Association through its House of Delegates to request the Federal Communications Commission, the National Association of Radio and Television Broadcasters and the Federal Trade Commission to prohibit individuals from characterizing physicians and recommending products of any type or character as aids or remedies in the treatment of any ailment usual or unusual to the human and be it further

Resolved That the Judicial Council of the American Medical Association be requested to investigate this matter and censure those of the profession who by the aforementioned conduct violate the Principles of Medical Ethics and be it further

Resolved That copies of these resolutions be forwarded to the Council on Pharmacy and Chemistry and the Bureau of Legal Medicine and Legislation of the American Medical Association the Federal Communications Commission the National Association of Radio and Television Broadcasters and the Federal Trade Commission and be it further

Resolved That copies of these resolutions be transmitted to the state medical associations and through them to their component county medical societies urging them to forward similar resolutions to the American Medical Association the Federal Communications Commission the National Association of Radio and Television Broadcasters and the Federal Trade Commission

Report of Reference Committee on Miscellaneous Business

Dr Walter P Anderton, Chairman, presented the following report, which was adopted

Your committee has carefully considered the Nebraska resolutions concerning the portrayal of physicians in television and radio advertising, and agrees with the intent of the resolutions. It is, however, the opinion of your committee that the American Medical Association can accomplish more by offering cooperation than by adopting resolutions of condemnation. Your committee recommends that this matter be referred to the Board of Trustees, and further recommends that the Board confer with the Public Relations Department of the American Medical Association and then arrange a meeting of mutually interested parties in the radio and television industry. Your committee also recommends that county and state medical societies consult with and offer cooperation to their local radio and television stations in the solution of problems concerning the medical profession. It is believed that much can be accomplished in the national advertising field by bringing pressure on local stations through expressions of approval or disapproval by individual physicians.

Resolution on Doctor Draft Law

Dr A H Aaron, New York, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS State and local advisory boards at considerable effort have determined a Special Registrant's status as being either essential or non-essential and have had this recommendation reversed by local boards under Selective Service therefore be it

Resolved That the Selective Service System be solicited to change the regulations so that wherein a state advisory committee's opinion and a local board's opinion differ that the status determined by the state advisory committee shall be the one of acceptance

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, submitted the following report, which was adopted

In studying the resolution introduced by Dr Aaron of New York relating to the Doctor Draft Law, your reference committee had the benefit of the advice of several individuals who are working with state and local advisory committees to Selective Service and the Secretary of the Council on National Emergency Medical Service. Your committee understands that the objectives of this resolution were carefully considered by that Council and by the National Medical Advisory Committee and that an enabling amendment to the current draft legislation was not submitted, however, your committee is of the opinion that this matter is of sufficient importance to request the Council on National Emergency Medical Service to study further this aspect of the Doctor Draft Law.

Resolution on Reevaluation of Residency and Postgraduate Training

Dr R J Azzari, New York, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals

WHEREAS Postgraduate medical education and residency training programs over recent years have been greatly influenced by the various specialty boards and have largely done away with the old preceptor systems which did have certain advantages, and

WHEREAS These specialty boards have been set up with the approval or cooperation of the Council on Medical Education and Hospitals of the American Medical Association and

WHEREAS The members of the governing bodies of the various boards and of the Council are largely university physicians and not men in the active practice of their profession and

WHEREAS This has tended to insure a steady output of residents trained for teaching or research but not for practice and

WHEREAS The nonuniversity hospitals and their specialists throughout the country who now have difficulty getting assistants or residents could provide a wide range of teaching material that is being largely overlooked at present therefore be it

Resolved That the House of Delegates of the American Medical Association appoint a committee representing both university teachers and practicing physicians to investigate and re-evaluate the basic funda-

mentals of the present postgraduate and residency training program and insure some representation of active practicing physicians on the various specialty boards and the Councils of the American Medical Association

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, presented the following report, which was adopted

Resolution on Reevaluation of Residency and Postgraduate Training This resolution asks that a committee be appointed by the House of Delegates of the American Medical Association to investigate and reevaluate the basic fundamentals of the present postgraduate and residency training programs, and insure some representative of specialists in private practice on the various specialty boards and physicians in private practice on the Councils of the American Medical Association. While your reference committee approves of the principles involved, it disapproves of that portion of the resolution suggesting that a committee be appointed.

Resolution on Professional and Administrative Audit of Hospitals

Dr Edward P Flood, New York, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals

WHEREAS Many small hospitals particularly in rural communities, do not receive the benefits of inspection by the Joint Commission on Accreditation of Hospitals and

WHEREAS Professional and administrative audits by the aforesaid Commission of small as well as large hospitals would tend toward improvement of medical care therefore be it

Resolved That the Board of Trustees of the American Medical Association is hereby requested to study the possibility of enlargement of the scope of the activities of the Joint Commission on Accreditation of Hospitals and if feasible to recommend such increase and to report to this House of Delegates at its annual session in 1954

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, submitted the following report, which was adopted

Resolution on Professional and Administrative Audit of Hospitals This resolution presented by Dr Edward P Flood of the New York delegation emphasizes the fact that many small hospitals, particularly those in rural communities, have not received the benefit of inspection by the Joint Commission on Accreditation of Hospitals, and recommends that the Board of Trustees of the American Medical Association be requested to study the possibility of enlarging the activities of the Joint Commission on Accreditation of Hospitals. Your reference committee approves this resolution and recommends that it be referred to the Board of Trustees for implementation by the Joint Commission on Accreditation of Hospitals.

Resolutions on History of Medicine

Dr James Stevenson, Oklahoma, introduced the following resolutions, which were referred to the Reference Committee on Reports of Board of Trustees and Secretary

WHEREAS Medicine plays such an important part in the shaping of human destiny through the initiation and activation of spiritual, intellectual and social economic values and

WHEREAS A thorough comprehension of the past in the field of medicine would facilitate the solution of many problems now vexing the medical profession and

WHEREAS The chastening influence of the history of medicine on individual members of the profession and its influence on the eager young doctor not yet seasoned by experience nor fully aware of his debt to those who have gone on before and

WHEREAS A wide dissemination of these simple facts about the evolution of medicine and its remarkable accomplishments in the face of mounting demands through mechanistic developments would do much toward a restoration of faith in medicine as now practiced in America and

WHEREAS The present mounting interest in medical history affords the American Medical Association an unusual opportunity to assume leadership in this field therefore be it

Resolved That the Trustees of the American Medical Association consider the advisability of establishing a committee or a bureau or other agency which shall be committed to the task of discovering sources, and

the accumulation and preservation of medical historical data and possibly the occasional publication of historical studies of interest to the members of the American Medical Association and of value to the public and be it further

Resolved That such a committee or other agency be instructed to cooperate with medical schools in the planning of courses in medical history and with state and county associations interested in local medical history

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr H Russell Brown, Chairman, presented the following report, which was adopted

Resolution on History of Medicine Your committee has carefully considered and is in sympathy with the intent of this resolution. It believes, however, that the objectives can be best accomplished by the appointment of a special committee by the Board of Trustees to study this problem and render a report of its conclusions within one year

Resolution on Regulation of Nursing in Veterans' Hospitals

Dr James Stevenson, Oklahoma, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals

WHEREAS In order to secure a higher grade of medical attention for their patients the Veterans Administration has entered into a system of cooperation and mutual aid with the various medical schools throughout the nation and

WHEREAS In connection with this arrangement a crisis has developed in the nursing situation. Many factors have contributed to the shortage of nurses but it is evident that in part the difference in the wage scale which is being paid by the Veterans Administration and that which is paid by the teaching hospitals has worked a hardship on the universities and their affiliated hospitals in that it has become almost impossible to secure adequate nursing personnel therefore be it

Resolved That the Faculty Board of the Medical School of the University of Oklahoma recommends that this situation be called to the attention of the American Medical Association through its Council on Medical Education and Hospitals and that all parties concerned working together reconcile these wage differences for nurses and thereby solve this trying problem in such a manner as may be helpful to and may avoid injury to the furtherance of the nursing profession

Report of Reference Committee on Medical Education and Hospitals

Dr Herbert B Wright, Chairman, presented the following report, which was adopted

Your committee considered the resolution introduced by Dr James Stevenson of the Oklahoma delegation to the effect that the attention of the American Medical Association be called to the wage scale which is being paid by the Veterans' Administration and that which is paid by the teaching hospitals arguing that it mitigates against civilian hospitals obtaining sufficient nursing personnel. Your committee feels that this is a matter which should be referred to the Board of Trustees

Resolution on Amendment of Federal Narcotic Act to Provide for Dispensing of Codeine Mixtures and Compounds on Oral Prescription

Dr Raymond M McKeown, Oregon, introduced the following resolution, which was referred to the Reference Committee on Hygiene and Public Health

WHEREAS Mixtures and compounds containing codeine, dihydrocodeine, or dihydrohydroxycodone in combination with other nonnarcotic medicinal ingredients are widely used for the relief of cough and mild pain and

WHEREAS Many patients need these mixtures and compounds on short notice after office hours and

WHEREAS Only mixtures and compounds containing not more than one grain of codeine per fluid or avoirdupois ounce are now included among exempt preparations under the Federal Narcotic Act and may therefore be dispensed by the pharmacist without a prescription and

WHEREAS For effective medication mixtures and compounds containing codeine, dihydrocodeine, or dihydrohydroxycodone in combination with other nonnarcotic medicinal ingredients often require these drugs in amounts greater than one grain per ounce and

WHEREAS The relatively limited possibility of inducing or sustaining narcotic addiction by the use of these mixtures and compounds is more than offset by the great inconvenience to patients, pharmacists and physicians caused by the provision of the Federal Narcotic Act which prohibits the pharmacist from dispensing these mixtures and compounds except upon a written prescription therefore be it
